The Nation.

NEW YORK, THURSDAY, JANUARY 2, 1908.

The Week.

The controversy as to whether hospital ships should be commanded by surgeons or line officers is nearly as old as the hills; and, as Surgeon-General Rixey points out, the army has long since decided it in favor of the Medical Department. To surgeons, the putting of a line officer over a floating hospital is analogous to putting a layman in charge of one on land. Moreover, the pacific character of a hospital ship requires that the commander shall be a non-combatant. This was the Japanese policy in the war with Russia, and, if we are correctly informed, is necessitated by recent action at the Hague Peace Conference. But the technical naval officer at once quotes the colloquy said to have taken place on the army hospital-ship Relief when a visitor asked for the captain. "Which do you want, the quartermaster-captain, the soldier-captain, the doctor-captain, or the captain of the ship?" There is no need for two of these, the soldier-captain and the quartermaster-captain, for soldiers are bound to obey the orders of a medical officer, and the quartermaster duties can be performed by an assistant surgeon, detailed as acting quartermaster. There must be a navigating master, of course. To our mind, he should be a civilian who would bear to the commanding surgeon the same relationship which the master of a yacht bears to its owner. The commanding of improvised hospital ships by belligerent officers has more than once done great harm to the patients. Civilian masters, be it noted, are employed on most of the navy's colliers to-day.

If the Reuterdahl charges, recently printed in *McClure's Magazine*, and the dispute between line and staff as to the command of the hospital ship shall lead to a reorganization of Navy Department bureaus, the outcome of present trouble will be happy. Some way of consolidating the bureaus should be found, so that public business may proceed properly, and a battleship commander may not receive conflicting orders as to sailing from a navy yard. The need of the hour is coördination; the House and Senate Naval Committees are reported to have discovered how antagonistic the bureaus are, or at least how independent of one another. There are seven of them, all vital to the efficiency of the fleet; if they pull together, they can accomplish much; if they work at cross purposes, the result is delay, waste, and inefficiency. Some time ago it was proposed to combine them into two great departments, but the project was defeated. As for the strife between the line and staff, it has been going on for at least fifty years; between the engineers and the combatant officers it grew so bitter that the two classes were finally amalgamated—an experiment of doubtful value, which certainly has not ended the bickerings. A Congressional inquiry would be just the medicine to cool the hot-bloods of the service, who are now crying out in fear lest Congress give them an investigation instead of four new battleships.

The whole country, we believe, is with the President when he insists that it is Nevada's business to protect life and property in Goldfield. As to immediate policy, Gov. Sparks has gained a point in securing the staying of United States troops for three weeks longer, while the President has forced the summoning of the State Legislature in special session. There is no disposition at Washington to do police work, however important, merely because a State government is feeble, indifferent, or timorous. But police work is, after all, only one branch of public activity, and the Administration which now keeps so strictly to its own sphere has been uncommonly ready to undertake tasks that had always been regarded as belonging to the States. We have heard in the last few years of many things which the States really ought to do, but which would not get done at all unless the Federal government did them. Protecting the food supply, animal and vegetable, curbing the railroads, regulating corporations, suppressing child labor, conserving the forests, developing the waterways, have been among them. We are not saying that what the government has done hitherto in connection with such tasks has been unwise. But the burden of proof has been so forced on the *opponents* of every extension of Federal function, that it is a satisfaction to have the opposite doctrine now insisted on so stoutly.

Every fair-minded man should welcome the bringing of a suit to test the President's right to discharge without honor the soldiers of the Twenty-fifth Infantry, for their alleged failure to confess the plot to "shoot up" Brownsville. The result of the Senate inquiry cannot be satisfactory, because the committee will split on personal or partisan lines. Moreover, the President and the War Department are bent on proving the men guilty, and are therefore far from being in a judicial frame of mind. This fact appears afresh in the recent dispatches. A week or two ago Senator Foraker discovered by chemical analysis that the bullets fired into the houses at Brownsville contained antimony, a substance that, according to the War Department's formula, is not used by the makers of the army bullets. Now Gen. Crozier, the Chief of Ordnance, triumphantly announces that there is antimony in all the army bullets. The makers, he now gladly shows, have long been violating their contracts. Thus Gen. Crozier's ordnance officers, who are appointed to see that the country gets what it pays for, have been negligent in not detecting the cheat. A similar desire to prove that its men were guilty has actuated the Department in the matter of identifying the rifles used. A court review will decide whether the President can violate the government's contract with a soldier on an unverified suspicion that he took part in some wrongdoing.

Other candidates may be boomed for the Presidency by clubs, committees, or conventions, but only Fairbanks is backed by a "love-feast." Last week the Indiana Republicans "in biennial love-feast assembled," praised his "poise" and "conservative courage," and called upon the country to elect him President. Let not the ribald make a mock of this. The very term, love-feast, indicates political strength. It is borrowed from Methodist practice, and recalls the fact that many a successful politician in the Middle West has been—we might almost say, has to be—a Methodist. Grant and Hayes and McKinley were of that denomination, as are a multitude which no man can number of Representatives and Senators. The reasons why the Methodist Church has been a mighty power in politics throughout the Central West, are bound up with the great material development of those States, and the rise of the children of the old circuit-riders and their parishioners to affluence. The denomination has become conscious of its power, and has used it. The result is that being "a good Methodist" is a valuable political asset. Without it, Fairbanks would be negligible: with it—well, there are several million Baptists also, and if it comes to a contest between Fairbanks and Hughes, the doctrine of falling from grace will have a hard struggle with the perseverance of the saints.

Here are the New England cotton-mills cutting down production by 25 per cent., and there is no man to shake his gory locks at tariff-revision and say thou didst it. Nor did "standing pat" prevent it. Senator Lodge ought to be seen about this. No statesman has explained to his thick-witted constituents more patiently than he, that to touch the tariff would be to make the tall chimneys stop smoking, and the turbines cease revolving. Well, the tariff is untouched, but business is not. What has happened to the Republican magic that its efficacy has thus failed? Inquiry ought to be made of President Roosevelt. A late convert is often the most zealous expounder of the faith; and as a former free-trader now become a pillar in the stand-pat church, Mr. Roosevelt ought to be able to explain why Providence has suddenly resigned as the leading member of the Republican party. Some one ought to put a question to Secretary Taft, also. He is a paulo-post-future tariff reviser, and elaborately argued in his Columbus speech that nothing should be done till after the next Presidential election, since if the subject were even discussed now, a chill would fall upon manufacturing industries, and our great goddess prosperity would feel outraged. A public man so in the secrets of destiny ought to be just the one to tell us why the high tariff is of no avail to prevent a panic and depression which the soothsayers of his party have assured us it would forever avert.

The War Department has advertised for bids on military airships in the same matter-of-fact way in which it might ask for proposals for stoves or wagons. If anybody can deliver a machine which is up to the requirements, our government will pay liberally; if not, it will go without. Surprise is expressed at Washington that the tests prescribed are considerably more rigid than those for the still unclaimed Deutsch prize. Yet they look to the only type of airship which would be of any real use in warfare. It must be able to navigate against the wind, to stay in the air continuously for an hour, to make a speed of forty miles per hour, to ascend under any conditions, to land in a field without damage, and to be manageable by any operator of reasonable expertness. There has been much enthusiasm over the European successes with propelled gas-bags, but the machine of practical utility must certainly possess all the qualities which our authorities have noted in their memorandum, if not more. Whether it would have been wiser to encourage inventors by offering rewards for partial successes—as Congress subsidized the Langley aerodrome—is a question of policy. The War Department has decided not to spend money for playthings. If it should succeed in obtaining the first real flyer, the result would be both a vindication and a triumph.

One of our readers wrote recently to inquire whether the enlightened self-interest of private forest-owners would not be a stronger force toward the perpetuation of our forests than any governmental regulation. "If private management of enterprises generally is conceded to be superior in foresight and economy," he asked, in effect, "why should it be assumed that forestry is an exception to the rule?" It is, indeed, customary to point to the growth of forestry schools and the general employment of trained foresters by lumber companies, and other users of timber, as evidence that the country has at last seen the error of its ways. Conclusions like these, however, though sound enough in some ways, need still to be qualified. As Ernest Bruncken points out in the current number of *Forestry and Irrigation*, the scientific forestry of to-day "is still principally 'extractive' forestry, the harvesting of the supply furnished by unaided nature, only some care is taken to avoid unnecessary waste." "Productive" forestry, which looks toward securing a new future supply, "is still a rare exception in this country." What the American forest offers to-day is practically government-bond interest with lumber-yard security. Fire is an ever-present danger, and systems of taxation have yet to be adapted to the culture of so slow-growing a crop as the lumber-yielding trees. Added to these factors is the temptation to anticipate future profits. Our forests, it is estimated, will supply our industrial needs if they can be made to yield thirty cubic feet of lumber per acre annually. The annual growth at present averages far less than that—some say as low as ten feet to the acre, though European countries have proved it possible to produce much more than thirty. The owner of an American forest to-day must either content himself with cutting only the annual increase, which will provide him but the smallest return on his investment, or else cut more than the annual growth, and thus in time destroy his forest. By doing the latter he can probably make generous profits during all the time that he, personally, is likely to need the money. It is this condition which has made students of the subject practically a unit in advocating public control. This does not mean that private interests are having no part in the great work of "conserving our natural resources." Industrial corporations, plagued by the rising price of wood, have protected themselves extensively by buying woodlands. The railways East and West have planted millions of young trees which will furnish the ties of the future. The paper mills own tracts of forest, as do some of the furniture factories. It is in connection with these special uses that the conservative tendencies through private agencies are best seen.

"Alcohol," so the dictionary informs us, "is a powerful stimulant." We would suggest, on contemporary evidence, that the mere idea of alcohol—denatured alcohol—is a stimulant also. Otherwise, why have the prophecies of cheap industrial alcohol for this country gone so wofully wrong? Two years ago Congress removed the tax from industrial alcohol. One year ago it so far removed other restrictions that the farmer could manufacture alcohol in his own backyard without maintaining a Federal inspector on the premises. Spurred by this doubled generosity, the 10,438,217 persons engaged in agricultural pursuits have, among them, set up exactly ten stills. This is in approximately the ratio of one to the million. In Germany there is a still to every 120 farmers and farm workers. Various explanations are given of the fiasco. Some say we need new patterns of lamps and stoves, some that we need more thrift, some that we need a tariff, though how a tariff can defend the farmer against the competition of native petroleum is another matter. Farmers are not the readiest people in the world to avail themselves of such brand-new opportunities as this, and it may be that if the daring ten are successful, ten thousand will follow their lead next year. Even if they do not, it is no argument against the wisdom of removing needless restrictions from what may be an important industry.

The leader of the New York Oratorio Society makes a proper but, we fear, hopeless plea for the recognition of other oratorios than the "Messiah." He contends that oratorio-goers have not done, as they seem to think, the whole duty of man, when they have gone piously through their annual pilgrimage to the shrine of Handel. But ingrained habit cannot be overcome by the most convincing argument. Just as there are thousands of people to whom a book means a novel, so there are excellent thousands more to whom an oratorio means only the "Messiah." You may talk to them till your breath is gone about "Gerontius" and the "Vita Nuova," but the very existence of such works they will go on blissfully ignoring. We can only wish Frank Damrosch success in his efforts to broaden the musical taste of his public, but it is an up-hill work which he has undertaken. Indeed, if he were actually to compass such a revolution, he would destroy one of our most venerable definitions of a certain order of citizenship—the man who has mutton-chop whiskers, wears "spats," dines at twelve o'clock, votes the straight Republican ticket, and goes to the "Messiah."

The agreement finally arrived at between the Foreign Office at Tokio and the Canadian Minister of Labor may be regarded as ending the present phase of the anti-Japanese movement in Canada and this country. Without abandoning any of its treaty rights, the Mikado's government has agreed for the future so to "control" emigration as practically to prohibit the influx of laborers into Canada. A similar agreement is on the point of conclusion with our own Ambassador. Wise foresight counsels Japan, while yielding to the present outburst of anti-Japanese feeling on the American Pacific Coast, not to abandon rights which may prove valuable when the present agitation shall subside. If Asiatic emigration is as sensitive to economic conditions in the United States as European emigration has recently been, the task of holding back the Japanese from America should not now be difficult.

The Central American republics have searched their hearts thoroughly, and for every transgression they have concluded a treaty. No less than eight separate agreements are the result of the recent conference in Washington. The final treaty, in which the signatory Powers pledge themselves not to recognize any government established in a neighboring state by violence or other extra-Constitutional means, shows with what painful anxiety the conference delegates sought for guarantees against their own weaknesses. Yet the efficacy of the new treaties will depend largely on the influence which the United States and Mexico, as officially recognized friends, may come to exercise. That Central America itself may grow distinctly more sober in the near future is not improbable. The very conference at Washington is indicative of aspiration for more stable government and the resulting industrial development.

The reason given by Lord Curzon for his decision to enter the House of Lords as a representative Irish peer, instead of seeking a seat in the Commons, embodies, unintentionally perhaps, as biting a criticism of the British upper house as any Radical politician has lately been known to utter. It had long been his ambition to enter the House of Commons, declared Lord Curzon, "but the strain of his work as Viceroy had proved too much for his strength, and the opinion of his medical advisers had driven him reluctantly to the conclusion that he could not reënter that House." Among the legislating peers, of course, there is no probability of Lord Curzon's endangering his health. Convening as they ordinarily do at 4:17 P. M., and adjourning at 4:45 P. M., no overstrung or fever-eaten servant of the Empire could find the pace more than the gentle exercise needed to keep up one's interest in life. In Lord Curzon's case, it is a misfortune that ill-health should prevent his entering a sphere where his great powers could best be exercised. On his return from India two years ago, Curzon was looked upon as the man who might rehabilitate the fortunes of the Unionist party, standing apart as he did necessarily from either faction, Chamberlainite or free-trade. Whether Arthur Balfour would have been entirely pleased with the presence in the House of Commons of a political heir whose importance was derived in part from the fact that his views were different from Mr. Balfour's, is a question.

The arrest of the Irish member of Parliament from Westmeath after he had been condemned to six months' imprisonment for contempt of court, shows that the Liberal Government has finally been spurred into taking cognizance of the cattle-driving agitation in Ireland. Mr. Ginnell, the imprisoned M.P., has been the most outspoken advocate of that method of coercing the landlords into placing their pasture lands on the market for purchase through the Land Commission. To force the government to take action, has been the object of the cattle-drivers, and if they have not accomplished all they have expected, they have certainly brought the question squarely before the public. The martyrdom of Mr. Ginnell should not matter greatly. In fact, it helps a Nationalist cause to be able to point to its confessors now and then, and Ireland without one or two members of Parliament who have worn stripes would be like Germany without any incarcerated Socialist leaders, or France without a Monarchist felon or two, or Hungary without a jailed Croatian Deputy. At the same time, the Liberal Cabinet incurs no particular odium for arresting and trying by due process of the law a man who has been clearly guilty of disturbing the public order. That the Irish Parliamentarians are confident of the future would seem to be indicated by the impending reëntrance of William O'Brien, the dissident member from Cork, into the Redmond ranks. A little disunion, a little public disorder, a new bill, reunion, and peace, and then over again—that seems to be Ireland's slow and painful way towards better things.

Berlin's two Harden trials have aroused a good deal of pleasurable emotion on the other side of the Rhine. French public feeling seems to be growing sensitive about the "holier-than-thou" attitude which the rest of the world maintains towards the wicked Gaul. In the case of Great Britain and the United States, the French are attempting to vindicate the general character of their misunderstood literature. As for Germany, Frenchmen make use of an emphatic *tu quoque*. The well-known critic, Gaston Deschamps, in a recent review of the philosophy of Alfred Fouillée, took occasion to draw up a formidable indictment against the spirit that animates modern Germany. Deschamps asserts that, with all her supposed vices of the body, France has nevertheless remained the country where the "idea"—the idea of justice, of internationalism, of humanity, of the superiority of right over violence—has retained its sway. German science and learning, on the other hand, have surrendered themselves to the vindication of brute force over moral ideals. German savants have been Jingoes and worse. Mommsen, in his deification of violence, cunning, and success as personified in Julius Cæsar, is really the progenitor of Nietzsche's frank anarchism. When the war of 1870-71 broke out, David Strauss, author of the "Life of Jesus," was one of those who cried loudest for the utter annihilation of "debauched" France; and it was a Frenchman, Renan, who addressed to the enraged theologian an exquisitely moving letter, in which he deplored, without anger, that one whom he revered as his *maître* should be also his country's enemy.

The Russian government, like every honest and staid man of business, has been actively paying off its old debts and balancing its books for the New Year. Not long ago it squared accounts with twenty-seven members of the second Duma, who received, in full payment of their claims, varying terms at hard labor in the mines and Siberia. Last week, it began negotiations with no less than 169 of its creditors, all members of the first Duma, who signed the celebrated Viborg manifesto in the summer of 1906. The 169 deputies, all charged with high treason, include the president of the first Duma, its vice-president, and the leading men of Russia in every intellectual field. Unlike some American depositors, these creditors of the Russian government are pretty sure of getting what is coming to them. Three years' imprisonment and the loss of civil rights is a fair dividend. Having disposed of the claims arising from the first Duma, the Czar may go still further back, to the leaders of the professional unions which combated the manifesto of August 19, 1905; to the leaders of the Zemstvo Congress who demanded Constitutional government in December, 1904; and so finally, perhaps, to the leaders of the previous Zemstvo Congress, which, without mentioning Constitutions, dared to appeal for relief from intolerable conditions. The Czar has still twelve days until *his* December 31 comes, and in that time an active and determined autocracy may accomplish much.

IMPERIAL FATALISM.

A foreigner can put some things more bluntly than a native likes to. In a recent address by Lord Curzon, he stated the case of American Imperialism in a way which is more truthful than flattering—though he did not intend to be in the least uncomplimentary. Lord Curzon knows this country well. It is evident, too, that he must have kept himself informed of the movement of public opinion among us; for he is aware that the bloom is off our first Imperialist enthusiasm. Lord Curzon declared that, in his belief, if this country could now be polled on the issue of Imperial expansion, "a large and possibly an overwhelming majority would be against it." Yet he went on to say that circumstances are too strong for this puissant people. They are caught in the toils, and cannot escape. They will do nothing except to moan at their own helplessness. Political parties might denounce the policy entered upon after the Spanish war, as "the more thoughtful Americans might deplore it," but no President and no Congress would take steps to revoke it.

What Lord Curzon was really after was an argument to bring to bear upon Englishmen. They have lately shown signs of lagging in the Imperial struggle. The weary Titan would like to lay down a part of his load—is, indeed, already doing so in South Africa. But this will never do. John Bull must be flogged to his task, and Lord Curzon reaches for the whip of American example. If even a nation with "so little of the instinct of militarism or aggrandizement as America" is swept into the vortex of Imperialism, and finds herself utterly unable to get out, how can England hope to hold aloof from a movement which is so plainly world-wide, and so charged with inexorable fate? We will leave Englishmen to answer that question for themselves; what concerns Americans is to decide whether it is true that they have become slaves of "the strong god circumstance."

It is too late, now, to go back to the might-have-beens. We cannot undo the past, but we can mend the present. For our part, we shall never agree that the annexation of the Philippines was inevitable; but that is now a vain dispute. The islands are ours, and it is for us to say what we shall do with them. And there certainly could be no more bitter humiliation for a great country than to tell it that it cannot do what it wants to with its own property—and this, not because some other and stronger Power forbids, but because the national will and vigor are paralyzed by a mysterious and unescapable fate. This is the doctrine of Imperial fatalism. We are not the lords of our own souls. A strong man has entered our house and bound us, and we have to do his bidding. The national preference is powerfully in one direction, but the national action must be wholly in the opposite. The *vox populi* goes for nothing.

Now, if we are compelled, as Lord Curzon thinks, to lie down ignominiously before a hated Imperialism, then that subject stands apart from all others in the political field. Everywhere else, the argument is that, if we have got into a mess, we must set to work to get out of it. As regards what other matter could it be said that a large and even overwhelming majority of the voters must remain powerless to translate their wishes into action? We have not been bred to think ourselves so fettered. In the spirit of our own ancestors we have been accustomed, when some nerveless man breathed the pious wish, "Well, God mend all," to reply with energy, "Nay, but we'll help him to mend it!"

Any vigorous and self-respecting nation ought to regard it as a libel to say of it that it is so hampered by circumstances that it cannot do justice, cannot deal with great problems in accordance with its own fixed principles. But nobody asks of Americans that they should do anything for the Philippines but treat them in the American way. And there is a visible and strengthening movement to do that very thing. The United States is neither so helpless nor so despairing, in this business, as Lord Curzon imagines. Plans to withdraw from the Philippines are broached and pushed as never before. Resolutions to that end crowd the calendar of Congress. So far from being a closed question, it is more open than ever. There has been, and there still is, much popular indifference on this subject. This is partly the mortified reaction from the ignorant vainglory of 1899. Those who then shouted with joy over the Philippines, now do not want to hear a word about them. But the Americans who to-day are active at all in the Philippine question, are almost all in favor of ending our expansion in the Orient as speedily as may be. Whether by neutralization, by a mere protectorate, or by granting independence outright under suitable guarantees, the thing is urged to-day by more men of more influence than at any time since the war with Spain. Americans have not yet become quietists. If they have made up their minds, as Lord Curzon admits, that Imperialism is a failure, they will find a way to end it.

CAPITAL IN FIXED FORMS.

The recent course of the money market illustrates the old difficulty of periods just before prosperity culminates —the community tends to convert its savings too rapidly into fixed capital. The need of new plants for manufacturing and of new means of transportation becomes so pressing, and promises such generous returns, that the creation of new stock companies for such purposes, with the issue of new securities by old companies, goes on at a bewildering pace. The result is that the capital left available for carrying on the ordinary processes of production—in the form of raw materials, wages of labor, consumable goods in process of marketing, and banking resources—becomes at length inadequate. The supply of surplus capital thus becomes deficient for both purposes—for carrying on current production on the one hand, and for the creation of new enterprises on the other. New issues of stocks and bonds cease to find ready purchasers, and the surplus of these new securities reacts upon security prices all along the line.

The distinction between fixed and circulating capital has been obscured in recent years by the fact that fixed capital acquires a character readily negotiable when put into the form of securities. This makes the titles to fixed property easily transferable from one person to another, but does not change the form of property itself. Securities as a rule do not represent circulating capital, in the economic sense of the word. Commercial paper represents such capital, because it is the outcome of the conversion of raw materials into consumable goods, and the entire operation is completed within a limited period of time. Essentially different in character are loans upon Stock Exchange collateral. So carefully organized is the system of loans upon securities in the New York market, and so amply protected are sound banks and trust companies by the margins which they require, that many bankers have lulled themselves into the idea that such loans are as safe as loans upon commercial paper, while more negotiable. For practical purposes and under normal conditions, this is to a large degree true; but there is an economic error in the popular view of the character of such loans.

When Union Pacific stock rises from 168 to 195 in the course of a few weeks, as occurred in the summer of 1906, the increased amount of money required to buy 100 shares is simply an increase in the investment of fixed capital. If this be taken from the existing fund of savings, it diminishes the fund available for current production. So long as everything goes well, the holder of such securities finds them as convertible into cash as he would find commercial paper, but if it becomes apparent that too much capital has been put into permanent forms, those who wish to get it back into the form of circulating capital may be compelled to make serious sacrifices. This distinction has been so much obscured by the convertible form of stocks and bonds that its real significance has almost escaped the attention even of our most enlightened and far-sighted captains of finance.

The existing absorption of saved capital duplicates in a mild way that of 1857 and that of 1873. All available capital has been taken for extending plants or building new ones, and no more can be obtained for such purposes without trenching upon the stock of circulating capital necessary to carry on the operations of the community. This condition may arise, even though all the investments in the form of fixed capital are sound. The community is in the position of the individual who may be convinced that a new invention or an extension of his business involving an investment of $50,000 will bring him profits of hundreds of thousands; but he is helpless if he lacks the $50,000.

If conditions at present require the cessation of further railway extensions and other business improvements because of the lack of capital, the results are certain to be felt in many lines of production and distribution. Maladjustment of supply to demand will follow in many fields the curtailment of operations. If, for instance, the demand for steel rails relaxes very greatly, workers in the rail mills will be without employment; their demand for goods will fall off; and if similar conditions extend through varied industries, other workers will be thrown out of employment and will diminish their demand for goods. Distributors of commodities will begin to cut prices to get rid of their goods for cash, and producers will cut down production in the face of diminished demand.

The country is to-day in a plight very different from previous periods of depression. Our monetary system is sound, the leading manufacturing and railway corporations have surplus reserves of cash and credit, and production has not apparently outrun the reasonable anticipation of future demand. Those railroads and other corporations which have, however, postponed new bond issues and other appeals for capital, are undoubtedly acting wisely in diminishing the pressure for converting the savings of the community too rapidly into fixed forms.

COAL-MINE DISASTERS.

The United States Geological Survey brings out a report on "Coal-Mine Accidents, Their Causes and Prevention," at a time when the memory of two recent mine disasters is still fresh. The information here contained gains rather than loses in interest from the fact that it is not the result of a special sensational inquiry, but came from studies "carried on in connection with the general investigation of the waste and destruction of coal in mining operations."

In this instance the work of trained investigators supports the popular belief that something is radically wrong when accidents like those of the last few weeks can occur so frequently. Coal mining, of course, must always be hazardous; and, generally, a more or less plausible explanation is offered to prove that the accident is "unavoidable." The figures presented in this report, however, make it incredible that this country's unenviable record is purely the result of ill luck. In the first place, the authors of the bulletin, Clarence Hall and Walter O. Snelling, declare:

> It is very doubtful whether natural conditions in any other country in the world are so favorable as in the United States for getting out coal with the minimum amount of danger to the workmen employed.

More of our developed coal properties than in any other country present "almost ideal conditions for mining." Nevertheless, in the last five years for which statistics are available, there were killed in our mines an average of 3.39 every year to every thousand employed, as against 2.06 for Prussia, 1.28 for Great Britain, 1.00 for Belgium, and .91 for France. What is more, our ratio of accidents has increased, while those of all these other countries have been materially reduced, as is shown by these figures, taken from more extended tables:

	Killed per thousand employed.	
	1895.	1906.
United States	2.67	3.40
Prussia	2.54	(1904) 1.80
Great Britain	1.49	1.29
Belgium	1.40	.94
France (1901)	1.03	(1905) .84

The ratio of deaths to the tonnage of coal mined has varied greatly from year to year in the United States without showing a steady tendency in either direction. In Great Britain, France, and Belgium it has within the same period decreased almost continuously. In absolute numbers, the return is that in the year 1906 there were 2,061 men killed in American coal mines and 4,800 injured. Since 1890, our total death record has been 22,840.

Why has mining become more dangerous in the United States, while it became safer everywhere else? Joseph A. Holmes, in charge of the technologic branch of the Geological Survey, in an introduction to the present bulletin, makes this summary of causes:

> This increase has been due in part to the lack of proper and enforceable mining regulations; in part to the lack of reliable information concerning the explosives used in mining, and the conditions under which they can be used safely in the presence of the gas and dust encountered in the mines; and in part to the fact that in the development of coal-mining not only is the number of miners increasing, but many areas from which coal is being taken are either deeper or farther from the entrance, where good ventilation is more difficult and the dangerous accumulations of explosive gas more frequent.

Needless to say, the last-named reason applies with even greater force in the older mines of the European countries.

Last year's accidents in this country were classed under four causes. Of the deaths, 1,008, or about half, and 1,863 of the injuries, were caused by falls of roof and coal; 228 deaths and 307 injuries by gas and dust explosions; 80 deaths and 215 injuries by powder explosions; and 732 deaths and 2,192 injuries from "other causes." The restrictions imposed in foreign countries on the use of explosives were originally designed for the prevention of explosions of gas and dust; but they have had an equally gratifying effect in preventing falls of roof and coal. In Belgium, for example, where "fire damp" is exceptionally troublesome, the death rate from explosions has been reduced to one-tenth what it was thirty years ago, while that from falls of roof and coal has been reduced in the same period from .661 to .406 per thousand. The details of the various regulations which have proved effective abroad are matters for expert judgment. In general, experiments have shown that some explosives are much safer than others of equal power. Experiments have also been made to ascertain the charges which may be used without excessive danger. The miners' safety lamp, of course, is familiar to every student of elementary physics. In applying these scientific results the European authorities have been zealous where ours have been lax. They provide for the periodical testing of safety lamps, license certain kinds of explosives, and sometimes require that all charges be placed by expert "shot-firers." In some places sprinkling of the mine passageways is required, in some the installation of rescue tanks of compressed air or oxygen. Finally, inspection is in general more thorough, and penalties for violations of regulations are enforced more strictly on both miner and operator.

To be sure, peculiar conditions are to be reckoned with in this country. Most of our mine workers are foreign-born, and a large proportion do not understand English. Many are inexperienced, and many more careless. With the best intentions in the world, the strict enforcement of regulations cannot be easy. Nor is our national temper favorable to extreme caution. Some of the factors of haste and recklessness which make our mines exceptionally dangerous are to be found also in our railways, our factories, and our methods of building. It may be too optimistic to affirm, as the Geological Survey expert does, that "these mine accidents may be reduced to less than one-third their present number in the United States," or that there is "promise of results which in the future may at least approach complete prevention." No doubt, however, if Legislatures, and the mine-owners as individuals, would only profit by the lessons which other countries have learned, conditions could be vastly improved.

THE INSTITUTIONAL CHURCH AND PREACHING.

A series of articles on "The Social Work of the Church" almost entirely fills the latest *Annals* of the American Academy of Political and Social Science. Certainly, the extraordinary and continuing growth of these forms of religious activity merits such a comprehensive survey. Men and women in the thick of the work, here bring together their various reports, criticisms, and proposals. None of them speaks with more authority, or a clearer philosophy, than the Rev. Edward Judson of this city. Himself at the head of an institutional church of multiform effort, he is the frankest of men in stating the reason of its being. It is "adverse environment" which compels a given church to "institutionalize." The ordinary religious appeals wholly fail; and so the church has to turn to educational, charitable, and social endeavor. Besides the religious services on Sunday, it has to take up such tasks as Mr. Judson specifies in his own field of labor—"gymnastic classes for women and girls, gymnastic classes for men, gymnastic classes for boys, boys' clubs, singing classes, sewing school, children's hour with the stereopticon and moving pictures, men's tea on Sunday nights, Young People's Literary Society, and so forth."

With every aim of this sort at the physical, mental, and social betterment of people who will not go to church, but flock to clubs, no man of just feeling can fail to sympathize. If it breaks with the old tradition, it allies itself with the new humaneness. Though it may seldom satisfy those who wish to bring sinners under pious influences unawares, and make philanthropy a lure to religion, yet the incidental benefits remain. Incidental disadvantages also necessarily accrue. One of them is, undoubtedly, a lowering of the prestige of preaching. The institutional church tends in two ways to rob the pulpit of its glory: it subordinates the sermon, even when it is good, and, by its tax on the time and strength of the minister, makes the good sermon still rarer.

It might not be possible to work out a causal connection between the two, but it is at least suggestive that the great heightening of the social function of the church has gone with a decline in the reputation of the preacher, as such. One does not need to have a very long memory to recall the time when the names of eloquent preachers in this city counted for more than the designation of their churches. The visitor over Sunday knew in advance of the "men worth hearing." To "hear" Mr. Beecher or Dr. Storrs, John Hall or Dr. Taylor, was an object with many in coming to New York at all. It seems safe to say that, with the possible exception of Dr. Parkhurst (and his fame is different in kind from that of the others mentioned), no name stands to-day for that kind of attraction to the sojourner in New York. Strangers nowadays go to church; they do not go to listen to renowned pulpit orators.

In individual cases, at least, the breaking down of the preacher by the cares of the administrator, seems clearly traceable. It may have happened in the old days that a clergyman was invisible all the week, and incomprehensible on Sunday; but to-day the trouble is apt to be that he is only too visible all the week, "running" the church, and exhausting his nervous energy in serving tables to such an extent that he is in speech contemptible on Sunday. You cannot plough with a race-horse and expect him to keep his speed. A man absorbed in business for six days, cannot emerge as an uplifting speaker on the seventh. An orator must be *plus* who hopes to be a true master of assemblies—not one whose thoughts and spring have been drawn down to *minus* by exacting labors as a collector of funds and a manager of clubs. The great preachers have been seers who were given leisure through the week in which to dream their dreams and shape their prophecies. But the institutional church leaves the clergy no time even to think.

The church cannot afford to still the voice of her prophets. Christianity has been preëminently the preached religion. Its Founder sent forth the Apostles to preach. All through the history of the Christian Church, the living utterance of spiritual men has been the great corrector and quickener. Inspired preaching has in it the greatest power known to man—that of a kindled personality. It is the most potent fascination which anything exterior in the church can wield—more vivid than music, more direct than even grand architecture and fit adornment of the temple. With the right man in the pulpit, allowed time for brooding thoughts and careful choice of form, nowhere else can speech be so clothed upon with power. If the institutional church were inevitably to degrade that great Christian function to the droning of imbecilities, its condemnation could not be too strongly pronounced.

This, however, is by no means necessary. A division of labor would meet the difficulty. Means should be found to maintain and even extend the social activities of the church, without crushing the born preacher under a burden of administration grievous to be borne. If the institutional church is finally to justify itself, it must provide methods and money by which the organizer and the superintendent may be set apart for their special work, while he whose lips have been touched with a live coal can be free to flame and thunder in the pulpit. We ourselves believe that dearth of great preachers is only temporary. The high themes are there; the human heart remains the same; the opportunity and the aspiration appeal to lofty natures as of old. A time of theological break-up is apt to be sterile in eloquence. Doubt chokes full utterance. But when the servants of the church find their mental footing firm again, we shall once more hear the sincere and moving human voices which, from the beginning till now, have best carried Christian truth into the hearts and lives of men.

THE COLLEGE GRINDSTONE.

The recently published "Life and Letters of Sir Richard Jebb" must fill the occupants of academic chairs in America with envious despair. This picture of the life of a college professor in Great Britain is far different from that of the college professor in America. It is different, of course, from that of the average university teacher in England; for Jebb was a man of exceptional parts; he was able to do large amounts of various kinds of work—teaching, investigating, lecturing, and writing—all of it brilliant. Nevertheless, he represents an ideal of accomplishment and achievement toward which the English university teacher more or less consciously strives. In America, on the other hand, this notion of the scholar and man of letters combined in one person is but dimly conceived by most members of the academic body; and it has apparently never entered the heads of many college trustees. We have had a Longfellow and a Lowell; and among the living we might name a few more who enjoy something beyond parochial fame; but the vast majority can hope to be nothing more than competent teachers and the editors of useful text-books—a respectable but not an inspiring career.

The reasons for this shortcoming—if we may use so harsh a word—are not far to seek. We need only refer to the fact that in but few places in this country is any tradition of culture firmly established. We have not half a dozen university seats where a man like Jebb would have received strong encouragement, to say nothing of stimulation. Moreover, he would be something of an alien within the university itself. The steady mediocrities and the glib talkers who figure so largely in our boards of trustees and who are not infrequently chosen to college presidencies, are naturally biassed by an unconscious but none the less genuine distrust of men who are not of their own kind. These authorities, though they nominally desire to encourage scholarly production, really like best the solid teacher who carries a huge amount of class and committee work capably and without flinching, or that other one who dissipates his energies in keeping the college constituency "warm"—talking at all the teachers' meetings and similar gatherings. These are the activities that, in the eyes of college administrators, actually count, and therefore win solid rewards. Nor is this surprising. Most American colleges are much straitened for money. The one thing which they must do is to maintain the classroom instruction as well as may be, and keep growing in numbers so as to appeal to the public as an institution deserving of more liberal support. To these two ends other aims are, by the pressure of a growing population, clamorous alumni, and an empty treasury, ruthlessly sacrificed.

To the merchants, manufacturers, and bankers, who constitute the backbone of our intelligent and public-spirited boards of trustees, it appears absurd that a professor should find fifteen or twenty hours of class-work a week a heavy load. Three or four hours of teaching or lecturing a day, for nine months in the year, seems to your business man mere play. Yet the truth is that six or eight hours a week of first-rate class work, informed as to the latest results of research, thoroughly digested, and carefully presented, will keep a professor busy. If he attempts more, he degenerates into a machine; he offers the same lectures and cracks the same jokes year after year. That is, he has no chance to refresh himself, to get new points of view, in fine, to think. For the professor the time spent in experimentation that is not immediately productive of striking results, in reading, in mulling over his ideas while he walks, plays golf, or rides the bicycle, and in discussing with a colleague the newest theory as to the constitution of matter or the recently discovered fragment of Menander, is not pure loafing or genteel recreation. This is the very process by which he subjugates his facts, assimilates his learning, and ripens his scholarship. But the unhappy truth is that thinking is a luxury in which our average underpaid and over-driven college teacher cannot afford to indulge. Whatever his personal inclinations, he knows that the people to whom he must look for approval, for means to extend his department, for library books and laboratory apparatus, for bread and butter for himself and his children—that these people are primarily interested in other things; and that he is at liberty to do only so much thinking as is compatible with devoting all his time and energy to classes and committees.

Of Jebb at Glasgow we read that his work was heavy, but that the six months of vacation were priceless. In them he wrote for the better English periodicals, brought out his "Attic Orators," composed his book on Bentley, visited Troy in order to study Schliemann's theories, wrote his "Introduction to Homer," and published his Sophocles. To this statement our hard-headed American administrator may reply that if a man has in him the stuff of great scholarship, if he really has a message for the world, he will find a way to deliver it. True, men of extraordinary capacity will surmount all obstacles; but that is not precisely a reason for putting obstacles in their way. We grant also that a capable teacher is more useful than a tenth-rate author. But there is much writing, now tenth-rate, that might be solid and valuable, though not necessarily inspired, had our college professors the opportunity to make the most of their material, and, indeed, of their own minds. We grant also that too much leisure might make dilettantes of those teachers who fancy they have a strong bent toward literature simply because they are too lazy to do anything but sit and read a book or amuse undergraduates with slap-dash generalizations. Creatures of this type will never be chosen to a college faculty by a president who is a keen judge of men. These dangers that we have mentioned are, however, negligible. The plain fact is that under present circumstances a college career offers too few attractions to men of intellectual energy and ambition. If they are to be teachers, they should enjoy teaching; but that pleasure is destroyed by the consciousness that the task is perforce done poorly. And even if the teacher can offer the world no important by-products—a process which may do much to expand and broaden both him and his pupils—he must at least be allowed to keep himself flexible and alert by wide intellectual ranging. For how many college teachers in America is it even physically possible to keep the teaching up to the highest standard, to say nothing of undertaking such scholarly enterprises as Jebb's? For not one in twenty.

MODERN LANGUAGE ASSOCIATION.

COLUMBUS, Ohio, December 28.

At the twenty-fifth annual meeting of the Modern Language Association of America, which has just been held at the State University of Ohio, the attendance was large, Western men naturally predominating, but with a goodly representation from the East. From the opening session to the very end, every reader had a sufficient audience. in spite of the inevitable and agreeable congregation in the lobby. There were the customary social affairs, including a reception by President and Mrs. Thompson, and a humorous, though partly serious, "smoke talk" by Prof. Josiah Renwick Smith.

Among the papers on the philological side special mention should be made of "Some New Facts About a Manuscript of 'Godefroi de Bouillon'" by Prof. Hugh A. Smith of Wisconsin and "The Syntactical Development of the Spanish Second Imperfect Subjunctive" by Dr. Arthur R. Seymour of Illinois, investigations of too technical a nature for summarization here. But while there was the usual quantity of special studies on linguistic details, origins and analogues, sources, manuscripts, dates, and authorship, a majority of the papers, as has been the custom in recent years, were, in both topic and treatment, of general interest. A few only can be more particularly referred to. Prof. Thomas S. Baker of Jacob Tome Institute, discussing "Early Conceptions of America in European Literature," pointed out that in this respect America had its greatest intellectual value while still uncivilized. The New World was then regarded as a Utopia, where freedom, courage, dignity, and happiness were striking features of Indian life. Just at the time when the spirit of the revived classical antiquity was losing its freshness and force, came the scientific, poetic, and philosophical influence of the explorers, and of the literary men inspired by their works. Prof. Robert H. Fife, jr., of Wesleyan gave an interesting literary review of the German *Märchen*, leading up to the determination of that impalpable quality which, however diverse may be the species bearing the name, from the satiric to the naïve, is still distinctively present in all types. This quality he found to be the suspension of the logical faculty under the sway of childlike fantasy. A study by Prof. John M. Clapp of Lake Forest College, showed conclusively that, contrary to all received opinions, there was in England between 1660 and 1700 an astonishing production of short novels which were chiefly based, not upon the heroic romances hitherto considered the dominant form of fiction at that time, but upon the shorter and more realistic *nouvelles*. Another long standing misconception was overthrown by Prof. Edward P. Morton of Indiana who, in his paper on "Non-dramatic Blank Verse Between Milton and Young," demonstrated the fact that the prevalence of the heroic couplet had by no means precluded an extensive production of non-dramatic blank verse. The influence of Milton was in fact dominant in a considerable number of poems composed by his immediate successors, and Addison's praise of "Paradise Lost" actually voiced a general judgment. "Elizabeth Barrett's Influence on Browning's Poetry" was the subject of Prof. J. W. Cunliffe of Wisconsin. With sure critical instinct and remarkable literary charm, Mr. Cunliffe traced to the intimacy of spiritual communion in the poet's married life his growth in human sympathy, passionate fire, and lyrical beauty. It might even be said that Mrs. Browning's best work is to be found, not in her own poems, but in those of her husband.

The Presidential address, "The Genesis of Speech," by Prof. Fred N. Scott of Michigan, deserved and received unusual attention. Whatever view may be adopted concerning this obscure matter, such a sane, learned, and methodical discussion, always distinctly separating theory from fact and assigning to each its due weight, cannot fail to be of value. The starting point of the argument was the division of all bodily movements on grounds either of utility or of expression, the former often passing into the latter and thus giving rise to gestures, to muscular contractions, to disturbances of respiration, and in this way ultimately to significant vocal sounds. The exposition was clear and orderly in each step, the illustrations abundant and original, and the complicated evidence was unfolded, and finally reduced to simplicity and definiteness by the picture, confessedly imaginative, of a mother and child teaching each other the elements of the earliest human language.

At the business meetings two important matters were taken up. On motion of Professor Cunliffe, a committee was appointed for the promotion of the following aims: (1) The acquisition of photographic reproductions of earlier English texts by American university libraries; (2) the circulation of index cards of reproductions so acquired; (3) the cataloguing of original English texts prior to 1660 in public and private libraries in the United States and Canada; (4) a consideration of the feasibility of doing the same for texts in other modern languages. The members appointed to this committee were Professors Cunliffe, C. M. Gayley of the University of California, J. M. Manly of Chicago, H. A. Todd of Columbia, and G. L. Kittredge of Harvard. At the same session was adopted a resolution introduced by Prof. E. C. Roedder of Wisconsin, that it is desirable to adopt some plan of obviating, as far as possible, the duplication of work in doctoral theses intended for publication. Prof. William H. Carpenter of Columbia will bring the matter before the Association of American Universities, which meets at Ann Arbor on January 9. Prof. Charles H. Grandgent of Harvard was induced to accept again the secretaryship; the treasurer, William G. Howard of Harvard, was also reëlected. The officers chosen for the ensuing year are: President, Frederick M. Warren, Yale; vice-presidents, John A. Walz, Harvard; Benjamin L. Bowen, Ohio State, and J. Douglas Bruce, Tennessee. For the Central Division Prof. O. F. Emerson, Western Reserve, was elected chairman, and Prof. C. B. Wilson, Iowa, secretary.

The report of the secretary of the general association regarding membership was particularly gratifying. Since 1902, when he first assumed the office, there has been an increase of 50 per cent., a rate which should be continued and even surpassed in the future, for the larger the body becomes the more effective must be its influence. Of the present members, 491 are from the North Atlantic States, 82 from the South, and 305 from various regions of the West. The proportion of articles from different parts of the country appearing in the publications corresponds very closely to the proportions of the membership list.

At the meeting of the Dialect Society Professor Emerson was reëlected president, Professor Mead, secretary, and Professor Fife, treasurer. The treasurer's report showed the society to be in excellent condition, and it was determined to authorize the secretary to renew investigations by means of circulars. It is much to be hoped that this organization will get further support in the prosecution of its work upon dialect peculiarities, which are fading so fast that they must be registered at once or be forever lost. M.

NEWLY DISCOVERED MANUSCRIPTS OF THE BIBLE.

CHICAGO, December 30.

At the meeting of the Archæological Institute of America, Prof. H. A. Sanders of the University of Michigan reported on four manuscripts of the Bible, now in the possession of Charles L. Freer of Detroit. The manuscripts were bought by Mr. Freer early in 1907 in Egypt. They were probably buried or lost at the time of the Moslem conquest in 639 A. D. At any rate the manuscripts all antedate that period, nor, in the opinion of Professor Sanders, do they contain any marks of a second hand even, which can be placed later than this date. Two of the manuscripts are in large uncial hand, two in small, and there are other variations sufficient to convince Professor Sanders that the individual manuscripts were written at different dates, ranging from the third to the sixth century. He refers to the manuscripts by the Roman numerals I., II., III., and IV. Manuscript I. now contains Deuteronomy and Joshua; Genesis to Numbers inclusive, which it once contained, are missing. It is next to the oldest of the four manuscripts, and presents an exceptionally accurate text of this portion of the Septuagint. Manuscript II. contains the Psalms. Although it is the oldest manuscript of the four, and is badly decayed, large portions of every Psalm will prove recoverable. A comparison of a portion of the text shows that it is one of the best manuscripts of the Psalms in existence: in the large portions where the Vaticanus fails, it is perhaps the very best. Manuscript III. contains the four Gospels entire. It was probably written in the fifth or sixth century, and contains many interesting variant readings. It is most important, however, because it contains the following extra paragraph:

> And they answered, saying that this age of unrighteousness and unbelief is under the power of Satan, who does not permit the things which are made impure by the (evil) spirits to comprehend the truth of God (and) his power. For this reason, "Reveal thy righteousness now," they said to Christ, and Christ said to them: "The limit of the years of the power of Satan has been fulfilled, but other terrible things are at hand, and I was delivered unto death on behalf of those who sinned in order that they may return to the truth and sin no more, to the end that they may inherit the spiritual, indestructible glory of righteousness (which) is in heaven."

This new papagraph was known to St. Jerome, and the first few lines of it are cited in Latin translation. It has long been held that Mark xvi., 8-20, was a later addition to the Gospel, thought to have been borrowed from some other unknown Gospel near the end of the second century. This new manuscript probably presents the original form of that part of the lost Gospel, which, mutilated, was added to Mark. The reason for the omission is quite apparent, as the new verse contains the statement that the destruction of sin in the world is near at hand. This idea is found in the epistles of Peter and Paul, but the four Gospels do not have it, and it is avoided by the later church writers.

Manuscript IV. is only a badly decayed fragment. It once contained Acts and the Epistles, but not Revelations. It is an older and better manuscript than the four Gospels, and its readings will be of value to the text wherever they can be deciphered.

THE NOBEL PRIZE-WINNERS.

PARIS, December 14.

The two Frenchmen who have received Nobel prizes this year deserve something more than regulation notes from "Who's Who." And what the French say of the prize for literature awarded to Rudyard Kipling—the first Nobel prize of literature given to any one who writes in English—is also noteworthy. The prize of physics for Professor Michelson of Chicago is so obviously justified by what he has accomplished, that it excites no comment beyond the natural reflection that, as he is a naturalized citizen of the United States, Germany's loss is America's gain.

Dr. Charles Laveran, who receives the prize for medicine, is a product of the old Strasburg faculty, when Alsace was still French. After the war, like many of his fellow-students, he became a French army doctor, and soon was named professor in the Paris military hospital of Val de Grace—a position which he held for twenty years. Perhaps it was the underlying hostility of civilian to military that delayed his election to the Académie de Médecine until the eve of his retirement from teaching in 1893; but the lay Académie des Sciences conferred on him the Bréant prize as early as 1889, and finally elected him to its learned and exclusive body in 1901. He was retired from the army only in 1897, at the age of fifty-two, while still in his prime. He has since worked steadily at the Institut Pasteur, with whose methods he was from the start in full sympathy. His great benefaction to mankind has its origin in such methods; and this is perhaps another reason why the conservative faculty of medicine, notoriously distrustful of Pasteur, who was not even a doctor, so long hesitated to recognize Laveran's discoveries. It was as long ago as 1880 that he read to the Académie de Médecine the first account of what he had been doing in accordance with the new medicine. He had been for two years making researches in the blood of fever and ague patients at the military station of Bône, in Algiers. The low ground of a river delta and more than a thousand years' lack of sanitation had naturally developed malaria, or paludism, to the extreme. Even the Pasteur enthusiasts were at fault; looking for a microbe which always escaped them just as they were finding it. Laveran, who was not a chemist like Pasteur or a civilian professor of orthodox medicine, but just a plain army doctor who had been teaching applied medicine to others like himself for military use, had no theory and used his eyes. In the blood of every one of the victims of malaria he could see black granules, little amœboid spherules, and particularly minute filiform flagella. All this he found whenever he got the blood just as the ague fit declared itself, and before quinine had been administered. He kept on watching these things, which he could see, until he finally made out that they were certainly not vegetable bacteria such as are investigated in culture bouillons. He decided they were animal protozoa, and parasites at that. And so he made the world acquainted with the hidden foe which had so long been troubling myriad human lives—the "hæmatozoa." In 1882 he completed his investigations in Italy, where he came on mosquitoes transporting the malaria which for a thousand years again had depopulated the home of earth's greatest conquering race. Elder physicians and professors still shook their wise old heads. Why, this young army doctor was not even known to them; at most they had seen his name on the title page of a book as having helped one of their number in writing a treatise of pathology. As usual, facts were too strong for theory. Nowadays no physician or scientific man of any authority will deny that Dr. Laveran's discovery justifies the conferring on him of the Nobel prize. In his later years he has found out another microbe, which probably produces that terror of youth—mumps. But his chief present work, long since begun, concerns the "tripanozomes," and the terrible African malady of sleep. The Institut Pasteur continues to furnish him with laboratory and all necessary assistance. The rude soldierly speech in which he indulges on occasion hinders neither students nor rivals from feeling a patriotic pride in this worthy recipient of the Nobel prize.

Two "pacifists" receive the Nobel peace prize. The Frenchman, Louis Renault, a professor of international law, has had a most humdrum life of patient work, recognized by the world's rulers, but hardly heard of by the people whom it has profited. He is now sixty-four years of age; and it is he who has all along been the working member of the delegation of France at the peace conferences of the Hague, and at other congresses where he has engineered the legal battles of the French Ministry of Foreign Affairs. At the Peace Conference of the present year, he was the author of the agreement for an international prize court—about as interesting a result as the long-sitting conference produced. Among his many books, he has written a notable "Introduction to the Study of International Law."

The Italian, who divides the peace prize with him, has, on the contrary, had the most adventurous and picturesque life imaginable. He is ten years older, and began fighting at fifteen, in 1848, against the Austrian rulers of his native city of Milan. It was a fight that failed; but he succeeded in emigrating quickly beyond the frontier and kept on aiming at his ideal by entering the Piedmont military school. He became an Alpine *chasseur* as a soldier, and then, after a dozen years, Garibaldi called for men for his wild Expedition of the Thousand. Moneta was among the first to enlist, and landed on the Sicilian coast with the Liberator, who made him a major. Following his leader, he climbed up and tumbled down the mountain, which the King's soldiers thought impassable, and so left unguarded—and they conquered Palermo. Now for the first time he was given a peace work to do—to pacify the island which he had upset by war and revolution. But he still kept his place in the army and served seven years longer. Then he went in for a new fight, and became editor of that Milan paper which has existed only to combat—the *Secolo*. Here he remained for nearly twenty years. Since then the wisdom of age has taught him that, as for men so for nations, there is a time to fight—when independence is to be won—and a time to speak of peace—when, being independent, they stand up and talk on a footing of equality with others, splitting differences, swapping, and otherwise arranging disputes like good neighbors. This resulted, in 1890, in the foundation of the Lombard Union for Peace, and of a Pacifist organ with contributors among all the leading peace agitators of Europe—*La Vita Internazionale*. Finally, he put all his eloquence and sympathies into a book—"War, Insurrections, and Peace in the Nineteenth Century"—and this has won for him the prize of peace founded by Nobel, who made his fortune in dynamite.

English readers may be surprised to know that most of Rudyard Kipling's books have been translated into French. But no one certainly would ever guess which of them has pleased most French readers and sold the best. It is "The Light That Failed." The "Jungle Books," which were the first to be translated, were too complicated for the French. Melchior de Vogüé, who loves the exotic and introduced Tolstoi to the Western world, says "Kim delighted me"; but every one else tells him it is mortally dull!

S. D.

NEWS FOR BIBLIOPHILES.

The second volume of Konrad Haebler's "Typenrepertorium der Wiegendrucke" (Leipzig and New York: Rudolf Haupt) contains the catalogue of the printers of Italy, the Netherlands, France, Spain, Portugal, and England, completing the surveys of the printing presses of the fifteenth century. The longest list is that under Venice, with no less than 151 names. Paris comes next with 51, while in Germany not one single city could show even half a hundred presses. Germany, on the other hand, had more printers than all other countries, except Italy, taken together, and German names are found under nearly all important cities outside of it. The third volume of the Repertory, which will follow before long, will contain the classification tables for the whole work, repeating those for Germany in the first volume, thus bringing together under one arrangement the descriptions of all the types used by fifteenth century printers.

Among the autographs to be sold by the Anderson Auction Company, on January 10, is a letter of Benedict Arnold, dated "Head Quarters Robinson's House, Sept. 8, 1780. The maker of the auction catalogue imagines that this letter relates to negotiations with Major André, but that notion is exploded by Worthington C. Ford, in a letter printed on page 10 of this issue. The collection includes also letters of some of the rarest signers of the Declaration. The Hancock letter, July 13, 1776, was addressed to Washington. The Abraham Clark document also bears the 1776 date. Among others are fine A. L. S. of Joseph Hewes and William Hooper, both addressed to the Governor of North Carolina; A. L. S. of Thomas Nelson, jr., resigning his office of Governor of Virginia; A.L.S. of Franklin to his wife; letters or documents of James Smith, Matthew Thornton, Samuel Adams, Josiah Bartlett, Thomas Heyward, Francis Lightfoot Lee, and John Penn, as well as a cut signature of Thomas Lynch, jr., the rarest of the series. The Washington material includes an early autograph survey, dated April 4, 1750; an A. L. S. dated 1794; and two L. S., one written from Morristown, February 15, 1780, to Col. Moylan, the other from New Windsor, May 5, 1781, to Gen. James Clinton. The collection is mainly that of Henry Goldsmith, New York.

Correspondence.

VENTURI'S THEORY OF GIOTTO.

TO THE EDITOR OF THE NATION:

SIR: For the intelligent amateur perhaps no more useful modern compendium or guide to the history of that obscure period of Italian art which lies between the seventh and the thirteenth centuries could be found than Professor Venturi's history in its second and third volumes. Both student and teacher must also be grateful for the scope, the ordering, and the judicious perspective of this work in a field where the results of special research are seldom accessible to the general public. It would be worth our while to examine at some length Venturi's general theory and his critical principles as exhibited in his history, but this is not my present purpose. I may say, however, that what may appear as a limitation, or even an error, in the main scheme, the comparative neglect of the extra-Hellenic or extra-Latin elements, the more kinetic factors, let us say, in the equation of mediæval art, in favor of its traditional substratum, its classical survivals and revivals, makes for lucidity and consistency, and was to be expected from an Italian historian of Italian art.

In view of the high value of Venturi's work, a word of criticism as to his treatment of a great problem in Italian painting at the dawn of the Renaissance may interest your readers. Many serious students must have found it strange that Venturi, once embarked upon the perilous ocean of Giotto connoisseurship, should have evolved a theory which is radically at variance with traditional opinion, and which may be fairly characterized by the orthodox as heretical, or even extravagant. In fact, Professor Venturi reveals a certain incapacity for grasping the *rationale* of an expert handling of internal evidence. His arguments are amazingly specious for a scholar of his attainments, and unless sternly disciplined and corrected will, in the later stages of his history, mar an able and fervent book.

Let me take first a specimen of connoisseurship which is easily confuted. Speaking of the allegorical figures of Virtues and Vices at Padua, Venturi cheerfully ascribes to an assistant of Giotto the execution in part of some of these figures—as, for example, the Injustice. This judgment reveals a want of ordinary sense for pictorial unity, which is not only distressing, but contradictory of Venturi's general conception of Giotto's essential characteristics. For even if we—wrongly—look upon the revolutionary, the modern, the realistic, the individual side of Giotto's art as its chief feature, nothing could be more characteristic of the Florentine master than the remarkable presage of modern landscape realism, than the limning—by means of the simplest truth to shadow forms—of full sunlight, air, and distance in a composition of almost plastic severity and reticence. The tyro in criticism must see that no one else before Masaccio could possibly have seen his field with this vivid sense of tonality, and that therefore the ascription of part of the work to an assistant of the master is, to speak plainly, stylistic nonsense rather than just *expertise*. Such a judgment will illustrate Venturi's lack of a sort of connoisseurship which any competent modern painter could, or can, teach him in a half-hour round of gallery demonstration. The beauty and power here—the imaginative forecasting of complex landscape effects—is not dependent upon any technical refinement; it can be seen in an ordinary photographic reproduction.

A more serious error may be instanced—more serious because not dependent upon ignorance of painting *per se*, but as against every canon of historical probability. Venturi in his discussion of the so-called Stefaneschi altarpiece, now in the sacristy of the canons at St. Peter's in Rome, asks us to believe that Giotto, executing part of the work, left the chief panel—the Christ enthroned—to be executed largely by a scholar. Great masters do not divide their labor in this fashion—historically.

The denial to Giotto of the chief initiative exhibited in the Vows of St. Francis and other traditionally accepted works in the north transept of the Lower Church at Assisi, is one of the most startling of Venturi's conclusions. It is very important if true. The argument is detailed and specific, but for those who find Venturi's vital error lying deeper than his analysis of Morellian norms—lying, in fact, in a fundamental misconception of the essential genius of Giotto—it will not carry. I cannot, however, discuss it now, except to say that on the internal evidence alone the authorship of Giotto for the famous works in question—and their assignable date as probably earlier than the series at Padua—depends a good deal, in my opinion, upon our theory of the authenticity and the date of the Stefaneschi altarpiece.

It is with the treatment of the Cycle of the Upper Church at Assisi—the monumental Life of St. Francis—that our quarrel with Venturi's theory becomes acute. One may confess ignorance or even despair before the vast problem of this great series, in relation to earlier Italian art and to the traditional theory of Giotto's direction of or participation in the work—without losing one's right as an inquirer to protest against Venturi's ingenious but certainly fantastic argument in the case. Too much space would be needed to expose the misleading but enthusiastic and sincere plea which Venturi urges for the confident identification of Giotto with (in the prevalent view) an able, a vivid, a dramatic scholar; and to restate the more orthodox position on this matter would be gratuitous. I may be allowed, however, to make one or two observations which I hope will lead the student to the heart of the matter.

In the first place Venturi's argument that all the compositions which are most commonly given to Giotto in the St. Francis Cycle are in some way conventional or derivative, while the real Giottos are fresh and novel, proves entirely too much for the critic's own case. I need hardly hint at the obvious reply. The classic reticence, the conformity, the measure and poise and stylistic conservatism of Giotto are as characteristic as his powerful initiative in composition, his fresh, free attack of every problem in thought or form. The real *crux* of the argument is the character of the compositions which Venturi calls derivative or conventional. Orthodoxy will deny Venturi's absolute and comparative judgment of them and find more originality in their organic modification of pre-existent motives than in the brilliant improvisations of the presumable assistant.

But the issue here is not one of taste alone. An analysis of the earlier compositions of the great Cycle, which will bring out the elements of searching, if tentative, effort in the boldest form-building, a variety and flexibility of design within a self-imposed scheme of the noblest severity and the most lucid unity, is, perhaps, yet to be made. The argument from the research, the growth and modification of compositional, formal, ideological motives within that portion of the famous series which, omitting perhaps the first composition of the series, extends along the north wall of the nave of the Upper Church, is the best refutation of Venturi's doctrine. If most of this work be not what most critics have claimed, the real early Giotto, then it is some other pictorial Hercules. The first composition and the first composition on the south wall—The Death of the Knight of Celano—both of which Venturi considers to be especially characteristic of Giotto, excite the doubts of the present writer. Aubert's view of the problem I have not yet seen. Is there an unknown pre-Giottesque genius—not Cimabue? I shall doubt it.

Let me leave these difficult questions with one specific plea for Giotto's authorship of the Sermon to the Birds. The Entombment at Padua is adorned in its background by one of the most if not the most dramatic yet strictly pictorial treatments of a landscape motive which I know in any occidental art. The immortality of Jesus is symbolized in the fig-tree—just at the point of its budding into spring. No tree in art, not Shakespeare's arboreal image of old age in the sonnet, is nobler than this exuberant fig. That it is Giotto's and not an assistant's is one of the things which we cannot prove—nor care to argue about. Is not the oak of the Sermon to the Birds almost a fellow to it, and what Italian artist, *pace* Leonardo, ever so penetrated into the secrets of arboreal life as did the painter of these and other "conventional" landscape presentations?

WILLIAM RANKIN.

Roselle Park, N. J., December 22.

DECEPTIVE AUCTION CATALOGUES.

TO THE EDITOR OF THE NATION:

SIR: It is astonishing to see what pieces reputable dealers in autographs and manuscripts carry in stock and offer to their customers at prices which are little less than extortionate, pieces of doubtful authenticity or of easily recognized fabrication. But this ignorance is only one side of the question. Another phase, even more reprehensible and inexcusable, is the ignorance of those who prepare auction sales catalogues of such material. The language used in describing individual items has been so stretched and misapplied as to have become unintelligible. Every document is labelled scarce, of great rarity, or unique (as though almost any written paper was not unique!); it is a splendid specimen, in extraordinary condition, of the highest importance, and not to be excelled in any known collection! Superlatives are applied generally, and veriest trash is catalogued as of supreme value. When adjectives fail, a commonplace document is held up to the buyer as "in a particularly choice state, and a fine specimen for framing." History is distorted to bolster a mediocre letter, and every trick is used to confer upon the lot a semblance of importance and value. For this inflation, it is to be feared that the dealers who send a part of their stock to the auction room are in a great measure responsible. Naturally the expert collectors, of whom there are very few, are not usually taken in, though there have been shocking examples of misplaced confidence. Dealers have purchased doubtful manuscripts only to resell them at a higher value, with an assurance of authenticity, an assurance which is not based upon knowledge or research, and is therefore worthless. Both dealers and collectors, by countenancing these methods of cataloguing, are doing much to discredit collecting. The prices paid by rich fledgling collectors are ridiculous in themselves, and offer a temptation to dishonesty and the looting of existing collections.

But a case in point is worth columns of generalities. In a sale to be held January 10 by the Anderson Auction Company, New York, is offered a letter of Benedict Arnold to Nathaniel Stevens, dated September 8, 1780. He states in direct language that he has purchased a cow and a calf from one Bullis, who is temporarily gone to the lines with a flag, and will deliver the animals on the following Monday or Tuesday. Arnold sends the money to Stevens, who is to receive the animals. The letter is reproduced in fac-simile, is an undoubted Arnold letter, but no better than two hundred or more other known letters from the same hand.

Note how the sapient cataloguer treats it. In full capitals he describes it as "a Benedict Arnold letter, relating to André," and continues:

> One of the mysterious epistles connected with the deal to betray the American cause. At the date of the above letter, the plot had been brought to a head and Arnold was trying to arrange a meeting with André. A few days previously, an accident prevented this, and, reading between the lines and comparing the character of the letter with those known to have been sent to Major André, there is no doubt that the epistle now offered was one written in order to bring the business to a conclusion.
>
> It is quite certain that at this critical and anxious period Benedict Arnold was not buying cattle. The letter is printed in full below, and we have italicized those passages which seem significant. We can, by the way, obtain no clue as to the identity of "Nath'l Stevens, Esq."
>
> We have not the slightest doubt this letter was for Major André himself, contained a promise to deliver West Point "on Monday or Tuesday next," and acknowledging receipt of part of the price of Arnold's treason.

The process is simplicity itself. Begin with the date, for *cow* read *André*, and for *calf* read *West Point*, and the thing is done. Now Stevens was nothing more or less than the acting deputy commissary-general of issues at Fishkill at this very time. Bullis had been sent by Arnold to the British lines as escort to Susanna Dean, wife of Nicholas Dean, with her two children, bedding, and wearing apparel—rather a cumbrous outfit for conducting a treasonable correspondence. Mrs. Arnold was to arrive in a few days, and milk and meat were scarce. Another letter from the general to Stevens of a later date gives the result. Stevens obtained a good cow elsewhere, and Arnold felt bound to take that offered by Bullis, giving a detailed description of her, lest another animal should be substituted. In short, there is not one word in either letter that could rightly be twisted into a reference to Arnold's treason, and it is a crying shame to find such stuff seriously written, with the sole object of getting some one to pay a high price. Such cataloguing is an insult to intelligence, a nightmare of history, and a trap for the unwary. *Caveat emptor!*

WORTHINGTON C. FORD.

Washington, December 23.

Notes.

The Macmillan Company announces as forthcoming, "Departmental Teaching in Public Schools," by Van Evrie Kilpatrick, a public school teacher of New York city; and a study of Eastern religion, "The Inward Light," by Fielding Hall, author of "The Soul of a People."

The first two of the twenty-three volumes of the collective edition of Henry James's "Novels and Tales" has been issued by Charles Scribner's Sons. To each volume the author contributes a preface telling the circumstances under which he composed the story, the purpose he had in view, the difficulties under which he labored, and the final result as he now views it after the lapse of many years. These prefaces will form a *biographia literaria* of uncommon interest and significance. They are written, we regret to say, in Mr. James's most exasperating style. The sentences are clogged with qualifying clauses, as if Mr. James's readers had not sufficient intelligence and imagination to perceive qualifications in the very frame of the phrase and connotation of the words, but insisted that it all be put down to the last syllable. The first volume contains "Roderick Hudson," begun in Florence in 1874 as a serial for the *Atlantic Monthly*. The work was continued during a summer partly spent in the Black Forest, an autumn near Boston, and a winter in New York. On rereading "Roderick Hudson," Mr. James confesses, "it stared me in the face that the time-scheme of the story is quite inadequate, and positively to that degree that the fault but just fails to wreck it." "The American," in the second volume, was begun in Paris in the winter of 1875-76. The notion had come to Mr. James while he was riding in a street car:

> I found myself, of a sudden, considering with enthusiasm, as the theme of a "story," the situation, in another country, and an aristocratic society, of some robust but insidiously beguiled and betrayed, some cruelly wronged, compatriot: the point being in especial that he should suffer at the hands of persons pretending to represent the highest possible civilization and to be of an order in every way superior to his own. What would be "do" in that predicament, how would he right himself, or how, failing a remedy, would he conduct himself under his wrong? This would be the question involved, and I remember well how, having entered the horse car without a dream of it, I was presently to leave that vehicle in full possession of my answer.

The publication of both "Roderick Hudson" and "The American" began before the completion of the work; and Mr. James recalls "the frequent hauntings and alarms; . . . the habit of wondering what would happen if anything *should* 'happen,' if one should break one's arm by an accident or make a long illness or suffer, in body, mind, fortune, any other visitation involving a loss of time." And this habit of apprehension bred in due course a confidence that a special Providence "watches over anxious novelists condemned to the economy of serialization."

"The Romance of an Old Time Shipmaster," edited by Ralph D. Paine (The Outing Publishing Co.), contains the letters and journals of an old-fashioned American shipmaster, which for nearly a hundred years were locked in his hattered sea-chest. This mariner was Capt. John Willard Russell of Bristol, R. I., and the picture he gives of life on American ships between 1796 and 1813 is entertaining and valuable. He was several times captured by French privateers, and was chased all one day by a pirate. Tempted by the large pecuniary rewards, he once made a trip to Africa for slaves, but there dire punishment awaited him. He and his crew were stricken with African fever, his ship was captured, and he was imprisoned for seventy days at Goree. No sooner had he sailed thence on a schooner bound for Charleston, laden with slaves, than the ship was boarded by two French privateers, who stripped her of everything movable, except food. These and other occurrences, together with various voyages to the West Indies, are duly set forth, mostly in letters to his wife, phrased in the quaint language of the eighteenth century. They show Capt. Russell as a man of unusual education and capacity for a shipmaster of that period

"Innocent the Great: An Essay on his Life and Times," by C. H. C. Pirie-Gordon (Longmans, Green & Co.), is the kind of book for which there is no excuse except that it is a firstling of the author's pen. Even this fact cannot justify the learned university men who have allowed him to use their names in commending it to the reader. The subject is one of the most grateful that could be chosen by a student of mediæval history. No adequate treatment of the great personality and achievements of Innocent III. exists in English, and the preparatory labors of many careful students have made the present an appropriate time for such an undertaking. Mr. Pirie-Gordon (though, according to the London *Times*, he is not Catholic) writes as if he were a Romanist acutely conscious of the fact, but desirous also not to appear unduly laudatory of Roman institutions. He has obviously read much and learned something of the technical processes of mediæval study; yet he fails through lack of power to present the results of his work in an adequate and convincing way. His book bears the needful imprimatur; he parades the "courtesy of The Eminence of Cardinal Raphael Merry del Val (Cardinal-Presbyter of the Title of Santa Prassede, and Secretary of State to The Holiness of Pope Pius the Tenth)" and others of almost equally magnificent titles, for procuring him the chance to examine two manuscripts in the Vatican library. He makes a display of learning by comparing a few lines of one of these manuscripts with the text of the same in Migne's "Patrologia." He begins every pronoun referring to a pope—he calls them the "pontifical pronouns"—with a capital, a "usage now happily reviving." His style is a singular mixture of tiresome archaisms, strange affectations of phrase, and slangy modern vulgarisms. In his fatal desire to be picturesque he becomes futile. A hopeless style might be excused if the things it was intended to convey were worth the telling; but at no point of his narrative does Mr. Pirie-Gordon rise to the height of even a modest demand for historical soundness. He gives no rational account of his material; he nowhere states his problem intelligently, nor does he succeed in leaving on the mind of the reader any clear impression of the great issues that were being fought out on such a vast scale in Innocent's time. Even the central figure of Innocent himself receives nowhere an even moderately adequate treatment. It would be only too easy to select specimens of the defects which deface every page; but the book is really not worth while.

Not the least deplorable result of modern wars is the herd of books that follow close. So great is their number, and so various their merits, that it is possible to notice only a few. Among those published on the Russo-Japanese war, Filippo Camperio's "Al Campo Russo in Manciuria, note di un marinaio" (Milano: Pubblicazione della "Tecno-Grafica"), is specially worthy of mention. This is no didactic military *biblion a-biblion*, but a living breathing account of what the author himself saw from the Russian side, and in order to see he always got as close to the enemy as the Japanese fire would allow. Greatly aided in his labors by his extraordinary aptitude for languages (not mentioned by the author himself), Camperio rapidly became a favorite not only with the Russians, but also with the Chinese, with whom indeed he could handy jokes in their own speech. He was, therefore, never in the way, consequently had unusual opportunities to see, hear, and learn; and, as a result, has given us a remarkable book. For example, he always had time to see how the Chinese lived. We thus get an unusually clear perception of the Manchurian atmosphere, a valuable by-product. The work is illustrated by over 200 photographs taken by the author, and by twenty-six maps in a folder. We gather from the narrative that Russian valor equalled Japanese, and under better leadership would have had a better fate.

Henry Jephson, author of "The Sanitary Evolution of London" (New York: A. Wessels Co.), was known, before he threw himself so energetically into local government work in London, as an historical student of assured position. Whatever his intention in this present volume, there never was published a book which so completely demolishes the tradition of the benignity and far-seeing wisdom of the governing classes. It is not part of a propaganda for any constitutional reform. Party politics in their national aspects are scarcely mentioned. There is not even a reference to the governing classes. What Mr. Jephson is concerned with is the neglect of local government in London by Parliament between 1835 and 1888, when the London County Council was created, and the toll in suffering and in life which this long neglect exacted. Not all the wars in which England was engaged between the American Revolution and the Boer War were so destructive of life. Year after year Parliament was in session at St. Stephen's, which abuts on the Thames, while hundreds of thousands of the inhabitants of London had no other water to drink than that which was taken from what was then a sewage polluted stream. Within a mile from where Parliament met there were widespread sanitary conditions which would have disgraced a city in Turkey. Neither Government nor Parliament, until half-way through the nineteenth century, pretended to any serious care for London, unless an epidemic of cholera or smallpox was raging or threatening. Moreover powerful vested interests in disease and dirt long stood in the way of sanitary reform. Thus it was not until 1888 that London had a popularly-elected council responsible for its larger affairs; and the new century had opened before London had municipal institutions as efficient as those of such cities as Manchester, Birmingham, Liverpool, and Leeds. Mr. Jephson recounts the history of the sanitary evolution with the calmness of a scholar. There is a period in the history of the English poor law known as the pig-stye era. Mr. Jephson's book might not inappropriately be entitled the history of the pig-stye era of London municipal government.

A recent number of the Publications of the Modern Language Association of America contains an interesting paper, by William Guild Howard of Harvard, on "Burke among the Forerunners of Lessing." Although Lessing does not mention Burke in his "Laokoön," he, as well as Mendelssohn and Herder, paid a good deal of attention to Burke's æsthetic speculations, and even Kant and Schiller did not escape their influence. Lessing, while writing to Mendelssohn about Burke's "easy philosophy," recommended his treatise as an "exceedingly useful collection of material for a good system, which no one could put to better use than you yourself." Burke and Lessing, as Mr. Howard points out, were at one as regards the notion that poetry is not a so-called "word-painting," but they differed concerning the symbols of poetic expression. There are many interesting quotations given, from both Burke and Lessing, to show their points of difference, as well as of agreement. Perhaps a direct evidence of the influence of Burke on Lessing might have been found in the connection between Lessing's famous dictum: "Raphael would have been the great painter he was even if he had been born without arms," and Burke's description of a poet, "blind from birth, who nevertheless could describe visible objects with a spirit and justness excelled by few men blessed with sight."

The triple number 4-6 of the Bulletin de l'Institut International de Bibliographie for 1906 (Brussels) has recently made its appearance, consisting of a list of bibliographies published in 1904, with not a few (160 out of a total of 729) from earlier years, as far back as 1897. The corresponding parts of Professor Hortzschansky's Bibliographie des Bibliotheks- und Buchwesens for 1904, issued in 1905, and covering the end of 1903 as well as the greatest part of 1904, contained 426 titles. In comparing these figures, however, it should be borne in mind that the Belgian list repeats titles of publications dealing with more than one subject. Absolute completeness, in bibliographical works, is, of course, difficult, if not impossible to obtain, but why a list published in 1907 does not contain all the titles in a list covering the same ground and issued two years earlier, is difficult to explain on any other ground than carelessness. The most glaring omission is that of the various national, German, Polish, etc., issues of the International Catalogue of Scientific Literature.

The Clarendon Press, Oxford (New York: Henry Frowde) has issued in a revised form Volume II. of Henry Furneaux's invaluable edition of the "Annals" of Tacitus. The historical notes and introduction were revised by the late Prof. H. F. Pelham, while C. D. Fisher conformed the text to that which he established for his recent edition of the "Annals" in the Oxford Classical Series. As a result of this twofold revision, Furneaux's work has been corrected and supplemented in important details, and has somewhat decreased in bulk.

Besides Mr. Fisher's edition of the "Annals," the Oxford Classical Series has recently included the minor poems ascribed to Virgil ("Appendix Vergiliana"), edited by Prof. Robinson Ellis of Oxford. This edition is an exception to the general plan of the series, which undertakes to present in a critical apparatus only the most important variant readings or emendations. We are not sorry, however, in view of the corruptions to which the text of the "Appendix Vergiliana" has been exposed, that Professor Ellis has constructed an elaborate critical commentary, with which every subsequent editor must reckon.

From the University Press of Cambridge (New York: G. P. Putnam's Sons) as No. XIV. of the Cambridge Historical Essays, comes a scholarly and well-written "Life of Alexander Serverus," by R. V. Nind Hopkins. The emperor's names, which are only two of many, should read Severus Alexander, but the author adheres sensibly to the traditional order. He is well read in the literature of his subject, and has made commendable use of the Latin inscriptions of the period, which, owing to the paucity of literary information on the career of the emperor, deserve special attention from the historian.

Prof. C. H. Grandgent's "Introduction to Vulgar Latin" (Boston: Heath & Co.) will be welcomed as an indispensable help by students in more than one department of learning. The main headings under which the subject is treated are Vocabulary, Syntax (wisely considered, in this case, out of the order usual in grammars), Phonology, Morphology. The author has brought together a large amount of information from widely separated sources, has correlated it skilfully, and provided references at every turn, thus facilitating further investigation of any usage or form. Such a method is most desirable in view of the material still unexamined. The book has a general bibliography and a serviceable index.

Whatever may be one's individual opinion about the essential value of Nietzsche's philosophy, one could not but deplore the interruption to the publication of his works in English, and cannot but rejoice that the series of volumes is now recontinued. The new issue put out by the Macmillan Company (apparently with Dr. Oscar Levy as its "angel") is "Beyond Good and Evil, Prelude to a Philosophy of the Future," translated by Helen Zimmern. This is Volume IX. of Nietzsche's works, although the fifth to be published, following the "Zarathustra" and to a certain extent elucidating the difficulties of that rhapsody. Miss Zimmern was personally acquainted with Nietzsche, and he looked to her to translate his books; she has in the present volume turned his German into fluent and easy English.

Prof. William James's "Varieties of Religious Experience" has been translated into German by Dr. Georg Wobbermin, formerly privat-docent at Berlin and now professor of theology at Breslau. The German title is "Die Religiöse Erfahrung in ihrer Mannigfaltigkeit" (Leipzig: J. C. Hinrichs).

The future of the Papacy is in some respects the burning question of the day in Catholic lands. Professor Baldassarre Labanca of the Roman University has published under the title "Die Zukunft des Papsttums" (Tübingen: J. B. C. Mohr), a strictly objective work, which puts the matter clearly. The writer first surveys the history of the Papacy and shows, among other things, that the designation "Pope" in early times was not the exclusive privilege of Roman bishops, but meant merely spiritual father. When the Church received from Pepin and Charlemagne the lien that came to be known as the Patrimony of St. Peter, the Pope, according to Labanca, only administered these lands as the vassal of the Emperors. Constantine's famous Donation, to which even Dante refers, is now proved to have been a clerical invention. As Labanca says, Constantine must have been mad if he had thus of his own free will created a state within his own state; it was the disturbed condition of society that permitted the Church to become an Anti-State. What is now demanded by modern society, in the view of Professor Labanca, is that the Church should once more become a juridic institution and should not seek to exert political functions. This is what is meant by the modern demands for the separation of Church and state; and Labanca is convinced that the longer the political pretensions of the Papacy last, the shorter will be its religious power. Indeed Labanca is not at all sure that this is not already doomed, because the people of to-day will not be long willing to take orders from any person, no matter who or what his claims, whose call upon them does not correspond to their national characteristics and traditions. He thinks every nation will make for itself a form of Christianity that best suits its needs.

In the investigation of the intricate Synoptic problem, which seeks to analyze the first three gospels into their original sources, and to adjust these properly as the basis of the story of Jesus and his work, a number of new books indicate a change of base from Mark, to a greater emphasis on Luke. Two or three years ago, Wellhausen, in his *Einleitung* to the first three gospels, gave to Luke an importance altogether unusual. Still more recently came Harnack's volume, "Lukas der Arzt"; and this has lately been followed by another work, largely on Luke, by the same author, "Sprüche und Reden Jesu, die zweide Quelle des Matthäus und Lukas." In this book he assigns to Luke in many particulars a prominence in the gospel story above that given to Matthew. And now Prof. B. Weiss, the tireless octogenarian of the University of Berlin, has just published an investigation along this same line, "Die Quellen des Lukasevangeliums" (Stuttgart und Berlin: J. G. Cotta). In detail he discusses the relation of Luke to Mark, of Luke to the Matthew source, the source of Luke, and the composition of the gospel of Luke. The general tendency is to emphasize Luke as a reliable source for the story of Jesus and His gospel.

Adolf Risch has just issued a book entitled "Die deutsche Bibel in ihrer geschichtlichen Entwicklung," constituting two *Hefte* in the series known as Biblische Zeit und Streitfragen, edited by Prof. F. Kropatscheck, and published by Runge of Berlin. This work traces the influence which Luther exercised on modern thought in the single capacity of a Bible translator, and in this particular makes out a good case for the reformer.

The ninth volume of the Semitic Study Series, entitled by Profs. R. J. H. Gottheil of Columbia and Morris Jastrow, jr., of the University of Pennsylvania (Leyden: Late E. J. Brill), is "Selected Babylonian Business and Legal Documents of the Hammurabi Period," by Arthur Ungnad, of the Royal Museum at Berlin. This issue is intended as a handbook to introduce the student to the study of these documents, dating from the close of the third and the beginning of the second pre-Christian millennium. The editors announce that three other parts of this Babylonian handbook series will soon appear; one covering the documents of the period of Sargon and Ur-Gur, *i. e.*, the first part of the third millennium; one the neo-Babylonian; and one the Persian period, the two latter including between them a considerable part of the first millennium. These parts are to be by Messrs. Lau, Ungnad, and A. T. Clay, respectively. This leaves untouched the Cassite period, the middle of the second millennium, for which no definite arrangements are yet made. The present volume contains only about sixty pages, giving the cuneiform text of forty-three documents, a list of the 202 signs used in those documents, glossaries of Semitic and Sumerian words, and a list of proper names arranged alphabetically. The introduction includes a brief account of the discovery of the documents and of the literature dealing with them.

One of the most considerable of the Moslem travellers to whom we owe so much information concerning the social and political condition of Western Asia and Northern Africa is the Spanish pilgrim and poet, Ibn Jubair (1145-1217). His *Rihla* ("Travels") was edited by William Wright in 1852 from a single manuscript in the university library of Leyden. The trustees of the Gibb Memorial have now issued a second edition revised by De Goeje (Leyden: E. J. Brill; London: Luzac & Co.). Wright's reading of the manuscript, says De Goeje, was most careful and accurate, so that there was little to change in it; Fleischer declared that Wright had done the work better than many a professor of long standing could have done it. When the edition was first prepared only one manuscript of the Travels was known; since that time it has been reported that another manuscript exists in the library of the principal mosque at Fez, but, so far as appears, this has never been examined by any Western scholar. In the correction of the text Wright made use of whatever quotations he could find in the works of other authors, as Ibn Batutah, Ibn al-Khatib, al-Maqrizi, al-Maqqari, and especially al-Sharishi, the pupil of Ibn Jubair. He has added an index of proper names, and a short glossary containing the explanation of a few architectural and nautical terms, for which he refers also to Dozy and to Jal's "Glossaire Nautique."

M. C. Jacottet of the Paris Evangelical Mission, with the financial support of the London publication house of Kegan Paul, Trench, Trübner & Co., has undertaken the systematic investigation of the languages of South Africa. A beginning is to be made with the Basuto, and the researches are to be historical, linguistic, and literary.

The interesting and important discoveries of Aramaic Papyri at Elephantine, an island in the upper Nile, discoveries discussed at some length in the *Nation* of November 14, 1907, p. 440, are published in facsmile and translation, with explanation and commentary by Prof. Eduard Sachau (Berlin: G. Reimer).

Prof. Dietrich Schaefer, of the University of Berlin, has just published, through E. S. Mittler, Berlin, a "Weltgeschichte der Neuzeit," in two volumes, covering the development of modern culture in its important aspects from the Reformation to the present day.

Library progress in New Jersey during the year ending October last is thus summarized in a recent report by the State Library organizer: The travelling library system was enlarged by the addition of 3,000 new volumes, and 603 travelling libraries were circulated; 18 new libraries were established; 47 were aided by the Commission in improving their methods of work; 107 were aided along other lines. There are still 27 towns in the State without libraries.

The following items are taken from the annual report of the New York State Education Department on Public Libraries, to be submitted to the Legislature this month. The report is based on statistics received from 1,282 libraries, of which 661 are free lending libraries. These report a total of 3,782,600 volumes in stock, and a circulation for the past year of 14,968,722 volumes, an increase over the preceding year of 136,947 volumes in stock, and of 1,135,083 volumes circulated. The average free circulation of books for each 1,000 of the population of the State is 1,855 volumes. Beginning in 1893, with an average of 352 volumes to each 1,000 persons, this item has steadily advanced year by year without one backward step, as shown by the following table:

FREE LENDING LIBRARIES, 1893-1907.

	Libraries		Circulation.	
Year.	No.	Volumes.	Total.	Per 1,000 pop'l'n.
1893....	238	849,995	2,293,861	352
1894....	293	1,049,869	2,766,973	425
1895....	309	1,127,199	3.146,405	483
1896....	351	1,313,299	3,933,623	604
1897....	375	1,446,874	4,904,793	753
1898....	408	1,755.036	6,439,999	989
1899....	431	1,979.319	7.395.527	1,135
1900....	460	2,187,125	8.452,445	1.163
1901....	529	2,425,260	9,232,697	1,270
1902....	550	2,598,472	10.063.703	1.385
1903....	555	2.804.628	10.897,126	1,500
1904....	573	3.108,365	11.347,802	1,561
1905....	655	3,437,876	12.086,816	1.663
1906....	678	3,645,662	13.835,639	1,715
1907....	661	3,782,609	14,968,722	1,855

"The steady advance thus recorded," says the report, "in which the issue of books, from free libraries has increased from 2,293,861 to nearly 15,000,000 volumes, is a striking demonstration of the growing significance of the public library in the economy of the State, and emphasizes the importance of giving it right direction in all its departments." Of the forty-six cities, seven paid nothing last year from taxation for public libraries; four others paid less than $500. The total amount, however, provided by tax in the cities of the State for libraries was $1,102,095, an increase of $77,000 over the year before. Sixteen new library buildings were completed and occupied within the year covered by the report. Seven of these were erected in the several boroughs of this city from the Carnegie fund. In the travelling library system there are now 82,880 volumes, the largest collection of its kind in the world. The total number of libraries sent out during the year was 779, containing 40,377 volumes. More than half of these libraries were sent to registered study clubs, the remainder being sent to groups of citizens in places having no public library, to public libraries wishing to supplement their scanty supply, to public schools, to charitable institutions, to individual families, and to various organizations, such as granges, Young Men's Christian Association, etc.

W. F. Yust, librarian of the Louisville Public Library, reports the following facts regarding library conditions in Kentucky: According to best obtainable statistics there are now in the State seventy-nine libraries of from 1,000 to 10,000 volumes, six of from 10,000 to 20,000, three of from 20,000 to 30,000, one of 50,000, one of 90,000, and one of 100,000. Of the ninety libraries thus enumerated, twenty-one are free public libraries; the others are institutional or subscription libraries. Ten of the public libraries, or almost one-half the total number, have Carnegie buildings. By far the larger part of the free library work of the State is being done in Louisville, where five Carnegie buildings are now being erected, and where last year the appropriation of funds and the circulation of books were probably twice as large as in all the rest of the State. Of the 119 counties there are but sixteen with free libraries and twelve with subscription libraries. The other seventy-one are without libraries altogether. The travelling library system is maintained by a committee of the Women's Federation of Kentucky, containing eighty-four libraries of fifty-five volumes each which are circulated in twenty-four mountain counties.

Joel Chandler Bancroft Davis died December 27 in Washington. He was born in Worcester, Mass., in 1822, a nephew of George Bancroft. After graduation from Harvard in 1840, he practised law, and afterward entered the diplomatic service. In 1869 he was appointed Assistant Secretary of State, and in 1871 he prepared the Case of the United States for the arbitration of the Alabama claims at Geneva. For nineteen years preceding his resignation some five years ago, he was reporter of the United States Supreme Court. In his early days he had been editor of *Massachusetts Justice*. Besides editing the reports of the Supreme Court, he had prepared a volume, "Treaties and Conventions entered into by the United States." He was author of two pamphlets: "The Origin of the Book of Common Prayer," and "The Place and Work of the Laity in the Church."

Andrew Jackson George, head of the department of English in the Newton (Mass.) high school, died December 27. He was born in Goffstown, N. H., in 1855 and was graduated from Amherst in 1876. He had edited some twenty volumes of English classics for school use.

Jean Joseph Cornély, a French journalist, connected at one time or another with the *Journal Officiel, Estaffette, Figaro, Gaulois,* and *Matin*, died December 26. He was born at Nogna in 1845. Among his books are "L'Œil du diable," a romance of adventure; "Le Czar Alexandre III et le Roi (Le Comte de Chambord)," recollections and impressions of travel; "La France et son armée"; "Rome et le jubilé de Léon XIII, notes d'un pélerin."

THE LIFE OF A BUCCANEER.

Dampier's Voyages: Consisting of a New Voyage Round the World, a Supplement to the Voyage Round the World, Two Voyages to Campeachy, a Discourse of Winds, a Voyage to New Holland, and a Vindication, in Answer to the Chimerical Relation of William Funnell. By Capt. William Dampier; edited by John Masefield. 2 vols. New York: E. P. Dutton & Co. $7.50 net.

John Masefield, whose "On the Spanish Main" was reviewed in the *Nation* of October 11, 1906, has done a good piece of work in preparing this edition of Dampier's writings. From Dampier he drew not a little of the material for the book we have just mentioned—an account of the buccaneers and of the English forays on the Isthmus of Darien; and now he has given us the originals in two excellently printed and sufficiently annotated volumes.

"I would ask those readers who find the voyages dull to remember the life of him who wrote them," says Mr. Masefield in an introductory memoir. But the voyages are not dull to one who has acquired the art of skipping. There are many details about winds and currents and shoals, transcripts from a sailor's log, but all these and other technicalities can be passed over at a glance by the reader who is intent upon the real stuff of Dampier's narratives: his observations upon plants and animals, upon the strange manners and customs of the far-away lands he visited, and, above all, his picture—not formally drawn, but built up by little touches here and there—of life among the buccaneers. For Dampier was himself an interesting man. The "Dictionary of National Biography" puts him down as "buccaneer, pirate, circumnavigator, captain in the navy, and hydrographer." Such a person is worth knowing.

The facts regarding his life are drawn mainly from his own writings. The son of an English tenant-farmer, he was born in 1652. At the age of sixteen he went on a voyage to Newfoundland, and was disgusted by the hardships. But in three or four years he was on shipboard again, and he followed the sea almost till his death in 1715. He was in the fleet that fought the Dutch, in 1673; he sailed for the Bay of Campeachy to secure a cargo of logwood in 1675, and for two or three years he alternated between log-cutting and buccaneering. In 1679 he put forth again for the West Indies, crossed the Isthmus, sacked Santa Marta, seized several Spanish vessels, and, plundering and burning, got as far south as the island of Juan Fernandez. After many privations, he made his way back to Virginia in 1682. A year later he set out from there with a party that doubled Cape Horn, ravaged the west coast of South America, and finally started across the Pacific. They visited the Ladrones, the Philippines, the Chinese coast, and New Holland. Dampier and several companions were marooned on Nicobar Island; but, relying on Dampier's skill as a navigator, they boldly ventured in a canoe and made their way to Sumatra. He was desperately ill, but after recovery he spent two years in trading voyages to Tonquin, Madras, and other places. Then he managed to get passage on an Indiaman and reached England in 1691, after an absence of twelve years. Of his life during the next six or seven years we have no account; but early in 1699, under authorization of the Admiralty, he commanded an exploring voyage in the region of New Guinea; in 1703 he made another expedition to the south seas. The history of these efforts is a history of discontent, quarrels, and mutiny, and at least one wreck. On his last voyage he was pilot on the Duke, a privateer, commanded by Captain Woodes Rogers. The Duke, with the Duchess as consort, sailed from England in 1708, passed round Cape Horn into the Pacific, rescued Alexander Selkirk—the supposed prototype of Robinson Crusoe—from his solitary imprisonment on Juan Fernandez, crossed the Pacific, and came home by the Cape of Good Hope.

Through this crowded and active career, through all privations and perils, he doggedly kept a journal which he worked over into the volumes enumerated in the title. The "New Voyage" was published in 1697, and his last work, the "Vindication," in 1707. How he found time, energy, or inclination, surrounded as he was by pirates, logwood-cutters, and carousing and ignorant sailors, to note with such care the appearance and habits of every plant, fish, bird, or beast that he saw, and to chronicle the traits of the painted savages and the yet more savage Englishmen of his crews—this is the mystery. Yet his "Discourse on the Wind" may, according to the "Dictionary of National Biography," be "even now justly regarded, so far as it goes, as a textbook of that branch of physical geography." Moreover, Humboldt declares that such distinguished savants as Condamine, Juan, and Ulloa added little to Dampier's observations on the objects that fell under his eyes. His pages do not lend themselves readily to brief quotation, but here is a sample, an account of the almost human intelligence and ethical code of the man-of-war birds and the boobies on islands off the coast of Yucatan:

> If one of these lame [man-of-war] Birds found a young Booby not guarded, it presently gave him a good Poult on the Back with his Bill to make him disgorge, which they will do with one Stroak, and it may be cast up a Fish or two as big as a Man's Wrist; this they swallow in a Trice, and march off, and look out for another Prize. The sound Men-of-War will sometimes serve the old Boobies so at Sea. I have seen a Man-of-War fly directly at a Booby, and give it one blow, which has caused it to cast up a large Fish, and the Man-of-War flying directly down after it, has taken it in the Air, before it reach'd the Water. (Vol. II., p. 129.)

Readers who have not the taste of a naturalist, but who think that the proper study of mankind is man, will find scattered here and there much about wild peoples and their ways; for Dampier had an insatiate curiosity. He informs us, in his "Supplement to the Voyage Round the World," that whenever he reached a new settlement, "usually after Supper, if the Day was not shut in, I took a ramble about the Village, to see what was worth taking notice of, especially the Pagoda of the place." He jots down the looks of the people, their dress, food, social customs, the relations of the sexes, the methods of government, and the worship. If we may believe him, the administration of anæsthetics in surgery was practised in China at least as early as the year 1688:

> 'Tis reported, that they first put the Patient into a Sleep: But how long they are curing him after the Operation is over, I know not. (Vol. II., p. 15.)

But, as we have said, the significant thing is not so much what he offers us directly, as the reflection in his writings of the desperate trade of the buccaneer and pirate. "What a set! What a world!" was Matthew Arnold's exclamation on reading Dowden's "Life of Shelley." Arnold would have found the set of gentleman adventurers to which Captain Dampier introduces us even less attractive. They were a crew of drunken cutthroats, brawling, fighting, and murdering. Dampier passes very lightly over their exploits in capturing Spanish ships and robbing and destroying villages; but their mutinies and their squabbles over booty tell the tale in unmistakable terms. And then their sufferings from scurvy and from tropical fevers, their wounds, their bad food, the drinking water, which "looked more like ink than water," their hunger and thirst, the storms at sea, the impenetrable thickets of the tropical forests through which they hacked their way—all these make one marvel what a man could find in a life so destitute of all that seems to us worth while. The buccaneers could not enjoy even the coarsest gratifications of the senses. For some of them the prize was indubitably the heaps of gold for which they staked their bodies and souls. Yet they seem to have had no clearly formulated plan for doing anything with the treasure when once they got it. They were apparently actuated by sheer blind, brutal lust of possession.

But with some of them—with Captain Dampier himself, we believe—the impelling motive was something nobler than the mere greed of the miser; it was the love of adventure and romance. The wonders of the universe were unrolling before their gaze; lands of almost fathomless mystery stretched before them; their ears were filled with the call of the wild; and battle and tempest and hair-breadth escape set their hearts flying. Their gusto for changes and for hazards is that which Kipling celebrates in his "Sestina of the Tramp-Royal" and again in his "For to Admire"—

For such as cannot use one bed too long,
But must get 'ence the same as I 'ave done,
An' go observin' matters till they die.

What do it matter where or 'ow we die,
So long as we've our 'ealth to watch it all—
The different ways that different things are done.

Dampier had his moments of repentance. "A sudden skirmish or engagement, or so, was nothing when one's Blood was up, and pushed forwards with eager expectations"; but "a lingring view of approaching Death" sapped his courage:

> I made very sad Reflections in my Former Life, and look'd back with Horror and Detestation on Actions which before I disliked, but now I trembled at the remembrance of. I had long before this repented me of that roving course of Life, but never with such concern as now. (Vol. I, p. 482.)

But the danger passed, he fell back into his old view of life:

For to admire an' for to see,
For to be'old this world so wide—
It never done no good to me,
But I can't drop it if I tried!

CURRENT FICTION.

The Altar Fire. By A. C. Benson. New York: G. P. Putnam's Sons.

Mr. Benson grows not a whit less ingenious or more conclusive as time passes. His power of production seems to have no limit. To bring out as many as four or five books a year has been scarcely possible hitherto even for a novelist. The putting forth in so brief a time of several volumes of intimate essays dealing with the more subtle and difficult problems of human experience is nothing short of a prodigy. The mere fact of it reduces one to the Johnsonian attitude of wonder at the achievement itself and not at its quality. In a sense, no doubt, the author would be justified in thinking that the author's pace is none of the reader's business. So be it. The fact remains that Mr. Benson's half-dozen books of confession (whether personal or dramatic) give one a sense of continued effusion, rather than of steady growth or even accumulation. They are ingenuous, sympathetic, graceful, moving—what you will; only they do not seem to "get anywhere." Such literature, when it impinges on the graver sphere of human experience, is not without its dangers. It is in the way of stimulating the spiritual sense for a moment, only to leave it, so to speak, with the pores open.

"The Altar Fire" is more nearly akin to "The Gate of Death" than to any other of its predecessors. Its theme and mood are similar. In the later study, however, the problem is more complicated. The diarist in "The Gate of Death" survives, as it were, his physical self, and records the data of his strange experience. The diarist of "The Altar Fire" survives his creative self, his ambition, and his family. In itself the record of his transition from the artist's absorption to a contented domesticity, and from that to a condition of spiritual well-being altogether independent of toward or untoward circumstance, is interesting and even edifying. The protagonist is initially well favored rather than strong. Ample means, a happy marriage, and an early literary success have brought him well toward middle life without subjecting him to the storm and stress from which character springs. The suddenly realized exhaustion of his literary impulse brings home to him with a first shock the fact of his essential limitation. The groanings of spirit which follow remind one of Tennyson's "Supposed Confessions of a Second-rate Sensitive Mind not at one with itself." All the conditions of his life are fair; only he himself is worth nothing. But gradually the desire to write leaves him, and at last even the regret of that desire. He finds it possible to busy himself contentedly with the humble affairs of daily life, his estate, his neighbors, the education of his children. Then his family are taken from him, one by one: his son, his wife, and his daughter. The numb despair which follows is gradually displaced by faith, and by the resolve to hear a part honestly and humbly in the work of the world. Certainly this is a credible, even a common, experience. That it is not altogether a healthy one, Mr. Benson freely admits:

> No doubt the subject is a morbid one, because the book deliberately gives a picture of a diseased spirit. But a pathological treatise, dealing with cancer or paralysis, is not necessarily morbid, though it may be studied in a morbid mood. . . . Morbidity only begins when one acquiesces in suffering as being incurable and inevitable; and the motive of this book is to show that it is at once curative and curable, a very tender part of a wholly loving and lovable Fatherly design.

Ah, one reflects, but is such truth to be best shown by such means? It is the hysterical self-consciousness of this sufferer, the insatiable self-pity, which must repel robust minds. Even at the end, in his resignation, his piety, his aspiration, there is more than a trace of the flattering unction which is the unfailing solace of an infertile egoism. Is it unfair to hint that to protest too much is the perilous tendency, not only of Mr. Benson's interlocutors, but of Mr. Benson himself?

Jesse ben David, A Shepherd of Bethlehem. By James M. Ludlow. New York: Fleming H. Revell Co.

Of the many literary crimes that are yearly committed in the name of Christmas, none, surely, is more deplorable than the inveterate production of a certain number of stories in which stars, camels, sheep, and Roman chariots figure conspicuously among the properties. A curious pseudo-Biblical vocabulary is one hallmark of the *genre*. And for plot, the procedure is to weave certain strands of the sacred story, more or less re-colored to suit modern taste, into the fabric of some trite melodrama. Listen to the latest rendering of the shepherds' message:

> "Peace, friends! peace!" cried Jesse. "Let Joshua speak, or Boaz," addressing the foremost of the herdsmen.
>
> "We know not how to tell it," said Boaz, his excitement confusing his words. . . . "Suddenly the sky burst with light. . . . Then there sounded a mighty voice as of the angel of the Lord. The heavens shook and the stars were jarred out of their places with the noise, as are the figures wrought into a tent when a great wind falls upon it. Yet was that voice softer than the chords of the harp—and this it said, 'There is born to you this night in the city of David a Saviour, which is Christ the Lord.' . . . And suddenly there was with the angel a multitude of the heavenly host. Each star bore the face of an angel, and the fleecy clouds were changed to wings. Then the angel-faced stars sang together. . . ."

Here is imagination! How barren, how meagre, appears the traditional narrative of the shepherds watching their flocks by night, beside the new and improved version, in which angel-faced stars ingeniously play their rôle. It remains to provide the text with "lavish" marginal decorations, representing tables of the law, doves, harps, helmets, and what not; to insert a number of primitive-looking woodcuts and a colored plate of the Nativity; lastly, to bind the volume in cream, blue, and gold—there you have a perfect gift-book and an ornament to any marble-topped parlor table.

The Heart of Jessie Laurie. By Amelia E. Barr. New York: Dodd, Mead & Co.

First may we call attention to the absurd character of the head by Harrison Fisher which decorates the cover and fronts the title-page of this book? It seems to us that the so-called illustrator waxes in pure impudence day by day. The mere writer is more and more helpless in his hands. Vain are the stipulations of the text, vain the carefully expressed opinion of the author that his people have a certain appearance, or do certain things. This lady may be recognized as a Fisher girl, but she is not the fisher lass of Mrs. Barr's story; in place of the "gayly striped fisher gown and bright blue kerchief" with which the author feebly accredits her, the artist has thoughtfully provided a modish "shirtwaist" and stock. The young person on this cover may be a local concession.

In itself, this is a good story by an experienced story-teller. Its atmosphere is that in which Mrs. Barr breathes most easily. Jessie Laurie is an Effie Deans of a sturdier mould. She abandons a lover of her own class in response to the call of an aristocratic young Lothario. He gains possession of her by a form of marriage which he intends to be a mockery, but which turns out to be legal, so that technically she is not betrayed. The child of the union becomes the scapegrace's heir, and the scapegrace, taking himself off by drowning, leaves her free to marry the faithful and magnanimous lover. If the sum of all this is not a story of remarkable power, it is certainly a story told with more than ordinary intelligence and control. The character of Jessie herself, at first emotional, selfish, and headstrong, is shown to be developed, not violently converted, by suffering, into a strong, loving, by no means mawkishly repentant, womanhood. So long as fiction is recognized as something more than a trick to amuse, novels like this will continue to be accepted with respect, if not precisely with awe.

The Affair at Pine Court. By Nelson Rust Gilbert. Philadelphia: J. B. Lippincott Co.

"In the Adirondacks, in this year of our Lord, it is incredible." So one of the characters describes the doings at Pine Court, and we are inclined to agree with him; but if the writer has strained for the unusual in somewhat too obvious a fashion, at least he has avoided the Scylla of the stereotyped. Chenberger-Vogel, the pivotal personage, is only an impossible cad instead of a potential Satan, and his tirades grow tiresome at times; but on the whole the book is entertaining, especially in the bits of naïve moralizing on every subject from the cleanliness of the poor to Christian Science, that cling like mistletoe to the trunk of the story, and appeal potently, if unconsciously, to the reader's sense of humor.

The Interrupted Honeymoon. Jane Grosvenor Cooke. New York: A. S. Barnes & Co.

This story begins pleasantly—so pleasantly that for the sake of the beginning one wades in exasperation through sloughs of despond, doggedly determined to unearth the reason why Sarah left William on their wedding journey. The behavior of this misguided pair is a fine example of the good old New England trait of "cussedness": and the convalescence of their happiness is attended by an exhausting number of relapses. "The Interrupted Honeymoon" would have made an excellent short story of the kind made famous by Mary Wilkins, but in its present state, it recalls the comment of the bored guest in "Trelawney"—"Sit down; you finished long ago."

Reconstruction, Political and Economic, 1865-1877. [The American Nation, Vol. XXII.] By William A. Dunning. New York: Harper & Bros. $2 net.

Two points only in this volume seem to call for comment. The first, always especially significant in a work which, like this, deals with a transition period, is the point of view. Professor Dunning states his position clearly in the following sentences from his preface:

> We must regard the period [of reconstruction] as a step in the progress of the American nation. In this aspect the North claims our principal attention. The social, economic, and political forces that wrought positively for progress are to be found in the record, not of the vanquished, but of the victorious section. In this record there is less that is spectacular, less that is pathetic, and more that seems inexcusably sordid than in the record of the South; but moral and dramatic values must not have greater weight in the writing than they have had in the making of history.

How well the author has adhered to his purpose, even a cursory examination of his book would suffice to show. Throughout, accounts of purely political matters directly affecting the South are rigidly condensed, while discussions of constitutional questions are reduced to their lowest terms. Professor Dunning has not, to be sure, lost sight of the fact that the greatest question before the nation, in the twelve years whose story he tells, was the rehabilitation of the South; but he has succeeded in pointing out, better than any other summary writer on the period, the wide variety of other interests with which the people were at the same time concerned. Thus, we have brief and incidental, but relatively fitting, discussions of the tariff, currency, public lands, and the settlement of the West, railroad extension and consolidation, and the general course of trade and commerce; together with such special topics as the Whiskey and Tweed rings, the Crédit Mobilier, the Belknap and other investigations, civil service and spoils, the panic of 1873, the granger movement, and the recurring Indian outbreaks. Similar in treatment are the accounts of foreign relations, including such important matters as the Fenian raid, the Alaska purchase, the negotiations regarding San Domingo and the Danish West Indies, Maximilian and the French in Mexico, the "Virginius" affair, the Alabama claims and the treaty of Washington, and the fisheries arbitration.

The other point is the author's judgments of men. Towards the Republican policy as a whole, Professor Dunning's attitude is prevailingly critical, though he does not fail to diagnose the political situation with detailed care, or to give due weight to the enormous difficulties which the problem of reconstruction presented. On the whole, his sympathies seem to lie in this respect with the Liberal Republicans. In his estimates of Republican leaders, however, his criticism is caustic. Thaddeus Stevens, for example, appears in the Congress of 1866-67 "truculent, vindictive, and cynical," his "keen and relentlessly logical mind" and "ever-ready gift of biting sarcasm and stinging repartee" balanced by "a total lack of scruple as to means in the pursuit of a legislative end." Sumner's forte was "exalted moral fervor and humanitarian idealism":

> He lived in the empyrean, and descended thence upon his colleagues with dogmas which he discovered there. . . . He would shed tears at the bare thought of refusing to freedmen rights of which they had no comprehension, but would filibuster to the end of the session to prevent the restoration to the Southern whites of rights which were essential to their whole conception of life. He was the perfect type of that narrow fanaticism which erudition and egotism combine to produce, and to which political crises alone give the opportunity for actual achievement.

Henry Wilson is pilloried as a Senator "whose sympathy for the down-trodden was no less demonstrative than his colleague's, but whose tears in their flow never for a moment distorted his count of the votes to be gained for his party"; while George S. Boutwell "exemplified perfectly the hard, merciless type which the Puritan conscience makes of a mediocre man." As for Grant, his "malodorous" career as President showed him to be, what he was at the beginning, "a narrow, headstrong, and politically untutored military chief," with a "lack of matured judgments on public affairs," and "an utter lack of ability to judge men."

These are unquestionably severe judgments, though the careful accuracy of Professor Dunning's narrative, well fortified with references to the sources, forbids us to pronounce them hasty. Revealing, as they do, sides of personal character on which writers of the patriotic sort do not care to dwell, they serve to show how far the pendulum has swung from the time when those who carried through the policy of reconstruction were saints or seers, and those who opposed it were fools or knaves. Perhaps, if Professor Dunning had been permitted to work on larger lines, the weaknesses and asperities of his figures would have blended better with the something impressive which men of the time recognized in them; though it has to be confessed that, if one must have a hero, the reconstruction period is a barren field to search.

The Near East. Anonymous. New York: Doubleday, Page & Co. $3 net.

Through Savage Europe. By Harry de Windt. Philadelphia: J. B. Lippincott Co.

Russia and Austria, as the agents of the European Concert for the pacification of Macedonia, have recently been showing signs of renewed activity, an activity which has brought the Balkan peninsula and its crucial problem into increased prominence. Both these volumes, therefore, have timeliness in their favor. It may be said at the beginning, however, that their contribution to a possible better understanding of the Balkan Question consists far less in any addition to our knowledge of actual political conditions than in a description of the Balkan country and of the people among whom the historic problem of the Near East is being painfully worked out. Harry de Windt needs no introduction as an old traveller and a pleasing raconteur whose light narrative carries with it the evidence of close and just observation.

So much cannot be said for the English author of "The Near East," who starts out under the serious handicap of a pompous introduction which the contents of the volume do not at all justify. We are told in the Preface:

> The reason of the anonymity of this book is obvious. Revealing as it does the actual state of affairs in the Balkan Peninsula in this present year of grace 1907, it contains many plain truths and much outspoken criticism. By a long journey of close, confidential inquiry through Montenegro, northern Albania, Dalmatia, Bosnia, Herzegovina, Servia, Bulgaria, Rumania, Turkey, and Macedonia, I have at risk of betraying certain information imparted to me under seal of secrecy endeavored to place the actual and serious truth before English readers. . . . Private audiences were granted me by various kings and princes of the Balkan States and by his Imperial Majesty the Sultan, so that I was enabled to gather information, some of which is, of course, known in the chancelleries of Europe, while other facts will probably come as a revelation, even to Balkan diplomats themselves.

Now this is silly pretence. All the political information contained in "The Near East" is not only known to the European chancelleries, but almost all of it is known to the keeper of the files of American newspapers. According to the author's own account of his interviews with royalty, the kings and princes of the Balkan peninsula seem to have agreed in declaring that they admired England, were on the best terms with Germany, Austria, France, and Italy, entertained the warmest sentiments for Russia, maintained the most amicable relations with their Balkan neighbors, and had nearest to their hearts the welfare of their subjects and their land, whose just interests they were prepared to maintain without trespassing on the rights of others. These are not particularly inflammatory sentiments, and the traveller who gave them to the world, might have laid aside his anonymity without exposing himself to the serious consequences of royal and princely resentment.

It is such affectation that makes it hard to do justice to the elements of merit in the volume—its description of men and manners, which though frequently overpicturesque is nevertheless instructive; its account of the little known territories of Bosnia-Herzegovina under the Austrian régime, which is depicted in very black colors, and its statement of the case for the present régime in Servia. The style of the book is slovenly. Such expressions as "The rival one night took his rifle and laid in wait for my brother," and "Palok, whom I found was not known," are quite as atrocious in their kind as anything the Turks have done in Macedonia.

Mr. de Windt's itinerary was largely the same as that of our other traveller. His Savage Europe comprises Montenegro, Bosnia, Herzegovina, Servia, Bulgaria, Rumania, and southern Russia. Of the mountainous western portion of the peninsula the impression given is altogether pleasing; a Switzerland inhabited by a semi-Oriental people, where racial and personal feuds appear only to invest care-free life with an additional charm. In Bosnia and Herzegovina the author of "Savage Europe" takes a view quite opposite to that we find in "The Near East," with regard to the Austrian rule. The difference in attitude is still more marked when we come to Servia, which the reader will find the most absorbing portion of the volume. Mr. De Windt's condemnation of the series of events by which the present King came to power is thorough, and his account of the assassination of the young King Alexander and Queen Draga is the most vivid we remember reading. The culmination of the tragedy is thus described:

> Even his enemies admit that Alexander's last moments were characterized by almost superhuman coolness and heroism. Both he and Draga must have known from the moment Maschin and his cut-throats burst into the sleeping apartment, that their fate was sealed. Draga was cowering in a corner shaking with terror, while the King, revolver in hand, tried to shield her person from the gaze of the brutal intruders. Colonel Maschin was the first to stride up to the King with a document for his signature—a promise to banish Draga forever from Servia, or abdicate. Alexander made no reply but fired point-blank at the speaker—missing him—upon which a volley laid the King low. It was now Draga's turn. . . . The corpses were thrown into the gardens below, where they lay until the Russian minister found them at daybreak. The King had lost the fingers of both hands, and had received no less than thirty-six bullet wounds, the Queen only sixteen.

And to the present day Belgrade has remained a city of assassination and ominous unrest. It is all the more surprising therefore to read of rural Servia as a "garden land" and of its inhabitants as a peaceful, laborious and prosperous peasantry, quite undisturbed by the murderous dissensions of their rulers. These facts help the historical imagination to recall how the Roman world once lived in security under a succession of Neros and Domitians.

The Tomb of Iouiya and Touiyou. The Finding of the Tomb, by Theodore M. Davis; Notes on Iouiya and Touiyou, by Gaston Maspero; Description of the Objects found in the Tomb, by Percy E. Newberry; Illustrations of the Objects, by Howard Carter. Folio. Pp. xxx., 48. 44 plates. New York: E. P. Dutton & Co. $12.50.

One can find only words of praise for the work done by Mr. Davis in his explorations in the "Valley of the Kings" in Egypt, opposite Luxor and near the site of ancient Thebes. Those who visited the museum in Cairo early in the season of 1906-7 saw the things which he found in a tomb in a most unexpected place and in an unpromising site in January, 1905; and those who were late in Egypt last winter saw some of the objects which he had just unearthed. First came the funereal furniture and the mummies of the parents of the great Queen Tii, and second the remains of the Queen herself. To have found these things is a sufficient honor for one man but they are only the crown of former achievements.

In his publications also, Mr. Davis shows excellent taste. His own contribution to his book is brief and modest, but it is the story of a man who knows whereof he speaks. In the present volume, as in those which have preceded, he has enlisted the aid of specialists, so that the publication takes its place at once as a valuable contribution and as a definitive work.

The significance of the present find from a historical point of view is in the fact that the supposed Asiatic parentage of Queen Tii is seen to be based upon erroneous grounds. This exploded theory was used to account for the origin of the new form of religion introduced by Khuenaten, the "heretic" King, son of Tii, as though it were a Semitic importation. But it is now seen that the parents were native, and undoubtedly of humble if not obscure origin; that they held inferior positions in the Court retinue, and were far from having the royal blood of Syria in their veins. We get a hint, at least, of a possible romance in the marriage of the King with a lowly maiden; but subsequent events show that she was held in the highest honor. The King, her husband, goes out of his way to mention both her and her parents in as unlikely a place as some huge scarabs on which he records his exploit of killing with his own hands "one hundred and ten lions fierce ones." Three of these scarabs are now in the Metropolitan Museum in New York.

Madame de Staël and Benjamin Constant. Unpublished Letters, edited by Baroness Elisabeth de Nolde; translated from the French by Charlotte Harwood. New York: G. P. Putnam's Sons. $1.50 net.

What little is known of Mme. de Staël's correspondence is both disconnected and scrappy, the result of publications undertaken, at long intervals and somewhat at random, generally by unauthorized editors. From letters written by the Duchess de Broglie in 1831, and a statement by the Duke de Broglie, in 1844, we gather that the heirs of Mme. de Staël, and Mme. de Staël herself, were strenuously opposed to such publications. This last batch of letters has been unearthed from the archives of the Marenholtz family in Hanover, and edited by the great-granddaughter of Benjamin Constant's second wife. The editor has not been content to give what unpublished letters, some twenty-eight in number, she found among those that Mme. de Staël wrote to Constant from England, Paris, Coppet, and Pisa during the years 1813 to 1816. With the aid of Constant's "Journal Intime," and some other correspondence already published by A. Strodtman in his "Dichterprofile," the Baroness de Nolde set out to give us a complete and interesting, if not very well composed, history of the whole *liaison*. We learn little in it, however, that we did not know already, and we understand the repugnance of the family to have their ancestor's sentimental life exposed once more to the public gaze. These whinings of a jilted woman, these love quarrels, complicated by business differences, this exchange of bitter words and ugly threats between two great minds make unpleasant reading, in spite of occasional flights into the more serene realm of political philosophy.

The reader may smile at the efforts of this mother to "establish" her daughter and her naïve complaint that England offers few matrimonial chances, because "there are so many women and so much money." It is also pathetic to see Corinne clamoring to recover her 40,000 francs from a man whom it would "hurt less to see her die of grief" than "to have to pay his debts." But these earthly cares, if they disillusion us a bit, do not detract from our admiration for a great writer who happened, at the same time, to be also a woman and a mother. Benjamin Constant, on the other hand, to whom she once wrote, "No one can have loved you as I love you," and again, "O, Benjamin, you have destroyed my life," and finally, "It [your conduct] passes all that I believed of the human heart," appears all through this correspondence, where he plays a silent part, a monster of flippant selfishness.

This edition, prepared by two women, bears many marks of inexperience. It might have been easy to spell at least the name of Rocca, Mme. de Staël's second husband, without a mistake.

Science.

American Birds. By William L. Finley. New York: Charles Scribner's Sons. $1.50 net.

On opening this book one is struck by the unusual excellence of the illustrations, most of them by H. T. Bohlman. Even in this era of nature photographs these of wild birds, their nests, and their young, are remarkable, perhaps, as a whole, the best thus far produced. Unhappily, they have suffered considerable reduction, in order to put three or four on each inset page.

The text is divided into twenty-one chapters, each treating some one species or group of species, from the hummingbird to the golden eagle. Since most of the studies were made in the extreme West, many of the species are little known in the East; but with few exceptions all have closely related Eastern representatives, with habits differing but slightly. The facts relate chiefly to the conduct of parents at the breeding season and to the appearance, growth, and general characteristics of the young. The text is uneven. Some chapters are excellent and thoroughly enjoyable: others are spoiled by a padding of unimportant details of uninteresting actions. Many new points in avine economy are, however, brought out, such as the division of the labor of feeding the young by the grosbeak, the parents bearing the brunt of the work on alternate days. The action of the male wren is unusual, when he takes the worms from the too fond mother, and, by tantalizing the young, inveigles them from the nest to their first flight. It will be news to many that the kingfisher, "in the Southern States, where the streams are few and run dry in summer, . . . takes to a fare of grasshoppers and mice." Mr. Finley's frequent allusions to the value of birds to man and the importance of protecting them more adequately are timely, for the day is rapidly approaching when every farmer must give this question more serious attention or lose an increasing percentage of his crops from the depredations of insects.

Mr. Finley seems rather uncertain of his scientific names, as instanced by the spelling of those on pages 109 and 115. The brief family summary at the end of each chapter is of little use and might better have been omitted. The work is accurate as to observation and forms a real addition to our knowledge of Western bird life. It is, however, as a splendid record of the photographer's skill in portraying the more intimate home life of wild birds that the volume deserves especial mention.

G. P. Putnam's Sons announce for publication early this year "The Prolongation of Human Life; Optimistic Essays," by Elie Metchnikoff, sub-director of the Pasteur Institute. This, the authorized English translation, is edited with an introduction by P. Chalmers Mitchell, secretary of the Zoölogical Society of London.

Henry Holt & Co. are issuing at once in their American Nature Series a popular one-volume work, "Fishes," by President David Starr Jordan of Leland Stanford University, which contains virtually all the non-technical material from the author's larger work in two volumes, "A Guide to the Study of Fishes." There are nearly 700 illustrations, 18 of them colored.

Dr. Hermann Hack's "Geographen-Kalender, fünfter Jahrgang 1907" (Gotha: Justus Perthes), records the geographic movement, so to say, of 1906 with German thoroughness. Opening with a biographical sketch of Professor Dalla Vedova, of the University of Rome, the compiler goes on with a *geographische Chronik* arranged by countries giving every item that could possibly concern a map-maker. To illustrate, our eye falls on the statement that on May 22, a forest fire destroyed seven villages in Michigan, besides partly burning others. Thousands of other similar records show how broad is the German conception of the basis of geographic science. This department is illustrated with maps, among which we notice one of the proposed channel tunnel, another of the lava flow of Vesuvius in 1906, and still a third of the African Railway system. Parts III. and IV. are respectively devoted to the explorations of 1906 (with maps), and to a very full geographic bibliography of the same year. Part V. is necrological, and VI. is a directory giving the name, place of residence, position, and where possible, date and place of birth of every living person in any way connected with any subject bearing on geography. There are indexes of both subjects and names.

The well-known "Allgemeiner Handatlas" of Andree, in large folio, 17x11½ inches, has just been issued by Velhagen & Klasing, Leipzig, in a fifth edition, correctly described as *vollständig neu bearbeitet und vermehrte*, under the editorship of Dr. H. Scobel. It contains 130 chief charts and 162 of a secondary character, published on 207 sheets, and costs 32 marks. A list of more than 240,000 geographical names, with reference to the different charts, is a valuable feature of this standard work.

The radio-activity of mineral springs has been one of the year's subjects of investigation with some curious results which, with increased observation, may have an influence in therapeutics. Pierre Curie had already collected helium in many mineral springs, and it has been found in the air. Prof. Charles Moureu of the École Supérieure de Pharmacie has studied various springs at the spot where the water gushes from the ground. He finds that they give out continuous emanations of radium and comparatively large quantities of such rare gases as argon, neon, and helium. The single spring of the Lymbe at Bourbon-Lancy yields annually more than 10,000 litres of helium. The Académie de Médecine commissioned three young physicians, having proper scientific attainments, to study certain well-known springs. M. Ameuilles found Plombières and Bad Gastein in Austria the most active, with an emanation which has all the properties of radium emanation. The sediment is also radio-active, and the surrounding atmosphere lightly so. An observation, which explains why it is not the same thing to use bottled waters and "take the waters" at the springs, shows that this radio-activity disappears in a short time; within four days half of it was lost in water taken away from the spring. It is even probable that all spring water, taken at its source, is slightly radio-active.

Coleman Sellers, engineer and scientist, died in Philadelphia December 28. He was born in Philadelphia in 1827, and while still a young man invented a number of tools and machines. In 1861 he patented the kinematoscope, a forerunner of the modern moving-picture machine. He became much interested in photography, was one of the founders of the Philadelphia Photographic Society, and acted as American correspondent of the *British Journal of Photography*. He also invented some useful aids in microscopic work; and for three years he served on a commission appointed by the University of Pennsylvania in 1884 to study the phenomena of spiritism. When the project of generating electricity at Niagara was set on foot, he represented America on a commission of five members, headed by Lord Kelvin, then Sir William Thompson. He acted as chief engineer of the construction, and devised important features of the great dynamos. He was a member of many learned societies.

Drama.

Franz Grillparzer and the Austrian Drama, By Gustav Pollak. New York: Dodd, Mead & Co. $2.50 net.

The Austrian drama plays an important part in German literature and the German theatre; and the life and work of its foremost representative in the first half of the nineteenth century have been the subject of much psychological speculation and æsthetical analysis. Mr. Pollak's book is the first attempt, outside of our college world, to introduce Franz Grillparzer to American readers. He has written a sympathetic study of a character very difficult of comprehension if viewed apart from the circumstances of time and place. As a son of the country which gave birth to the poet, Mr. Pollak is singularly fitted to interpret Grillparzer's isolation in life and unique position in letters.

Many threads connect Franz Grillparzer with his contemporaries and compatriots. He stands among them a typical Austrian of the Metternich period, loyal to the monarchy and unquestioning in his attitude toward the privileges of bureaucracy and the prejudices of caste. But while as a man he upheld principles fast becoming obsolete in other parts of Europe, as artist he chafed under the pressure which resulted from the enforcement of these principles, and disastrously affected the intellectual growth of Austria. This somewhat aristocratic attitude set him apart from his forerunner in the Austrian drama, Raimund, as also from his greatest successor, Anzengruber. A son of the people, Raimund wrote out of his proletarian consciousness. He strove to console the poor by idolizing poverty. Grillparzer, however, had no sympathy with the people as such. Keeping aloof from his own class, he revelled in morbid self-analysis. Engrossed with the eternal conflict between instinct and reason, he made this the pivotal point of his works. This weary pessimism hung like a cloud over his life, and vibrated like a dismal undernote through his writings. It began, as Mr. Pollak points out, in the sombre parental home, ruled with the iron rod of discipline by a stern father, who sought no intimacy with his children and rigidly suppressed his emotions. Yet the poet had inherited his father's clearness of intellect. The first play by Grillparzer, "Die Ahnfrau"—The Ancestress—was written in a gloomy old house with "enormous rooms, into which a ray of sunlight rarely penetrated." Only the mother, emotional and impulsive and endowed with an extraordinary gift for music, which the children had inherited, could have given the poet the affection needed to balance his intellectuality. But after having so long repressed his feelings, he was hardly capable of apppreciating affection. Indeed, after a betrothal of five years' standing to Katharina Fröhlich, he came to the conclusion that he was incapable of true love. These points, so essential to a just estimate of Grillparzer's work, Mr. Pollak makes clear.

The connection between the life and the work of Grillparzer is very close. Mr. Pollak finds in the plaint of Sappho, beginning with the line "To lose and to renounce has been my lot," a direct allusion to his own misfortunes. Founded upon the conflict of art and actuality, the "Sappho" is hopelessly pessimistic. The first play, which suggests a brighter outlook upon life, was written during his early acquaintance with "Kathi"—that masterly historical drama "König Ottokar's Glück und Ende"—embodying the glorious past, the perilous present, and the brightly dawning future of the Austrian empire. Mr. Pollak's exhaustive quotations are likely to create an interest in this too little known yet remarkable work. Of all his works, "Libussa" has the most hopefulness. It contains prophetic lines which show that the author had caught a breath of the new spirit. In the splendid procession of his heroines—Sappho, Medea, Hero, Esther, Rachel and others—the superb figure of Libussa is the crowning achievement.

One chapter of Mr. Pollak's interesting volume is devoted to Grillparzer's miscellaneous writings. The author justly remarks:

> A certain acerbity of sentiment and obscurity of expression—occasionally even a slovenliness of form, of which his dramas fortunately bear so few traces—detract from the value of his poems.

Mr. Pollak quotes from the prose writings numerous passages, remarkable for their critical insight and independent judgment. Grillparzer's only attempt at fiction, the well-told story "Der arme Spielmann," might have received a little more attention, for, although it reflects throughout the poet's resigned mood, it strikes one note foreign to his other writings in the passage where he says that at the feasts of the people "Men as a mass forget for the nonce individual aims and feel themselves as a part of the whole, in which, after all, the divine element is to be found."

The contrast between Grillparzer and his great successor, Anzengruber, is striking. The son of a petty official, but a child of the second half of the century, Anzengruber was the mouthpiece of the democratic consciousness to which the people of Austria had begun to awaken. The first and perhaps the greatest of German realists, Anzengruber, created characters which are genuine products of the soil. and made them utter all the new aspirations that were working their way upward out of the people's soul. A final chapter tracing the development of the Austrian drama since the death of Anzengruber would have been welcomed by some readers. For, though the boundary lines between Germany and Austria are beginning to fade away in the literary world, there is still a quality in the work of the young generation of that country which is typically Austrian. As the spirit of Anzengruber's social consciousness seems to linger in Langmann's "Barthel Turaser" and the shadow of Grillparzer's pessimism to hover over the poetical dramas of Hoffmannsthal, so Schnitzler and Bahr represent the cosmopolized Vienna of to-day.

The metrical translations are an important feature of the book. With few exceptions they render with uncommon success the meaning and melody of the original.

Among the younger English actors there is perhaps no one more likely to become a dominant figure than H. B. Irving, the eldest son of the late Sir Henry. Not only has he inherited no small share of his father's histrionic ability, but he is a man of studious and scholarly habit, industry, and ambition. There is abundant evidence of his solid character and capacity in his "Occasional Papers, Dramatic and Historical," now collected in a convenient volume and published by Small, Maynard & Co., Boston. These essays, although dealing for the most part with rather hackneyed subjects, are nevertheless written with so much comprehension, directness, and sobriety of judgment that they make pleasant and by no means unprofitable reading. His account of the eighteenth century stage is an admirable summary, notable for compact arrangement and judicious selection of vital matter. He fails, however, to perceive that the brilliancy of that theatrical period was due, in large degree at all events, to the adverse social conditions which he deplores, and that the deterioration of theatrical art has proceeded in almost exact ratio with the increase in the general popularity of the stage, and the success, both social and commercial, of its professors. What the stage needs to-day for its rehabilitation is not, as he seems to think, a larger measure of patronage and protection, but a time of adversity and trial, to purify it of its diseases, starve out its weaklings and impostors, restore a healthful if cruel competition, and so prepare, through a survival of the fittest, for the establishment of a new era of literary and dramatic achievement. What he has to say about the art and position in the world of the actor shows sanity and shrewdness of observation, together with a realization of the obligations and opportunities of his calling, and a proper pride in belonging to it. He also makes out a good case in defence of actor-managers, to whom, as a class, the stage doubtless has owed in the past much of its progress; but, there is another side of the picture, which shows the evil influence of a theatrical dictator whose sole aim is to make money and gratify his own vanity. His plea that a manager ought not to be blamed too severely for occasionally stooping to folly in order to win from the public the support upon which his very existence depends is plausible but specious. The ideal, and, in the long run, the wisest policy, is to woo success, after failure, by providing something that is more, not less, worthy of it. Mr. Irving ekes out his theatrical papers with one or two of his criminological studies, which are, perhaps, more curious than valuable. But lovers of the stage will find in this book assurance that the author has at least one rare qualification for the theatre, namely, brains.

The performance of Ibsen's "Rosmersholm" in the Lyric Theatre, Monday evening, attracted a large audience, and was received with appreciative applause for the actors, but with very little enthusiasm. There is small ground for belief that the experiment will prove popular. It would be difficult to name another play, of equal dramatic quality, more empty of inspiration. The peculiar genius of the author is displayed in the smooth, compact, and rapid mechanism, in the graduated climaxes leading to the final catastrophe, in the vital portraiture of the male characters, and in the vigorous political satire; but these merits are not sufficient compensation for the gloom and morbidity of the central theme. The various political types—Rosmer, the unpractical idealist; Kroll, the conscientious but narrow and bigoted conservative; Brendel, the visionary wastrel; and Mortensgard, the unprincipled trimmer—are drawn to the life; but Rebecca West, the embodiment of free will and the force that dominates the whole dramatic action, is a creature as impossible as she is detestable. Her conversion is incredible, and her so-called expiation absurd. Nor has Mrs. Fiske, who now assumes this part, the requisite power of emotional expression to disguise the dramatic and psychological unreasonableness of the closing situation. Rosmer's faith in the miracle of her transformation, supposed to have been effected by his own goodness, and his agreement that suicide may be equivalent to atonement and the symbol of a purified love, carry no conviction. The general representation was uncommonly good, George Arliss distinguishing himself by a very clever sketch of Brendel.

Judging by the printed reports, Sardou's latest theatrical invention, "L'Affaire des poisons," recently produced at the Porte St. Martin, in Paris, is in no wise inferior to his earlier melodramas, in respect of compact construction, ingenious plot, cumulative interest and striking climaxes. The question of its actual artistic, literary, dramatic, or historical value, is another affair, of course. But there seems to be no doubt that it is good carpentry. Coquelin is reported to do excellent work as the central figure, an escaped prisoner, who having obtained a clue to a plot against Louis XIV., in which Madame De Montespan and the chemist, La Voisin, are concerned, makes use of his knowledge to secure a pardon for himself.

The Vicomte Robert d'Humières, the French translator of Kipling, Barrie, and others, has recently organized a Theatre of the Arts. His object is to introduce to the Parisian stage a certain number of pieces characteristic of foreign art. The plan is to alternate French and foreign works. The dramatized version of "The Light That Failed," by Kipling, adapted by the Vicomte d'Humières; "The Notorious Mrs. Ebbsmith," and "Iris," by Pinero; revivals of the Elizabethan drama, and of the comedy of the Restoration, Webster's "Duchess of Malfi," and Mrs. Patrick Campbell in "Hedda Gabler" and "Electra," are English items on a list that includes works by Wedekind, Kampf, Sudermann, Maurice Maeterlinck, Tristan Bernard, Renan, "Gyp," Georges Courteline, and Mme. de Régnier ("Gérard d'Houville"). On Tuesdays and Saturday matinées are to be given at five o'clock, consisting of a series of lectures on literature, science, painting, music, travels, etc. MM. Saint-Saëns, Vincent d'Indy, Paul Adam, Comte de Montesquieu, Dr. Charcot, and Dr. Mardrus will lend their aid.

Music.

Richard Wagner. Von Max Koch. New York: Lemcke & Buechner.

While Karl Friedrich Glasenapp is still at work on his monumental life of Wagner, which threatens to comprise as many volumes as a Chinese cyclopædia, others have not been idle in appropriating the fruits of his labors. The latest German biography of the great composer is by Prof. Max Koch of the University of Breslau. Only one volume is in print so far; it comprises the years 1813-1842, and contains nearly four hundred pages. The two remaining volumes will thus help to make a work of about 1,200 pages. This will hardly suffice for an exhaustive work on Wagner; but that it will be exhausting, is indubitably proved by the first volume.

No musician ever had so romantic and dramatically interesting a career, from beginning to end, as Wagner. It seems impossible to write an uninteresting account of his life, yet Professor Koch has accomplished this feat. His story of Wagner's life is about as absorbing as a textbook of archæology to the general reader. He seems to have an aversion to those minute details which help to give a life-like view of a man, while on the other hand he dotes on the minutest details regarding matters which have only the remotest bearing on the subject in hand. There is seldom a page of straightforward narrative, the discourse being interrupted every moment by irrelevant, or, at any rate, superfluous, matter. An amusing illustration of this pedantic method occurs on p. 184, on which reference is made to Wagner's first visit to Vienna, where, as the composer adds casually, he was annoyed by hearing the "Zampa" tunes everywhere. This leads our author to inform the reader:

> The most successful opera of the Frenchman Louis Joseph Herold (1791-1883) "Zampa, or the Marble Bride," had its first performance in Paris on May 3, 1831; in Vienna on May 3, 1832—Leipzig followed on September 17—and, as later, in the case of "Tannhäuser," the playwright Johann Nestroy had in 1832 at once prepared a parody, "Zampa the Sluggard, or the Bride of Gypsum," which during Wagner's sojourn in Vienna, was as popular as the opera itself.

There is hardly a page without an interpolation of this sort, and sometimes several pages are thus filled. An explanation of this peculiar method of literary composition may be found in the fact that Koch dispenses with the footnotes so dear to the German professor.

A careful examination of this volume has failed to reveal any important fact bearing on Wagner's life not noted by previous biographers. The facts regarding Wagner's doubtful paternity are more fully presented than elsewhere (pp. 36-37) and they make it almost certain that his real name should have been Richard Geyer. The author lays much stress, and properly, on the fact that it was through poetry that Wagner, from the beginning and always, approached music. He corrects a prevalent misconception in pointing out that Liszt was not a pupil or imitator of Wagner in composition. Liszt was already writing his symphonic poem "Ce qu'on entend sur la montagne" when Wagner was at work on his utterly unoriginal juvenile symphony. In commenting on the fact that Wagner's setting of Heine's "The Two Grenadiers" never became as popular as Schumann's (both introduced the Marseillaise at the end), our author mentions the fact that while Schumann gave this melody to the singer Wagner placed it in the piano part, but he apparently fails to see that this error on Wagner's part accounted for the preference shown for Schumann's song. Professor Koch is obviously one of the old guard who are convinced that Wagner never erred.

By far the most valuable section of Professor Koch's book is the bibliographic appendix of forty pages. He complains that his predecessors, including Glasenapp, did not sufficiently indicate the sources of their information. His appendix goes far toward remedying this omission, and he promises to complement the list in the two volumes still to come.

Prof. Ernst Wolff of the Conservatory of Music in Cologne, whose excellent biography of Felix Mendelssohn-Bartholdy appeared in 1906, has just published (Berlin: Behr) an admirable selection of the letters of the distinguished composer. Wagner, it will be recalled, described Mendelssohn as "a first-class landscape painter," a designation which applies with equal force to his letters. They are remarkable for clearness and vividness of delineation. Thus in a letter from Switzerland written when he was thirteen years old to his teacher Zeller, he shows a fine observation of nature rare in a boy of that age. Peculiarly interesting are the letters to Goethe and Moscheles and the descriptions of his life in Munich in 1830 and 1831, which he found more congenial than any other German city.

Eugen D'Albert has been chosen director of the Berlin Royal Academy of Music, as successor to Joachim—one of the most coveted and influential positions in Europe. But it is as an opera composer that he has chiefly come into prominence lately. After writing several operas which were failures, he at last composed one—"Tiefland"—which nearly every German opera house hastened to perform. Spurred on by this success D'Albert's pen in a short time turned out another score, which was promptly produced at Hamburg. It is "Tragaldabas," based on a French comedy of that name by August Vacquerie. This play was produced in Paris in 1848, and gave rise to a good deal of literary skirmishing. Among those who took part in the fight were Victor Hugo, Théophile Gautier, Murger, Balzac, George Sand, Alexandre Dumas, Girardin, Musset. There were violent protests against the play, but finally it conquered, and its admirers proclaimed its immortality. Oblivion followed soon. Accounts agree that the Hamburg audience which was first to hear the opera was not particularly edified. D'Albert makes much use of stopped trumpets and trombones, and vies with Offenbach in searching for humorous effects. But the opera was evidently written in a hurry, and there is not enough melodic invention to float it to success. It is not his first comic opera. His "The Departure," and "Flauto Solo" belong to the same genre. Both were failures.

Art.

The Gothic Quest. By Ralph Adams Cram. Pp. 358. New York: Baker & Taylor Company. $1.50 net.

This little book is made up of twelve distinct essays, some of them public addresses, some reprinted from the *Catholic World*, the *Magazine of Christian Art*, and certain American architectural journals. The dates of their first appearance range from 1893 to 1907. They are, however, singularly alike in tone and spirit: they breathe the same lofty purpose; they preach one uniform doctrine of fine art as a form of religious thought and religious enthusiasm. In saying "enthusiasm" there is always implied excess, however worthy the theme, and a tendency to unsupported assertion. For example, page 100 contains this sweeping generalization:

> We must cease looking on the house of God as a Sunday club; we must give as men gave in the fourteenth century; we must give with the spirit in which they gave, for if we give from motives of ostentation, emulation, self-glorification, our work will be as hideous as it is now, and we ourselves shall be deservedly damned.

It would not be fair to select that passage if it stood alone, but there is the frequent assertion and constant assumption that mediæval architecture in western Europe was indeed religious in its suggestion, pious in its purpose, and almost faultless in artistic character. Now the cautious historian may admit that there is a basis of truth in such dicta as these (p. 101):

> Luther killed all art but music in Germany. . . Calvin killed all righteous art in France. . . . Henry VIII. killed all art whatever in England.

Moreover, if the historian be also a worker in modern architectural art, he may regard as tenable the further proposition: "We must go back to mediæval times . . . and take up the work where then it was broken off." Where it was broken off: *i. e.*, not the early prime, not the thirteenth century, but the latest English Gothic is held up as a proper starting point for modern art.

Indeed, those of us who watch the growth of American art are aware of Mr. Cram's serious design. We know that the churches of his firm (Cram, Wentworth & Goodhue, or later Cram, Goodhue & Ferguson), when they are what Mr. Cram would call churches indeed, that is, buildings for Catholics or Anglicans, are always in a style founded upon just such study of the latest English Gothic, the Perpendicular, the Fan-Vaulted, the Tudor form of Gothic, which the above quotations bid us expect. Some years ago we used to hear in architectural circles the term Extended Gothic, used perhaps loosely for this modern development. The churches designed in this style by this firm are worthy of close study, and of much admiration; they show that the seemingly impractical aspiration of the writer has already been put into a way of realization. The artist and author is therefore properly impatient in asking that not merely the outward appearance of the places of worship, not merely the interior decorations, with sculpture and appropriate painting, that not merely these be brought back to the fourteenth-century stage of perfection, but that the whole body of the ceremonial be treated as a great fine art, and every part of it—costume, furniture, music, chanting, and recitation—that all be brought up to the noble standard set for us by mediæval Catholic worship. His thesis is:

> There is no other work of art more entirely perfect than a solemn High Mass forging its splendid way through the mysterious lights and the veiling incense of an old Gothic cathedral, to the sonorous beating of deep Gregorians. It takes rank with, and even above, the other triumphs of art.

With this as his aspiration the author cannot but be somewhat despondent. But the thoughtfulness of his reasoning, and his protest against the evil tendencies in modern architecture, deserve the attention even of those persons who cannot accept to the full the remedies suggested by Mr. Cram.

In the December number of the *Burlington Magazine* the department of Art in America spills over, so to speak, into the body of the magazine; for the frontispiece is a photogravure of Renoir's Mme. Charpentier and her Children, now in the Metropolitan Museum, and the leading article is a commentary on that work by Léonce Bénédite, who writes from the point of view of an ardent admirer of the much-discussed picture—a picture which, with all its impressionistic technic and its blue and pink coloring, has yet a certain kinship with the paintings of fashionable ladies by Cabanel. There are other works by Renoir, to say nothing of greater artists, unrepresented in our museums, that would have been better worth the great price paid for this one. The American section proper includes a reproduction of Brandegee's portrait of Miss Porter with a brief note upon it, a list of the works of Saint-Gaudens, which, though it includes one hundred and seven numbers, is far from complete, and an illustrated article on the Burgundian tapestries in the Metropolitan. The rest of the issue is of the usual varied substance, one of the most interesting items being the clear evidence of Watteau's borrowings from Rubens shown in a drawing in the British Museum after one of the paintings now in the Louvre.

"The Palaces of Crete and Their Builders," by Angelo Mosso, an account of the results of the excavations in Crete by the British and Italian Schools of Archæology, will soon be issued by G. P. Putnam's Sons.

An important fresco by Masolino da Panicale has been discovered by F. Mason Perkins, who communicates his find to the *Rassegna d'Arte* for December. The group, an enthroned Madonna and Child with angels, appears to be the central portion of a larger composition. It may be seen in the Church of S. Fortunato at Todi. The article is accompanied by several cuts of details on a generous scale which fully establish the attribution. One wishes that the *Rassegna* might always practise this wise liberality, for its illustrations are too often in disheartening contrast to the valuable text they accompany. In this number, Dr. Gerevich continues his exhaustive study of the beginnings of the revival of painting in Bologna. Lorenzo Costa is the theme of the present instalment.

If it was worth while to do over again so soon what Samuel Isham had done so well in his "History of American Painting," Charles H. Caffin has done it fairly well in "The Story of American Painting" (F. A. Stokes Co.). If not an original critic, Mr. Caffin generally knows where to go for opinions or information, and seldom makes serious mistakes. In type, paper, etc., the book is an ugly one, and the printing of illustrations on both sides of the paper is an ill-judged economy, while the lines of comment, in italic type below the pictures, are disagreeably disturbing. For these things Mr. Caffin is, presumably, not responsible, and he has provided an amount of information and of sensible remarks thereon that will doubtless be welcome to the public for which such books are provided.

For a similar public, anxious for easily assimilable instruction in art, Miss Estelle M. Hurll has provided a very rudimentary form of it in her "Portraits and Portrait Painting" (Boston: L. C. Page & Co.). Any child should be able to understand all that she has to say, or at least to repeat it with an air of understanding, which is perhaps, all that is necessary. There are errors in the book, which it is hardly worth while to point out, but it is harmless and unexciting.

The special committee of trustees of the American Academy in Rome, empowered to select three scholarship men, one each in architecture, sculpture, and painting, to receive $1,000 a year for three years, has chosen Ernest Farnham Lewis of Boston for architecture, and Sherry E. Fry, now in Europe, for sculpture. It was decided not to appoint a painter this year. For the proposed endowment fund of $1,000,000, subscriptions of $100,000 each have been received from J. Pierpont Morgan, Henry Walters, William K. Vanderbilt, James Stillman, Henry C. Frick, and Harvard University through Henry L. Higginson. Efforts to raise $100,000 each are also being made by Yale University, Columbia University, the University of Chicago, and the Society of Beaux Arts Architects. None of the subscriptions has been called in; but the founders have placed in the treasury of the academy an amount equivalent to 4 per cent. on their subscriptions to meet the current expenses.

Among the exhibitions at the dealers' galleries in this city are water colors by Herbert W. Faulkner, at Powell's, till January 11; modern Dutch, Barbizon, and early English paintings, Scott & Fowles's; etchings by Miertatz, William Schaus's. An exhibition of drawings by Rodin will be held at the rooms of the Proto-Secession, No. 291 Fifth Avenue, January 2 to 21.

John Lambert, painter, died December 29 at Jenkintown, Pa. He had been ill for some time, and late last summer was compelled to cease working in Spain because of failing eyesight. Born in Philadelphia in 1861, he studied at the Academy of Fine Arts in Philadelphia, and afterwards in New York, Paris, and Naples. He first exhibited at the Philadelphia Academy of Fine Arts in 1895, and his last work was a portrait of Albert Chevalier, the coster singer, in the character of "'Awkins." Among his other pictures were portraits of Selden Miller, John R. Read, and Miss Cecilia Beaux.

Finance.

THE REPORTS OF THE BANKS.

When the reports of the national banks of New York city, made under the call of December 3, were compiled more than a fortnight ago, they threw on banking conditions but little more light than the weekly statements. But some questions of interest remained. Had interior banks reduced their loans while New York banks were increasing them, and added to their cash reserve while New York's was being depleted? Between October 24, the panic day, and December 3, the date of the reports, $41,000,000 in cash had been deposited at New York by the government, and not much less than $70,000,000 of gold had come in from Europe. Yet in that period cash holdings of the Associated Banks of New York city had actually decreased $43,000,000. Where had this $154,000,000 of actual money gone? Partly into the hoards of private individuals; partly into other local institutions. But inland banks are known to have drawn cash heavily from New York. Was this currency used to make good the ravages of hoarders at other cities than New York, or was it added outright to interior bank reserves? Only the statements of these inland banks could tell the story.

These are the changes, between August 22, the date of the preceding call for reports, and December 3; the comptroller of the currency's compilations are used:

	N. Y. City alone.		Outside of N. Y.	
Loans	Inc.	$59,396,000	Dec.	$152,643,000
Individual deposits	Inc.	96,266,000	Dec.	238,428,000
Due from other banks	Dec.	6,216,000	Dec.	140,726,000
Due to banks & trust cos...	Dec.	27,412,000	Dec.	196,265,000
Cash	Dec.	43,159,000	Inc.	2,320,000

The figures for national banks outside New York will be received with astonishment. That these institutions should have cut down loans enormously while New York was increasing them, was expected; the change is explicable mainly through the recall by Western banks of their large credit accounts outstanding in New York—a process which forced New York institutions to replace a part of these loans by actual increase of credit facilities on their own account. But what was not expected is the evidence from these figures, first, that interior banks have not called in, from New York and elsewhere, as much of their own deposits with other institutions as they have lost through recall of similar deposits from themselves; and second, that these inland banks have not heaped up a pile of needless cash in their own vaults.

It is true that while New York's national banks lost $43,000,000 cash between August and December, banks in the rest of the country have lost none. But the $2,300,000 increase, at other places than New York, is a bagatelle when one considers the money poured into the banks in the interval. The difference in the result, at New York and elsewhere, is a plain enough consequence of the converging of the trust company run and the attendant money-hoarding, on this city; but the fact of an actual and heavy net loss of cash, by the whole system of national institutions, leaves the problem, as to the disposition of the gold imports and the treasury's cash deposits as puzzling as before.

The government did not restrict its deposits to New York; between August 22 and December 3, its deposits, in the national banks of the country as a whole, increased $80,000,000. This, with the gold importations of the period, must have added $150,000,000 to the joint holdings of these institutions; yet the comptroller's compilations of this week show that all the 6,600 national banks held less cash by $40,800,000 in December than in August. The use of cash in the harvest districts does not at all explain it. In the similar months of the normal years 1904 and 1905, the national banks lost respectively $19,000,000 and $43,000,000 from their cash reserves; in 1906, when we were large gold importers, they actually gained $8,000,000. None of these figures provides a parallel for the disappearance, during the same three months in 1907, of nearly $200,000,000 cash.

What is manifest, however, so far as these national bank reports are witness, is that the West has suffered with the East, that there is little ground for sectional recrimination, and that the salient fact of the period has been the prodigious extent to which these banks were entangled among themselves, and the violence of their raid upon one another. The evidence that this was largely a panic of banks, as distinguished from a panic of individual depositors, is quite irrefutable.

A curious light is thrown on the affair by comparison with the national bank returns of 1893. Between June 12 of that year—two weeks before the panic day—and October 3, the statements show the following changes:

	N. Y. City alone.	Outside of N. Y.
Loans	Dec. $27,300,000	Dec. $158,700,000
Individual deposits	Inc. 2,800,000	Dec. 107,800,000
Due to banks & trust cos...	Dec. 9,600,000	Dec. 6,400,000
Due from banks	Dec. 5,000,000	Dec. 16,000,000
Cash	Inc. 32,000,000	Inc. 24,600,000

In the matter of loans, these banks then acted much as they have done in 1907. But the $59,000,000 gold imported in the panic of 1893 had very clearly gone into bank reserves and stayed there, while the quite insignificant changes in the accounts of the banks with other institutions showed that no such tangle of institution credit can have existed then. But the currency premium, and the restriction on depositors at New York, disappeared in 1893 on September 2, and that of itself accounts for much.

BOOKS OF THE WEEK.

Almanach de Gotha, 1908. Lemcke & Buechner.
Aulard, A. Taine, Historien de la Révolution Française. Paris: Armand Colin.
Ballard, Eva C. She Wanted to Vote, or Home Influences. Crawfordsville, Ind.: T. F. Ballard. $1.40 net.

THE COURT OF PHILIP IV.
Spain in Decadence
By MARTIN HUME,
Editor of the Calendars of Spanish State Papers
Lecturer in Spanish History and Literature, Pembroke College, Cambridge.
8vo. With 8 Portraits in Photogravure. $4.00 net.
A series of pictures chronologically arranged of the life and surroundings of the "Planet King," Philip IV.—that monarch with the long, tragic, uncanny face, whose impassive mask and the raging soul within, Velasquez, the greatest portrait painter of all time, limned with merciless fidelity from the King's callow youth to his sin-seared age.

The Nation.

NEW YORK, THURSDAY, JANUARY 9, 1908.

The Week.

Two criticisms will probably be directed against the currency bill which Senator Aldrich has prepared: one, that it is an "emergency currency bill" rather than a comprehensive measure of reform; the other, that it adopts a highly questionable principle in accepting State, municipal, and railway securities as a basis for this currency. The plan provides for emergency bank circulation not to exceed $250,000,000; secured, not by United States bonds, but by the collateral authorized for savings bank investments by the New York and Massachusetts laws; taxed at 6 per cent. to ensure its retirement when the emergency is past; and limited by the veto power of certain designated Treasury officials. The authorization of miscellaneous collateral is not a new idea; it has already been applied in the matter of collateral against public deposits. In the case of banknote issues, however, it would mark a distinctly vicious tendency. Banknote issues must be regulated on one of two principles—automatic expansion or contraction in response to the needs of a season's trade, or artificial limitation by requirement of a collateral security whose total amount is known and whose soundness is recognized by every citizen. To neither of these theories does the Aldrich plan conform. Automatic contraction gets no encouragement at all, except from the 6 per cent. tax upon the notes, and conceivably banks might not wait for the real emergency to apply for the extra circulation, but might use their new powers to help along such Wall Street inflation schemes as those of 1905 and 1906. As for arbitrary limitation, the note-issues would be restricted, short of the quarter-of-a-billion maximum, only by the extravagance of cities and railway companies in their recourse to the money market.

Rear-Admiral Brownson's letter of resignation is dignified, admirably phrased, and strong in its presentation of his case. With his attitude in regard to the command of hospital ships, we do not agree; in this matter, the President seems to us in the right. We have also had occasion to regret Rear-Admiral Brownson's zealous advocacy of a huge fleet, and his stanch support of the bureau system, which is, we hope, now in a fair way to be abolished. But against his treatment by the President, we cannot protest too strongly. Mr. Roosevelt has often enough preached to the country about its duty to the veterans. Well, here is a man who fought through two wars with honor to himself and his country, and who, until he dared to disagree with Mr. Roosevelt, held the most influential post in the navy. But all this is forgotten in the President's anger at Brownson's refusal to continue to serve after he had lost the President's confidence, and this veteran naval officer is reviled in precisely the same intemperate terms as were the colored troops whom Mr. Roosevelt suspected of "shooting up" Brownsville.

The Supreme Court has cut up by the roots one of President Roosevelt's pet laws. The Constitutionality of a Federal employers' liability act was gravely questioned when the measure was under debate. As soon as it was passed and put into effect, it was contested in the lower Federal courts. On appeal, the Supreme Court, though by a divided vote, pronounces it beyond the powers of Congress, and so void. Thus ends one more attempt to draw out of the interstate commerce clause whatever may occur to any President as desirable. What the court has now done is once more to deny that the power of Congress extends to "every conceivable subject, however inherently local," and to affirm again that there is an "authority of the States" which Congress cannot obliterate. The President has been jauntily secure about this particular law, his only complaint being that it was not sufficiently "thoroughgoing." In his last message he declared that it "should be" extended. But now its fundamental principle has been destroyed by the Supreme Court.

A splendid display of loyalty to the President, Secretary Taft's address in Boston last week surely was. Though the Secretary has not been long enough back from the Philippines to get fully in touch with public opinion, he plainly has discovered that thousands of the President's former admirers and unthinking supporters are now covering him with reproaches. But Mr. Taft, in identifying himself with Mr. Roosevelt, steps forward to take his share of the obloquy. What the Secretary had to say about the genesis of our recent panic and continuing business depression seems to us in general entirely sound. He repeated the familiar arguments about inflation, top-heavy speculation, and reckless strain upon capital and credit. But Secretary Taft ought to understand that there is a sharp difference between the economic and the political explanation and effects of the panic. After you have proved to demonstration that bad financiering caused financial disaster, the fact remains that widespread financial disaster will be laid to the charge of the President in office and the party in power. There is a brutal side to politics, as Mr. Taft's party illustrated in the case of President Cleveland in 1893-95, and it is simply the same kind of political brutality from which President Roosevelt and the Republican party are now suffering, and will suffer. The times are bad; hence the imbecile party in office must be turned out. That was the invincible syllogism which the Republicans employed in 1893, and they cannot dodge its application to-day. Now, this consideration evidently haunts the whole of Secretary Taft's speech. He put the policy of the President in as engaging a light as possible. It was the policy of simple honesty and legality; a brave fight against giant corporations, and so on. Yes, but it was primarily a *political* policy. Political success was Mr. Roosevelt's great aim; indeed, it was essential to his method. But panic and depression have made that success highly doubtful. There may be a recovery of it; but at present it is admitted in Washington that the President's course is completely blocked. Congress will not assent to a single item of his distinctive programme. Thus a halt has necessarily been called in the policy which was never anything if it was not politically triumphant. But Mr. Taft stakes his fortunes upon it. He still sees in it what De Quincey called a "dower of golden hopes." At present, however, it must be confessed that it is a crushing burden for any candidate to carry.

Twice since the passing of the "Virginia dynasty" has a President of the United States undertaken to name his successor. Singularly enough, the principal in the second attempt has been a thoughtful critic of the first. Theodore Roosevelt wrote in his Life of Benton:

> The Jacksonian Democracy was already completely ruled by a machine, of which the most important cogs were the countless officeholders, whom the spoils system had already converted into a band of political mercenaries. . . . Besides this, such an organization requires . . . to have as its leader and figure-head a man who really has a great hold on the people at large, and who yet can be managed by such politicians as possess the requisite adroitness. . . . Jackson liked Van Buren because the latter had served him both personally and politically—indeed, Jackson was incapable of distinguishing between a political and a personal service. . . . [The members of the kitchen cabinet] used his name and enormous influence with the masses, coupled with their own mastery of machine methods, to bring about the New Yorker's nomination.

Who could have believed that these lines would one day apply with hardly more than a change of names to the ardent civil service reformer who penned them in 1886? If the Federal officeholders were "countless" then, what is to be said of their number to-day, when, despite the extensions of civil service rules, nearly 150,000 still remain outside the classified service? Washington gossip concerns itself just now with the prospect of having the First Assistant Postmaster-General, an official of the department charged with the destinies of 50,000 fourth-class postmasters, conduct the Taft campaign without giving up his post. To all appearances, Federal patronage is everywhere to be employed for the securing of Taft delegates.

The proposal to establish a commission to investigate and recommend changes in the tariff is backed this year by so loyal a Republican as Senator Beveridge. That it stands no chance at all of adoption is not due to any fear that such a commission would be dominated by free-traders, or that a really low tariff would result from its deliberations, but to the doctrine that to touch the tariff law at all would be to unsettle its structure so completely that it would be liable to topple over at any blow. For many years this has been good tariff logic, but it was seldom until this year that any one thought of applying it to other departments of legislation. The following extract from the correspondence of an important Republican paper is typical of what has been said since Congress convened this year about the revision of the reform legislation of 1905 and 1906, the rate law, the pure food law, the meat inspection law, and the like:

> Now that these enactments are on the statute books, and are in the main approved by the people, the legislators are not disposed to disturb them. The year just passed has unquestionably shown some defects in the laws in question, but the legislative leaders say that if an effort is made to correct the small defects the way might be opened for a general assault on the legislation, and so they are inclined to let the laws stand as they are.

Everybody agrees that, other things being equal, the less our laws are tinkered with the better. We are dealing now, however, with changes which, after such a trial as alone can demonstrate the qualities of any statute, commend themselves to the same wisdom that conceived the original laws. To refuse to amend amounts to a denial of the right to atone for a mistake or recognize a changed condition. The conception of these complete and self-sufficing statutes appears doubly strange when we contrast it with the traditional methods of our law-making. It is rare indeed to find all the law relating to a given subject in one place. As a rule, there is a nucleus somewhere, possibly far back in our national history, but to this are added amendments after amendments. Many of the methods of our lawmakers are to be condemned; but there has been a rough-and-ready flexibility about their work. The proposal to change all this, to draw the line at "reforming the reforms," is, to use a homely illustration, like trying to replace one of the loose-leaf railway guides by a duodecimo library edition of the time-tables, bound in morocco to last a generation.

Ambassador Aoki's declarations in San Francisco would seem to have omitted nothing that candor or fairness could demand. Japan's representative spoke almost wholly as a man and not as a diplomat; in response to a pertinent question he admitted that the Japanese people are probably resentful of the Pacific Coast's treatment of the Mikado's subjects, but drew an emphatic distinction between the attitude of the Japanese people and that of their government. He further asserted that the government was for peace, not on exaggerated grounds of amity, but because it was for the interest of Japan to keep the peace. Yet war the Mikado is bent upon, and war we are going to have, if the *Petite République* and other Paris papers know anything about it. It does not matter that the same French press is replete with accounts of Japan's marvellous activity in Korea and Manchuria, where, on the face of things, her interests should be enough to keep her from seeking foreign adventure elsewhere for years to come. If Japanese coolies come to Vancouver, they are formidable competitors. If they return to Japan, for reasons seemingly obvious to Vancouverites, it is because they are veterans, and the Mikado has recalled them with dire intent. Some day, educated Japanese will be reading interpretative books on "The Soul of the West," explaining why Americans refuse to believe the solemn assurances of the Emperor, foreign minister, Parliament, and diplomats of another nation, but do believe in patent medicines and Christian Science.

The announcement that the Marine Corps is recruited to its maximum strength, 8,700 men, and can accept no further applicants, is in startling contrast to the army, which was 20,178 short of its maximum on October 15, and is probably worse off to-day. The reason given for the success of the marines is the industrial depression; but this ought similarly to have affected the army. The causes, in our opinion, are deeper. In the first place, enlistment with the marines means an opportunity to see something of the world; and the navy is at present far better advertised than the army. Again, the discipline of the marines is much better than that of the army, which is torn by internal dissensions, and by dissatisfaction with the pay, and which has had many incompetent officers foisted upon it by the reorganization of 1901. The army is in politics; the marines are fortunately out of it. Whatever the latter's grievances, they are not publicly aired, officers are held to high standards of efficiency, and the corps makes a far better appearance whenever the two services are brought together, as in Cuba. In the marines there is a spirit which makes for soldierliness; in the army there is an indefinable something which is breeding unhappiness and discontent.

Europe is now temporarily frightening herself again with the "American Peril," or the "American Invasion." Not since Count Goluchowski unfolded its scaly horrors has that particular dragon received so much attention as during the past few weeks. At Paris an entire meeting of the Federation of Manufacturers and Merchants, which has a membership of some 4,000, was given up to a discussion of the crisis in America and its probable effects on Europe. Financial effects were, of course, primarily meant, but there was also an undercurrent of apprehension lest the depression in the United States should lead, as in 1893-95, to the "dumping" of a vast amount of American manufactures upon the defenceless shores of France. As a matter of fact, this has already begun, if we may credit trade reports. Both to maintain prices at home, and to make up for a slackened domestic demand, our protected manufacturers will be tempted to sell more goods abroad cheaper than ever before. Meanwhile, a good example of what American enterprise can do when it sets about it, is furnished by a series of articles in the *Westminster Gazette* describing how our beef exporters are gradually monopolizing the meat trade of England. Though present prices ought to give the English farmer a fair profit on cattle, there is a steady decline in the amount of English meat upon the market. Singularly enough, our dull cousins across the water ascribe our success in this matter to skill and organization, and wholly forget the tariff, from which all blessings flow—except when they don't.

To the majority of the German people the outcome of the second Harden trial will be almost a literal realization of justice as practised in the legendary kingdom where the verdict of guilty is followed by the dismissal of the accused and the imprisonment of the plaintiff. The sentencing of Maximilian Harden to four months' confinement in jail for criminal libel, after a lower court had decided in his favor on the same issues, will be taken by the world at large to mean that "high" influence was brought into play to minimize the impression of grave conditions in the German court and exalted military circles, produced by the writings in Harden's *Zukunft*. We do not mean to assert that pressure was brought to bear directly on the court: the administration of justice by the German tribunals has been generally regarded as above reproach. The testimony seems to have weighed against Harden. But when it is remembered that the testimony which counted against him was obtained by a startling reversal in the position taken by witnesses in the previous trial, the suspicion rises that in this direction pressure from on high had been exercised. An editor's going to jail is not a rare thing in Germany, and the editor of the *Zukunft* has every reason to believe that, in spite of his conviction, the effect of his revelations on the political and personal morality of a certain portion of the ruling classes will be a salutary one, while the bulk of the people will, we think, look upon him as a scapegoat rather than as an offender.

Italy has scarcely begun to settle down to the Nasi case when another political scandal involving maladministration and embezzlement comes to the front. The commission appointed to investigate the expenditure of the funds raised for the relief of the Calabrian sufferers in the earthquake of 1905 has presented a report laying bare corruption like the stealings from the Russian famine relief funds revealed last year. Of the sum of 40,000,000 lire ($8,000,000) contributed by the state and private charity, the great bulk has been wasted or misapplied. Money was distributed for political reasons, and the authorities were especially open-handed towards "sufferers" who were well off:

> The richer a man was, the more he received of charity, because his position enabled him to exercise pressure on his own behalf.

The tents for housing the real victims were given away in lots; one man received 120, another 30, and few homeless families got any tent at all. The commission publishes the names of twenty-five millionaires, among them a Senator and several noblemen, who received donations from the fund. It is hardly necessary to say that the Calabrian deputies have attacked the report on "patriotic" grounds, just as the Sicilians are attacking the prosecutors of ex-Minister Nasi. Other countries have been known to reveal similar symptoms of local patriotism in the case of prominent government-land grafters, and the like.

England is reported to be awakening to the seriousness of the problem of Asiatic immigration; yet every reason exists why the British public should have been awake for some years. In Australia, the question has long been a vital one. In the Transvaal, the crisis that has resulted from the refusal of thousands of Hindus to submit to the terms of the new registration act has been preparing for some time. Canada is only the latest and most conspicuous Imperial baby to cry out at the sight of the Oriental bogeyman. Still, Canada has to deal with a Power which, with all good will, has shown itself ready to insist on a decent degree of fairness for its subjects; and the practical British genius may be trusted to recognize the argument of facts. The case is different with the natives of India, whose natural protector is the British government itself; for the Hindus may bitterly complain that no class among them receives the protection due to it. Hindu coolies are not wanted in Canada, and Hindu traders are now being expelled from the Transvaal. Great, raw spaces like South Africa and Australia, with room seemingly for everybody for hundreds of years to come, are jealously guarded against the competition of the terrible brown man, whereas India, with a swarming population that has made the struggle for existence such a bitter one, is left open to the enterprise and ambition of the superior white man. In India, if anywhere, a tariff system that might build up native industries is conceivable; but such a measure would not be "thinking Imperially." On the other hand, when a small overflow of India's hungry millions seeks a living elsewhere under the British ægis, the colonies rise in fury against the threatened "competition."

When a newspaper that has been called, with such a show of reason, "the foremost journal of the world," changes hands, the event has its light to cast upon the whole drift of the age. That the proprietor of the London *Daily Express* should acquire the *Times*, is much as if the owner of the New York *Journal* should purchase the *Tribune*. All the protestations that might be made could not persuade the public that radical alterations of policy and of method would not ensue. Indeed, under the old control, the *Times* had suffered many unfortunate changes in recent years. Financial stress had led it into various questionable enterprises. Its credulous acceptance of the Pigott forgeries was a fearful blow to both pocket and repute. Of late years, it has too often pursued a malign policy in international affairs. It was almost as much responsible for the Boer war as it was for the war in the Crimea. Towards Germany, it has persistently followed a nagging and inflammatory course. For these and other reasons, its influence had visibly declined, yet it retained a prestige not equalled by that of any other newspaper in existence. It was, in the first place, the favored means of publicity for the leading men of the time. If Carlyle or Swinburne had a letter to write to any newspaper, it was certain to be sent to the *Times*. Furthermore, the columns of the *Times* were a sort of refuge for the oppressed of other nations. Manifestoes from Egypt and Bulgaria and Macedonia and Montenegro were regularly sent to it. But its supreme reputation was won by its unexampled corps of foreign correspondents. Its readers might feel sure that, if anything of importance happened anywhere, the *Times* would be certain to have a correspondent on the spot to telegraph an intelligent account. Blowitz was a sort of unaccredited ambassador to France, and let the *Times* into many a secret of diplomacy. His securing for it in advance a copy of the Treaty of Berlin was one of the most famous "scoops" of newspaper history.

Above and beyond all these titles to distinction, there was for years a quality in the *Times* which really gained for it the name of "The Thunderer." This was its ability to hit English public opinion between wind and water. When it spoke, its voice was really that of England. This did not mean that it set about shaping men's thoughts; it was rather assiduous in finding out what the average man's thoughts were, and then uttering them like a threatening Jove. This is not an exalted conception of the journalist's function—to lead by following; to give back to the public what it first gives to you; such a theory of the conduct of a newspaper may, however, lead to the appearance of extraordinary power. When an editor cries aloud what he has first heard ten thousand people saying, he is certain to appear a miracle of wisdom—to that ten thousand. The plan also has its embarrassments. Sometimes the *Times* found the popular oracles dumb, or mistook them. In 1880, for example, it misread the political signs, and was totally surprised by Gladstone's victory in the general elections. It is thus a sort of journalism not wholly admirable, not entirely consistent, not always successful, for which the London *Times* has stood all these years. But it was of a high type, admittedly; dignified and intelligent; and it is a melancholy reflection that the flashy and clamorous journalism has now pushed it to the wall. This concerns not merely the newspaper business. It shows which way popular taste is inclining. If every people has as good political representatives as it deserves, and as worthy priests, it certainly has as good newspapers. Just at present, England (to say nothing of other lands) seems to think that the newspapers she has had have been too good for her.

THE GOVERNOR IN THE MESSAGE.

At a time when the attention of the whole country is fixed upon the Governor of New York, in a degree unequalled since the days of Tilden and Cleveland, his annual message can but have unusual importance. It will be heard, not only by the State, but by the entire nation. And men will search it, not so much for particular measures, as for its revelation of the whole temper and attitude of the man who wrote it. People rightly infer that the way in which an executive deals with the affairs of a State is the surest earnest of the methods he would apply to national concerns. He that is faithful in that which is little will be found faithful in that which is much.

Scrutinizing Gov. Hughes's message from this point of view, men will find it illustrating his habit of absorbing himself in the business in hand. He is one who sticks to his job. Having, as he once phrased it, taken a retainer from the people of New York, he attends strictly to their business. If any one had imagined that the talk about Hughes as a Presidential candidate would lead him, as Governor, to produce some "views" for general consumption, a reading of the actual message will show how that would be to misjudge the man. It is a straightforward, unemotional, and thoroughly businesslike document, with no thought but of State affairs. There is not a word in it which a lawyer would call, in a Governor's message, *aliunde*.

More suggestive still is the progressive disclosure of the Governor's way of looking at public problems and searching out for evils their appropriate remedies. It is clear that he casts about, first of all, for some general principle. Having once grasped that, he proceeds to explain and enforce its necessary consequences. In his recommendations, whether about trust companies in the banking business, racetracks in the gambling business, ballot reform or primary reform, we can see that a principle is always operative in Mr. Hughes's mind. Equally visible is his steadiness of purpose. The quiet way in which he urges the widening of the scope of the Public Service Commissions, so as to bring the telephone and telegraph companies within their jurisdiction, is the best answer to those who assert that the Governor is a "reactionary." The difference between him and some men is that he can progress without yelling. One careful step after another is his method; and that he moves forward without clamor or abuse, does not alter the fact that he moves forward.

The most "sensational" part of the message is that relating to the racetracks. But it is sensational only in the meaning of being unexpected. Here, too, the treatment is throughout simply to apply the dry light of reason, and to appeal for essential justice. The principle from which the Governor proceeds is primarily legal. Here is an explicit provision in the Constitution, with its direction to the Legislature to pass laws against poolselling and bookmaking, so that they may be neither "authorized nor allowed within this State." On the other side, the Governor finds the tricky racing law which, while pretending to comply with the Constitution, nullifies it. This is wholly repugnant to the legal mind of the Governor. Without heat, and with only an incidental reference to the "demoralizing influences" and "economic waste" involved in the permission of public gambling, Mr. Hughes demands that the Legislature "carry out the clear direction of the people," and comply with the Constitution. The artificial discrimination between gambling on one side of a high fence and on the other, he declares to rest on "no distinction that is justified to the popular mind." Thus does the Governor put himself in the lead of a reform which is as much demanded on legal as on moral grounds. If the laws are not to be brought into contempt by indirection, and if thousands more are not to be tempted to their ruin by gamblers whom the Constitution outlaws, but whom the statutes practically license, then the Legislature must give heed to these recommendations of the Governor.

Turning to the other contentious parts of the message—those relating to a fairer and surer form of the ballot, and to greater freedom of the party primaries and party nominations—we find Gov. Hughes following the same path to his goal. In this case, his principle is simply that of democracy itself. All parties and all candidates should be given an equal chance, and no more, on the ballot; every voter should be free to choose the men he pleases for the different offices, and clearly to express his choice. Under our present ballot, these fundamentals are notoriously wanting; therefore, the Governor urges the simpler and more equitable form commonly known as the Massachusetts ballot. This is distasteful to machine politicians, but it is favored by ballot-reformers. By neither is Gov. Hughes apparently so much influenced as by his desire that the people be given the fullest expression of their wishes in elections. The same motive leads him to advocate primary reform and direct nominations. He would see the members of all parties protected by law from "despotic proceedings" in the name of party.

Gov. Hughes's second message could not, in the nature of the case, make so deep an impression as the first. But the two are of a piece. The later one shows that the qualities by the display of which the Governor burst upon the world a year ago as a man of first-class calibre, still animate him. Any State, any nation, is lucky that can command the services of a man so clear-headed, so forward-looking, so steadfast.

THE PROPOSED BANK LAW.

With the report of the State Superintendent of Banking, submitted to the Legislature January 1, and with Gov. Hughes's emphatic comments in his message of the same day, the question of the remodelling of the law which governs the New York banks and trust companies is now fairly before the public. In these two documents the salient points of the problem are presented with a clearness and force which make possible a grasp of the issue, even by the citizen unfamiliar with the intricacies of banking.

Superintendent Williams thus introduces his discussion:

> In my judgment nothing will meet the situation with fairness to the interests of the banks, of the trust companies, and of the public which deal with both, which does not require that each distinct field of operation should carefully be delimited and that any corporation transacting business in a particular field shall be subject to the obligations and restrictions which pertain to that field. Whatever reserves, or other restrictions, may be deemed advisable with reference to demand deposits in the case of a bank should be equally obligatory with reference to the same sort of deposits in the case of a trust company. Similarly, the savings bank business is a distinct field, and business of this sort should be transacted only by institutions subject to the restriction of the savings bank law.

Mr. Williams proposes, in the matter of banks that have opened "savings departments" which pay interest, and which, as the law now stands, are protected by no special safeguards beyond those imposed on ordinary commercial accounts, that "the investment of such deposits should be limited to securities approved for savings banks"; and he advises that the savings deposit business opened by business concerns, such as department stores, should be prohibited by law. Turning, then, to such trust companies as conduct a pure deposit banking business—that is, which receive deposits subject to check and repayable on demand—Mr. Williams advises that every trust company in a city of over 800,000 inhabitants shall "at all times have on hand a reserve fund equal to at least 15 per cent. of the aggregate of its deposits," and that the whole of this reserve shall be lawful money. But he makes the highly important stipulation that, in estimating the total deposits on which such reserves must be kept, there shall be excluded, first, deposits held in trust, "the disposition whereof is wholly within the control of the trust company as executor, administrator, etc."; and, second, "time deposits not payable within thirty days," and represented by certificates bearing such stipulation. This suggestion we regard as not only wise, but as essential to any comprehensive reform.

The deposits thus excepted represent the class of business with a view to which the present trust law was framed. Requirement, against such deposits, of the same cash reserve as against deposits repayable on demand and subject to such a run as that of last October, would be as manifestly unfair as to require maintenance of such a cash reserve by an individual executor or trustee. The Bankers' Committee, in our judgment, with the exception of A. S. Frissell, missed this point completely. In advising a 15 to 25 per cent. reserve on all deposits of the companies, the bankers proposed what appeared to us a distinct injustice to such institutions as have continued to do the old-fashioned "trust company business" and nothing else. Mr. Williams also urges the necessary imposition of severe penalties on any trust company officer who evades the "time deposit notice" by private agreement for repayment in advance of the certificate's maturity.

So far, good; there remain, however, one or two points on which the Banking Superintendent's plan fails, we think, to meet all needs. Glancing over the broad field in which trust companies may, under the law, invest demand deposits while banks may not, he advises restriction on the amount of funds which an institution may thus invest, but he would not forbid the use of demand deposits for such investment. Furthermore, while recommending a 15 per cent. cash reserve against such deposits in trust companies, he would increase the required reserve of State banks to 25 per cent., of which 10 per cent. may be placed with other institutions. This discrimination Mr. Williams bases on the statistics of actual exchange of checks, showing that such daily drafts on trust company deposits average only 7 per cent. of the similar drafts on banks. From this, he reasons that "a large proportion of the trust companies' deposits are inactive," and do not, therefore, require the maximum reserve. This inference we cannot accept, in so far as it applies to demand deposits. The safeguard of reserves and the restriction on investments are applied, not with a view to what depositors are doing every day, but to what they may do in a day of panic. In 99 per cent. of the days during which the banks do business, a nominal reserve and the widest permission for use of demand deposits would probably cause no trouble. It is such days as October 21 which the law must always keep in mind; and no law can meet the emergency unless it recognizes that the depositor's power to take out cash instanter, and not his presumed or customary *wish* to do so, is the root of danger.

Holding this belief, we regard the remarks of Gov. Hughes of the highest value:

> It was evidently the original legislative intent that the different classes of financial institutions should confine their public service to their own particular spheres. Lack of a clear differentiation between the functions of each class and confusion as to statutory limitations have prevented the holding of these institutions strictly within the original lines of their intended activity. As a result the encroachment of one upon the legitimate field of another has ensued. It was not the original legislative intent that the trust company should engage in commercial banking, trespassing upon the field of the bank of discount. It was not the original legislative intent that the bank of discount should engage in the business of a savings bank.

To us, this appears as not only sound finance, but as plain common-sense.

WALL STREET VINDICATED.

To avoid being classed with the malefactors, we begin by saying that we refer to Wall Street as an institution. With the dealings of individuals in Wall Street we are not here concerned. They may be as predatory as you please. Nor do we mean to speak of the wisdom or folly of the enterprises and speculations which have had their birth in the shadow of Wall Street. It is not a question of such operations being "vindicated": some of them never can be except by the disgrace and ruin of the operators. Putting all these things to one side, there remains that Wall Street which is, as Major Henry L. Higginson calls it in his *Atlantic* article, "The money shop of our country." And what we wish to do is to point out how convincingly the course of events during the past year has shown that this institution is still discharging accurately its old functions.

Wall Street has demonstrated again that it is the financial barometer of the nation. Of course, it often records fluctuations which have no meaning except a temporary one. There are sometimes flurries in the Street, corners and squeezes, manipulated prices, which signify no large change in the financial weather. This everybody understands. But when, during a long period, Wall Street is set foul, foul weather is certain. In other words, when the great finance of this country has thoroughly discounted a future event, that event is bound to come. This was disputed by foolish people all last spring and summer. Myopic optimists could not see the facts: in the steady depression of the stock market, they perceived only the machinations of wicked men. This was the view which the President took in his Provincetown speech. Into his ken, the real function of the money shop of the country had not at that time swum. And when the storm finally broke, there were multitudes whose first angry thought was to run and smash the barometer which had foretold its coming!

A knowledge of the truth has since been making its painful way. People have discovered, as Major Higginson says, that it is of no avail to call Wall Street "hard names." Whether we like the individuals connected with it or not, the thing they do, in their united capacity, is both useful and indispensable. They bring to bear upon trade and finance a collective judgment which is more valuable than that of any one banker, merchant, manufacturer, or any one group of business men. It is a judgment, too, backed by the hazard of great fortunes. Hundreds of men, with thousands of millions at stake, give their nights and days to the closest scrutiny of the widest facts obtainable, and their inference, after comparing notes and checking off data, must be nearer the truth than that of observers less skilled. It is the business of these men, thus equipped, to "make a market," in Bagehot's phrase; and when their deliberate opinion is that the market should be made continuously lower, the prophecy of slackening industry and a time of depression is almost infallible. At all events, it is the surest word of prophecy we have. During all the months before the October panic, Wall Street's indications of coming trouble were treated by many as only so many Cassandra warnings; but the prudent foresaw the evil and hid themselves—or their money.

Another way in which the hard fact has again put the uses of Wall Street beyond cavil, is in the proof that it still is the financial brain of the nation. That the West was at last financially independent of the East, we heard many asserting as the country entered into the penumbra of depression. Look at the vast agricultural and mining resources, consider the banking deposits, in the States bordering the Mississippi and beyond. How could a disturbance in Wall Street shake that solid structure of prosperity? This question was asked triumphantly in the West; and even in the East magazine editors were gravely appealing to financial writers for articles showing that Wall Street might go to the bow-wows without affecting the proud and independent West. Even in the panic week, the Chicago and St. Paul and Kansas City newspapers made light of the comic fright of Wall Street. New York banks might suspend, but just watch the great institutions of the West. Well, we did watch them, and saw them almost immediately fall into greater straits than our own. Any other result was, from the first, unthinkable. With capital now one of the most fluid things on earth, it was certain to go where capital was most sought and could be best employed. That place was Wall Street. To it, as Major Higginson writes, goes the man who would "build a railroad or factory, or open a mine." He comes to Wall Street to hunt for capital when he begins his enterprise, and he returns when he needs more to prosecute it. Consequently, if there is anywhere in the land money seeking investments, it responds, as quickly as the *jinn* to the rubbing of the ring, to a summons from the place where investments seek money. In fact, from $300,000,000 to $400,000,000 of Western money was in Wall Street all along. This is the main reason why it is folly to talk or the possibility of Wall Street's being dangerously ill while the rest of the country is in sound health. It is equivalent to saying that a man with a violent brain fever is fit to run a foot-race.

Wall Street has justly to bear the burden of many sins. That is one reason why it is popular to lay others wrongfully at its door. But leaving personalities and particular operations out of view, Wall Street may be thought of as a scientific instrument to measure financial movements. It is the province of science to predict; and in the presence of ample fulfilment, we cannot deny that the predictive function of Wall Street has once more been placed beyond dispute.

HILPRECHT AND HIS PREDECESSORS.

The Hilprecht case is before us again—this time through a resolution of the American Society of Biblical Literature and Exegesis, declaring that "charges reflecting on American-Oriental scholarship have been publicly made against Prof. Herman V. Hilprecht," and asking him for a "complete reply." This resolution but echoes that of the American Oriental Society. Professor Hilprecht, however, maintains a stubborn silence. We need not repeat here the details of the indictment; it is enough to say that he is accused of lying persistently in regard to his excavations at Nippur. He declared that he had personally discovered certain clay tablets (the so-called "Temple library"), which were in reality unearthed by Dr. John Henry Haynes, field director of the expedition of the University of Pennsylvania; and he gave this "Temple library" at Nippur as the source of certain tablets which had been purchased or discovered elsewhere; in fine, he had deliberately and elaborately falsified scientific records. The evidence in support of these charges has convinced the experts; and the simplest explanation of Professor Hilprecht's failure to clear himself is that he cannot.

This affair, extraordinary as it is both in motive and action, is not without precedent. We do not refer to the vulgar forgeries of literary and artistic wares, intended to empty the pockets of the unwary collector. To this sordid level Professor Hilprecht has not sunk. Nor are Ireland's spurious Shakespeare play, "Vortigern," Macpherson's Ossian, and Chatterton's Rowley poems quite in the same class with Hilprecht's tablets, though in each of these cases a not ignoble ambition for fame rather than mere money did, in part at least, prompt the deception. There is a closer resemblance to Solon's supposed forgery of a line in Homer's Catalogue of Ships, in order to prove that Salamis belonged to Athens; or Onomacritus's forgery of oracles of Musæus and Bacis; or such classical forgeries as the Letters of Phalaris. Professor Hilprecht, however, is not accused of manufacturing his tablets out of whole clay; we may liken him to a scholar who, in order to develop or sustain a pet theory in regard, say, to Menander, should declare that irrelevant fragments of papyrus found in Elephantine were parts of a play of Menander dug up at Ichgaou.

The most notable instance in point is probably that of John Payne Collier. The story, as told in the "Dictionary of National Biography," throws light, we think, on Professor Hilprecht's performance. Collier, like Hilprecht, was a scholar of indubitable attainment. In 1852 he announced in a letter to the London *Athenæum* that he had bought from a bookseller for thirty shillings a Second Folio of Shakespeare, 1632, annotated throughout in a hand of about the middle of the seventeenth century. On nearly every page were changes in punctuation, cancellings, stage directions, and textual emendations. In the same year, 1852, Collier printed "Notes and Emendations to the Plays of Shakespeare," said to include all the "essential" manuscript annotations. Then in 1853 Collier got out a one-volume edition of Shakespeare, with these anonymous corrections incorporated wholesale in the text, without a mark to distinguish them. These readings were attacked by such scholars as Dyce, Knight, Staunton, Halliwell, and C. W. Singer, but Collier's reply was that his critics were actuated by the meanest motives. Professor Hilprecht, we may note, denounces the proceedings against him as "cowardly." But to return to Collier—in 1854 he "discovered" his own long-lost shorthand notes of Coleridge's lectures on Shakespeare and Milton, delivered in 1811; and in 1856 he published the "Seven Lectures," together with interesting particulars of his early intercourse with Coleridge and Wordsworth. These "Lectures" were gravely suspect, but since they were professedly worked up from Collier's own notes, no complete proof of inaccuracy could be adduced. Finally, in 1858, Collier reached the climax of his career by issuing a six-volume edition of Shakespeare, in which he declared his conviction that his corrections "were made not from better manuscripts, still less from unknown printed copies, but from the recitations of actors."

Up to that time Collier's folio had never been submitted to experts. But some years earlier he had given it to the Duke of Devonshire, whose successor in 1859 turned it over to the British Museum for examination. At once the frauds appeared gross and palpable. The manuscript notes were seen to be recent fabrications, the seventeenth-century hand merely imitated. Indeed, many of the notes had been first written with modern pencil and then traced in ink. Collier contented himself with denying that he had written either the ink-notes or pencillings; but, like Professor Hilprecht, he refused to discuss the matter farther. The textual critics then analyzed his other work, and found out that a number of the Shakespearean documents published by Collier had been similarly doctored. A reference to Shakespeare, for example, had been inserted in one of the papers of Edward Alleyn, the actor. Indeed, it is now believed that a dozen different documents which Collier had personally discovered and published were purely the product of his imagination. His lengthy reply to these later accusations is described as "weak, disingenuous, and ineffective."

So much for the facts. No one theory wholly accounts for them. In general, his character was irreproachable: he was described by Lord Campbell as "a most honorable man." In his social relations, he was genial and kind-hearted. His labors as an historian of English literature, and particularly of the drama, had won for him an enviable reputation. But apparently he was not content with such fame as he might attain by fair means. He wished to eclipse every one in his own field, and to that end he sacrificed everything. He may have had an imagination which made it impossible to distinguish between truth and falsehood. Such an infirmity is not rare outside the realm of scholarship. But the writer in the "Dictionary of National Biography" believes that in literary matters Collier "was apparently devoid of conscience"; and that probably he had always thought of himself as living up to a motto from Milton prefixed to one of Collier's earlier works: "I have done in this nothing unworthy of an honest life and studies well employed." Professor Hilprecht also may be quite as conscious of his own rectitude.

"THE FORSAKEN MERMAN."

An interesting literary parallel is briefly presented in the London *Nation* of December 14 by L. I. (Louise Imogen?) Guiney—the likeness between Matthew Arnold's "Forsaken Merman" and "The Deceived Merman" in "Romantic Ballads Translated from the Danish" by George Borrow, London, 1826. The resemblances between this earlier work and Arnold's most popular poem are sufficiently striking to warrant reprinting Borrow's now generally inaccessible version:

THE DECEIVED MERMAN.

Fair Agnes alone on the seashore stood:
Then rose a Merman out of the flood.
"Now, Agnes, hear what I say to thee:
Wilt thou my leman consent to be?"
"Oh, freely that will I become!
If thou but take me beneath the foam."
He stopped her ears and he stopped her eyes,
And into the ocean he took his prize.
The Merman's leman was Agnes there:
She bore him sons and daughters fair.
One day by the cradle she sat and sang,
When heard she above how the Church bells rang.
She went to the Merman and kissed his brow:
"Once more to Church I would gladly go."
"And thou to Church once more shalt go!
But come to thy babes back here below."
He flung his arm her body round,
And he lifted her up into England's ground.
Fair Agnes in at the Church door stepped,
Behind her mother, who sorely wept.
"O Agnes, Agnes! daughter dear!
Where hast thou been this many a year?"
"Oh, I have been deep, deep under the sea,
And lived with the Merman in love and glee."
"And what for thy honor did he give thee,
When he made thee his leman beneath the sea?"
"He gave me silver, he gave me gold,
And sprigs of coral my hair to hold."
The Merman up to the Church door came.
His eyes they shone like a yellow flame;
His face was white, and his beard was green;
A fairer demon was never seen.
"Now, Agnes, Agnes! listen to me:
The babes are longing so after thee!"
"I cannot come yet: here must I stay
Until the priest shall have had his say."
And when the priest had had his say,
She thought with her mother at home to stay.
"O Agnes, Agnes! listen to me:
Thy babes are sorrowing after thee."
"Let them sorrow, and sorrow their fill;
But back to them never return I will."
"Think on them, Agnes, think on them all:
Think on the great one, think on the small!"
"Little, oh little care I for them all:
Or for the great one, or for the small!"
Oh, bitterly then did the Merman weep!
He hied him back to the foamy deep.
But often his shrieks and mournful cries
At midnight's hour from thence arise.

Arnold is so familiar that we need quote but a few lines:

——When down swung the sound of a far-off bell.
She sigh'd, she look'd up through the clear green
  sea;
She said: "I must go, for my kinsfolk pray
In the gray little church on the shore to-day.
'Twill be Easter-time in the world—ah me!
And I lose my poor soul, Merman, here with thee."
I said: "Go up, dear heart, through the waves;
Say thy prayer, and come back to the kind sea-
  caves!"
She smiled, she went up through the surf in the
  bay.
Children, dear, was it yesterday?

Legends of this sort, as the writer in the *Nation* notes, are common in literature:

> The mortal who marries a water-god, the neckan who is flouted by Christian children for having no soul, the sirens who bewitch the fishing-fleet, the merbaby who is washed ashore and buried among the graves of landsmen—these poetical traditions haunt every sea coast of the north.

The article closes with the question whether Arnold took this theme "from some fragment of oral or printed folk-song, from the 'Kiaempeviser' itself [the Danish collection on which Borrow has presumably drawn], or from a glimpse of the baldest page in dear George Borrow." As a partial answer to these inquiries, we venture to suggest a line of search which admirers of Arnold or of Borrow may be interested to follow.

The bibliography of the subject is found at page 360 of Vol. I. of Child's monumental collection of "English and Scottish Popular Ballads," Boston, 1882-1898. Professor Child there discusses the variants of "Hind Etin," a story which appears also under the title, "Young Akin" and "Young Hastings." In this Scottish version Lady Margaret, a king's daughter, hears a note in "Elmond's wood":

She loot the seam fa frae her side,
  And the needle to her tac,
And she is on to Elmond's wood
  As fast as she coud gae.

As she picks a nut, she is captured or captivated by Young Akin, who builds her a bower. There she lives till she has borne him six children; but finally she is seized by longing and goes home with the children:

But as they were at dinner set
  The boy asked a boun:
"I wish we were in the good church,
  For to get christendoun."

They accordingly go to church for christening. But the ballad ends happily; for they all, including Young Akin, stayed in the royal court,

And livd in mirth and glee.

In another version the lady dwelt with her lord in a "dungeon deep." In all these English versions, as Professor Child points out, the "fine romantic features, preserved in Norse and German ballads, have been quite effaced." In Scandinavia and Germany Hind Etin, or Young Akin, becomes a dwarf-king, an elf-king, a hill-king, or a merman. In the Danish "Agnes and the Merman," the woman has lived beneath the sea eight years and has seven children. While singing by the cradle one day, she hears the church-bells ring, and asks if she may go home. When the merman comes to the church for her, all the images turn their backs. He tells her the children are crying for her, but she refuses to return. They divide the children between them, cutting the odd one in half. In the German ballad, also, "Die schöne Agniese," the mother is moved by the bells to go back to church.

From this brief summary of points which Professor Child treats at length, it is evident that, though Borrow's translation might have given Arnold the idea of "The Forsaken Merman," the mere parallels prove nothing; for they run with the German ballad as well as with the Danish. The German, however, is probably better known, and is therefore more likely to have fallen under Arnold's eye; moreover, Arnold's biographers tell us that at the period when he wrote this poem he had been studying French and German. But whatever his source, some of the finest passages in the poem are exclusively his own. The descriptions are a purely modern addition—notably the often quoted lines beginning:

Sand-strewn caverns cool and deep,
Where the winds are all asleep;
Where the spent lights quiver and gleam.
Where the salt weed sways in the stream.

And again:

But, children, at midnight,
  When soft the winds blow,
When clear falls the moonlight,
  When spring-tides are low;
When sweet airs come seaward
From heaths starred with broom—

In touches like these and in the delicately portrayed pathos of the merman we have the crudeness and even brutality of the ancient legend refined and sublimated; we have a vision of that eternal conflict called human life; we have that alliance between feeling and thought which Arnold in one of his letters defined as the essence of "great poetry."

THE ASSOCIATIONS AT MADISON.

MADISON, Wis., December 31.

Aside from the social features, which were as manifold and enjoyable as ever, the meetings of the American Historical Association, American Economic Association, American Political Science Association, and American Sociological Society at Madison, Wis., December 27-31, were notable for the exceptional degree of scholarly and practical interest which attached to the majority of the papers and discussions. The combined programmes formed an imposing intellectual array; indeed, the very magnitude of the offering constitutes with some members an argument against too frequent joint sessions, notwithstanding the many points of contact between the fields of the several societies, and the professional interest of many teachers in more than one field.

This disadvantage aside, however, the fact remains that one could not easily fail to hear profitable talk. Of the four presidential addresses, that of Dr. J. Franklin Jameson of the Carnegie Institution of Washington before the Historical Association was easily first in importance. Under the title "The American Acta Sanctorum," Dr. Jameson called attention to the historical value of the lives of American ministers, missionaries, and priests, especially in the Colonial period and in the early West. Scattered, often, in little-known books and pamphlets, and cumbered with a vast deal of negligible chaff and vain repetition, there is nevertheless to be gleaned from this class of literature material of primary value relating to the social, economic, and religious life of our American communities. The literary manner of the address was as admirable as its matter. Frederick N. Judson of St. Louis, president of the Political Science Association, spoke on "The Future of Representative Government," commenting particularly on the influence of a deteriorating citizenship on representative methods; while Prof. J. W. Jenks of Cornell, president of the Economic Association, discussed some of the principles of governmental control of business.

Discussion in detail of even the most important papers among so many is, of course, out of the question. In the historical field, marked interest was aroused by a conference on the relation between geography and history, where the claims for "geographic control," as urged by Miss Ellen C. Semple of Louisville, Ky., and Prof. Orin G. Libby of the University of North Dakota, were sharply, though courteously, traversed by Prof. J. L. Burr of Cornell, who insisted that the power of man over nature was far the larger factor. It would be well if this question, just now a good deal under discussion by both historians and geographers, could be more fully threshed out. A session on European history brought out five noteworthy papers, the most striking, perhaps, being that of Roger B. Merriman of Harvard on "The Elizabethan Government and the English Catholics," in which some interesting evidence bearing on Walsingham's connection with a plan for a Catholic colony in America was presented. A morning was given to conferences on special fields of work, including mediæval and modern European history, Oriental history and politics, United States Constitutional history, and United States history since 1865. The last three evoked the greater interest. In the field of American economic history a paper by Alfred H. Stone, whose studies of the negro problem in the South have won him recognition as a foremost authority on the subject, was easily first in both general and scientific value. Mr. Stone also contributed to the proceedings of the Sociological Society a masterly paper on the topic, "Is Race Friction between Whites and Blacks in the United States Growing and Inevitable?" Among the younger scholars who concern themselves with recent history, opinion grows that the negro question comes near to being our gravest social problem, and that investigation of its racial and economic aspects must precede a rational treatment of its political side. If it be true that the negro is what he is partly because of slavery, it seems to be at least equally true that he was, and in some essentials still is, a slave largely because he is a negro.

Economics and political science naturally afford better occasion than history for the discussion of practical current topics, and the programmes this year made much of this class of material. The Political Science Association, for example, planned a session devoted to the South American republics, though only two of the four papers announced were given. The Hon. John Barrett, however, came nobly to the rescue, expanding a twenty-minute paper into a stump speech of nearly an hour. A valuable card catalogue of material relating to South America, in process of development by Hiram Bingham and now accessible at Yale, gave opportunity for a brief description of the possibilities of South American history and politics as a field for research. Another session of the same association, on the "Newer Institutional Forms of Democracy," treated such varied topics as the Massachusetts public opinion bills, recent primary election laws, and disputed points in primary election legislation. The important subject of colonial administration was represented by papers on the merits and defects of the present French colonial system, and inter-colonial preferential trade. Much of what was said, moreover, in the conference on Oriental history bore more or less directly on colonial affairs. Legal aspects of political science were accorded two full sessions, one on comparative legislation, the other on the administration of punitive justice. Under the former head was included an account by Charles McCarthy of the interesting legislative reference department of the Wisconsin State Library.

Neither the Economic nor the Sociological Association seems disposed to allow the practical to predominate wholly over the theoretical in the programmes. The theoretical question before the economists this year was, "Are Savings Income?" while the sociologists wrestled with such more or less abstract topics as "The Basis of Social Conflict," "Social Classes in the Light of Modern Sociological Theory" (the presidential address of Prof. Lester F. Ward of Brown), and "What Conflict Stimuli Are Active in Contacts between Orientals and Occidentals?" The subject before the Sociological Society which aroused the greatest interest, however, next to Mr. Stone's discussion of the negro, was the question, "Is Sectionalism in America Dying Away?" opened by Prof. F. J. Turner of Wisconsin. Professor Turner, who illustrated his argument by some interesting diagrams, contended that sectionalism, in its comprehensive sense, still flourished vigorously and showed few signs of disappearing. The debate which followed showed pronounced difference of opinion at the latter point, Prof. F. W. Blackmar of the University of Kansas voicing the opinion of many that sectionalism, though admittedly a condition to be reckoned with, was nevertheless on the wane.

The American Association for Labor Legislation, established in 1906 as a branch of the International Association for Labor Legislation, held its sessions at Madison this year, in one of them joining with the economists to hear the address of the president, Prof. Richard T. Ely of Wisconsin, and to discuss the normal work day in coal mines and workingmen's insurance in Illinois. The Mississippi Valley Historical Asociation, organized to facilitate co-operation between State and local historical societies in the Mississippi Valley, held several sessions; and there was also a conference, as last year, on the problems of historical societies.

The activities of the American Historical Association continue to gain strength and volume with the years. The Historical Manuscripts Commission has ready two volumes of the diplomatic archives of the republic of Texas, one of which will appear in the 1907 report of the association. The Public Archives Commission, in addition to its work on State and local archives, is continuing its supervision of transcripts of English documents for the Library of Congress, and will also make available the documents in England relating to the proceedings of colonial councils and assemblies. For new enterprises, there is a grant in aid of the transcription and printing by English hands of the entries in the Privy Council Registers relating to the colonies; a tentative plan for a series of prize essays, separate from the other publications of the association; and a commission to prepare a plan for the publication of historical material in the Federal archives at Washington. The Herbert B. Adams prize in European history was divided between E. B. Krehbiel, who wrote on the interdict, especially in the time of Innocent III., and W. S. Robertson, whose subject was Miranda and the revolutionizing of South America.

Next year the associations separate, the Economic Association, whose new president is Prof. S. N. Patten of the University of Pennsylvania, going to Atlantic City, while the Political Science Association, fortunate in the choice of Ambassador Bryce as its president, will meet in Richmond. The Historical Association, with Prof. George B. Adams of Yale as president, will meet at Washington and Richmond.

MEETING OF THE PHILOLOGICAL ASSOCIATION.

CHICAGO, December 30.

The Archæological Institute of America and the American Philological Association have completed their joint annual meetings, just as the scientists in much larger numbers appear upon the scene at the University of Chicago. Sessions began on Friday, December 27, and were so arranged as to avoid the usual conflicts—a notable improvement as compared with former years. There were the usual joint sessions, three in number, at the first of which the societies were welcomed by President H. P. Judson of the university, and were then addressed by the president of the Philological Association, Prof. Francis W. Kelsey of Michigan, on the question, "Is There a Science of Classical Philology?" At the second session, papers were read by Prof. Frank Bigelow Tarbell of Chicago, on the palm of victory, demonstrating the comparatively late emergence of the familiar symbol (fourth century B. C.); by Prof. George F. Moore of Harvard, on a valuable find of Aramaic papyri, as old as the fifth century B. C., at Assuan (Syene); by Prof. Frank Frost Abbott of Chicago on the theatre as a factor in Roman politics under the republic; by Prof. J. M. Manly of Chicago, on Chaucer's knight, and possible historical sources of his adventures; by Dr. Edgar L. Hewett, director of American antiquities, on the year's work in American archæology. The special feature of the third joint session was the lecture of the English archæologist, D. G. Hogarth, director of the Cretan Exploration Fund, on the early temples at Ephesus, with special reference to the third Diana temple of the sixth century B. C., which was of the same dimensions as the wonder-temple, except in height and expanse of steps. An account was also given of the large find of articles of jewelry in gold and electrum, coins, ivories, terra-cottas, etc., found in the centre of the oldest temple, and dating from about 700 B. C. It was proved that the art influences at Ephesus were Greek, and not Asiatic; that Artemis was not the later *Multimammia*, but, as a mother, the prototype of countless madonnas.

Both societies suffered by the absence of several prominent scholars, whose names appeared upon the programme. Death had taken Prof. Minton Warren of Harvard, and the illness and death of Prof. Seymour of Yale deprived the Archæological Institute of its president.

The Philological Association voted to reject the proposed constitution, which would have established local sections under the general society. Philology still refuses to be locally subdivided, in spite of hard times and costly journeyings. The association expressed its sympathetic interest in the movement in the Eastern States towards uniform college entrance requirements in the classics, expressed in identical terms, with announcement of the texts required in each of the next four or five years, after the method now made familiar by the Rhodes examinations. Prof. Francis W. Kelsey was elected president of the Archæological Institute and Prof. Mitchell Carroll of George Washington University, secretary. The new president of the Philological Association is Prof. Charles E. Bennett of Cornell. The next meeting of the two societies will be held in Toronto, Canada.

THOMAS DAY SEYMOUR.

The sudden death of Professor Seymour of New Haven, December 31, brings sadness to the hearts of all classical scholars in the land. During the twenty-seven years in which he nobly represented Greek letters at Yale he made himself familiarly known to every school and college in which Greek was studied. His sound scholarship, which was conspicuous in all that he said or wrote, and his absolute freedom from display of doubtful erudition, gained him universal respect.

He was born in 1848 in Hudson, Ohio, where his father, Nathan Perkins Seymour, was professor of Greek in the Western Reserve College. He was thus early inspired by that love of classical studies which governed his whole life. He took his bachelor's degree in 1870 at the Western Reserve, and afterwards studied at Berlin and Leipzig. He was professor of Greek at the Western Reserve from 1872 to 1880, when he was called to the chair of Greek at Yale, which he held until his death. He received the honorary degree of Doctor of Laws from the Western Reserve in 1894, from the University of Glasgow in 1901, and from Harvard University in 1906. He was president of the Archæological Institute of America, chairman of the Managing Committee and trustee of the American School of Classical Studies at Athens, associate fellow of the American Academy of Arts and Sciences in Massachusetts, honorary member of the Society for the Promotion of Hellenic Studies of London and of the Archæological Society of Athens.

We cannot attempt to mention all Professor Seymour's editions of Greek authors and other valuable contributions to classical learning, many of which appeared in the College Series of Greek Authors, of which he was coeditor with Profs. John Williams White and Lewis R. Packard. His little volume of "Selected Odes of Pindar" (1882), with excellent notes, first made Pindar easily accessible to our students. His most elaborate work, that on which his reputation as an author will undoubtedly rest, has just been published, "Life in the Homeric Age." This book (reviewed in the *Nation* of November 21, 1907, p. 472) is the fruit of many years of close and careful study of the Homeric poems and the traditions of the Homeric age, and its value to students of Homer can hardly be overestimated. His wise and careful method of dealing with disputed questions is perhaps best seen in his Introduction, especially where he discusses the present stage of the "Homeric Question." He thus states his general position (p. 13):

> At present, and for the chief questions before us, we are obliged to consider the Homeric poems as units, although we may hope that in secondary matters archæology will come to the help of philology in determining what passages are to be regarded as containing particularly ancient material, and what must be recognized as of comparatively late composition.

While he does not maintain that the Iliad and the Odyssey are "due to a single poet in the sense in which 'Paradise Lost' and 'Paradise Regained' are the work of John Milton," he still believes that a real poet, "whom we and the Greeks call Homer, used with absolute freedom the poetic material which he in common with other bards had inherited, and which had been gathering for generations by a process of gradual accretion, and that additions were made to the poem by his successors." He further says:

> The stamp of a great personality seems to lie upon each of the two poems. These poems have such unity as cannot be explained if they are the work of several poets.

Not many years ago this would have seemed to many an antiquated view of the matter. But Seymour fully appreciated the complete revolution in the whole Homeric Question which recent discoveries in Crete and other lands have made, carrying us back (in many points) to what was believed a hundred and fifty years ago, before Wolf's "Prolegomena" was written. He says (p. 35):

> No scholar would now set the Trojan War before the age of the palace of Cnosus, in which thousands of written documents are found. The art of writing was known, then, not merely in the poet's own age, but also in that of his warriors and his warriors' grandfathers.

Whatever view we may take of the disputed relationship of the Cretans, Egyptians, Mycenæans, and Achæans, there can be no doubt that alphabetic writing was well known in the Ægean lands long before the Homeric poems came into being. In Arthur Evans's circular, issued a few weeks ago, asking for help to finish his work in Crete, he declares that this work has carried back the date of alphabetic writing on Greek soil two thousand years. If all this had been known in Wolf's day, it is hardly conceivable that the famous "Prolegomena" would have been written. The further question of the relation of the Greek alphabet to these older forms of writing is the most important of those in which (in Seymour's words) "archæology will come to the aid of philology" in due course of time. Some ominous hints in this direction have already been given. Among the 174 characters which Mr. Evans has given us in print from the Cretan inscriptions, most of which are probably syllabic, there are ten or twelve which can easily be recognized as wonderfully like older Greek letters. And we must hope that some explanation may be given of the startling similarity to Greek letters of some twenty of the marks on pottery found by Petrie in the tombs of Abydos, of the first and twelfth Egyptian dynasties, which even the reduced "Berlin chronology" assigns to the years 3000 and 1789 B. C. and most Egyptologists place much earlier. Of these characters Petrie can now suggest only the cautious and unsatisfactory explanation:

> A great body of signs—a signary—was in use around the Mediterranean for several thousand years: whether these signs were ideographic or syllabic or alphabetic in the early stages we do not know; certainly they were alphabetic in the later stage.

He adds: "The history of the alphabet is as old as civilization."

Seymour's remarks on Homer must be read with an understanding of these discoveries and their new perplexing questions. Scholars are to be greatly congratulated that this valuable work was finished and published during the author's lifetime; and it is pleasant to remember that he himself lived to see the beautiful volume and to hear and read its well-merited praises. It will remain a lasting memorial of a scholar whose influence in the cause of learning has been great and will be enduring. The loss of such a man is a heavy blow to all who could appreciate his work; but it falls with far greater weight on those to whom he was endeared by friendship and affection. These feel that his early death has bereft them of what was an important part of their own lives.

W. W. GOODWIN.

Cambridge, Mass., January 2.

Among Professor Seymour's books may be mentioned: "Introduction to the Language and Verse of Homer," 1885; an edition of the Iliad, books i.-vi., 1887-90; "Introduction and Vocabulary to School Odyssey," 1897; and "Homeric Vocabulary," 1889. Professor Seymour was a highly valued contributor to the *Nation*, for which he reviewed many of the more important books on Homer and the Homeric age.

NEWS FOR BIBLIOPHILES.

While Longfellow was teaching at Bowdoin, he wrote to a friend that the best way to study a language thoroughly was to write a grammar of it; and in his early years he prepared a number of school books for use by his classes at the college. These books are now much sought after by collectors. His first effort was to translate the "Elements of French Grammar," by M. Lhomond, and to prepare a volume of "French Exercises" to accompany it. Both were printed in 1830 at the local press in Brunswick. Sometimes the two books were bound separately, sometimes in one volume, with the label "French Grammar and Exercises." The "Grammar" should have errata slips pasted in at pp. 34, 38, 60, 73, and 78. These slips were twice printed, the earlier in smaller type. The title-pages of these two books read simply "By an Instructer." In the second edition, 1831, this was altered to "By H. W. Longfellow, Professor of Modern Languages in Bowdoin College." After the "Grammar and Exercises" the next issue was the "Manuel de Proverbes Dramatiques," a collection of short plays chosen from a French work of similar title published in eight volumes, 1768-1782. The first plan was, evidently, to publish this selection in two volumes, and the earliest issue has "Tome I" on the label and contains 156 pages only. The second issue has the same title, but has 288 pages (the last misprinted 188). In the first printing the title of one of the sketches was misprinted "Diette" for "Diète"; and the types of a considerable part of the book were reset for the second issue. The next year, 1831, appeared "Le Ministre de Wakefield," Boston. This seems to have been merely a reprint of a Paris edition, and it is doubtful if Longfellow did more than select it as one volume of his Cours de Langue Française. A contemporary advertisement of this series announces the following issues:

Vol. I. Elements of French Grammar—With Notes and Exercises.
Vol. II. Le Ministre de Wakefield.
Vol. III. Proverbes Dramatiques.
Vol. IV. Selections in French Poetry.

The last was, apparently, never published.

Two text-books for his Italian classes, a "Syllabus de la Grammaire Italienne" and "Saggi de Novellieri Italiani," were published in 1832. The earliest copies of the Grammar have a misprint "la traité" in line 13 of the "Avertissement," p. [iii]. This page was reprinted and "la" corrected to "le." Longfellow prepared no grammar for his classes in Spanish (though from one of his letters it is known that he contemplated doing so). He did, however, prepare a reader, "Novelas Españolas," Griffin, Brunswick, 1830. The leaf "Al Lector" was twice printed. In the original form there are seven words in the last line; in the reprint two words only.

The above notes are, for the most part, made from the copies in the collection of the late J. C. Chamberlain. They will be more fully described in the Bibliography which Mrs. Chamberlain is having printed at the De Vinne Press. First editions and earliest issues in choice state are rare.

Hiersemann of Leipzig has just published a second and enlarged edition of Comte Émile de Budan's "Bibliographie des Ex-Libris," an octavo of 68 pages, with 34 reproductions. Two hundred copies only are printed for sale. The same publisher is about to issue a volume of Ex-Libris by Georges Hantz, director for twenty-three years of the Museum of Decorative Arts at Geneva, and himself an engraver. The volume will contain 25 plates on copper, and only 100 copies will be issued.

The Anderson Auction Company of this city will sell on January 8 and 9 the library of Lewis H. Brittin of Englewood, N. J. It is largely made up of books relating to the Indians and Western Americana, but includes also first editions of Dickens's "Memoirs of Grimaldi," 1838, with the plate "The Last Song," in the earliest state; Gray's "Poems," 1768; and Lowell's "Fable for Critics," 1848. The series of publications of the Bibliophile Society is the longest ever offered at auction; and besides the André Journal, the Horace, and the Lamb Letters, it includes the two Thoreau volumes printed by the society from Mr. Bixby's manuscripts. On January 13, 14, and 15, the same company sells the library of H. F. Vories of New Orleans, including an unusual series of books on the French Revolution and the Napoleonic period, many in handsome bindings. In addition there are a few items of Americana, books illustrated by Cruikshank and Leech, and first editions of Dickens and Thackeray. On January 17 the same firm offers a collection of Civil War autographs, including a number of naval items.

On January 16, the Merwin-Clayton Sales Company of this city offers a miscellaneous collection, including a manuscript Book of Hours of the fifteenth century; a copy of the "Narrative of Col. Ethan Allen's Captivity," Boston, 1779; "Poems" of the Brontë Sisters, 1846, with Smith, Elder & Co.'s imprint; and first editions of Dickens's Christmas Books.

The second part of the library of the Duc d'Altemps will be sold at auction in Rome January 20 to February 10. The catalogue, describing 2,871 lots, fills 298 pages. Many early printed Italian books in their original bindings are included, among them a perfect copy of the Statutes of the City of Rome, first edition, printed at Rome by Ulrich Han about 1467; St. Bonaventure's "Meditatione sopra la passione del nostro Signore," Venice, about 1490; and the original Aldine edition of the famous "Hypnerotomachia Poliphili," 1599. Among the manuscripts is the earliest known copy of the Commentary on the "Divine Comedy" by Dante's son Pietro, 1359. The volume contains 134 leaves, of which the first six are on vellum, and the rest on paper. It is surmised that the first six leaves are in the author's own autograph. At the end of the catalogue, sold as the property of a Roman lady, is a copy of the Dante of 1564, printed by the Sessas, with 250 pretty drawings on the margins by an artist of ability, and many marginal notes which are attributed to Tasso.

At the book auction held by Sotheby, Wilkinson & Hodge, London, in the week ending December 14, the following prices were paid: Book of Hours, illuminated, vellum, 32 miniatures, fifteenth century, £40; another, French, 25 miniatures, £95; "Missale ad Usum Sarum," Paris, Regnault, 1527, Catherine of Aragon's copy, £44; Tylney Book of Hours, fourteenth century, £112; Hakluyt's "Virginia Richly Valued," 1609, poor copy, £31; Burton's "Anatomy of Melancholy," 1621, first edition, poor copy, £27 10s.; Peter Martyr's "Opera," 1511, £41; B. Mecom's "A Poem," 1757, first book printed in Antigua, £28 10s.; "Tristan de Leonnoys," Paris, 1533, £50; Burns's "Poems," Kilmarnock, 1786, poor copy, £118; second edition, Edinburgh, 1787, with autograph, £31; A. L. S. to his brother and two autograph songs, £88; two letters of Lord Nelson, 1796, £38 10s.; "Imitation of Christ," executed on vellum by the brothers Pape, 1850, £225; Shakespeare's Second Folio, 1632, £115; Poems, 1640, £260; eighteen autograph letters from Thackeray, Dickens, and others to Mrs. Gore, £116.

George H. Richmond, who announced recently that his experts had discovered that signatures in the so-called Milton Bible purchased by him at an auction in this city, were forged, has made public a letter from W. H. Buckler, secretary of the American Legation at Madrid and the latest owner of the book, ordering the auctioneer to release the purchaser from his contract. Mr. Buckler says:

> If the Bible is a forgery, the sooner it is exposed the better. If it is even seriously questioned by reputable experts its value is, of course, so greatly impaired that nobody could be expected to want it at any price.

This Bible is described in the *Nation* of December 12, p. 539.

Correspondence.

A NOTE ON "THE PLEASANT ART OF READING ALOUD."

TO THE EDITOR OF THE NATION:

SIR: The following extract, with its pleasant picture of domestic life in the early part of the seventeenth century, may serve as a note to your article in last week's *Nation* on "The Pleasant Art of Reading Aloud." It is from the dedicatory epistle to his father, prefixed by Henry More to his "Philosophical Poems," published in Cambridge, England, in 1647.

> You deserve the patronage of better poems than these, though you may lay a more proper claim to these than to any, you having from my childhood tuned mine ears to Spencer's rhymes, entertaining us on winter nights with that incomparable piece of his, "The Fairy Queen," a Poem as richly fraught with Divine Morality as Phancy.

C. E. N.

Cambridge, Mass., December 23.

HOFFMANN AND LONGFELLOW.

TO THE EDITOR OF THE NATION:

SIR: Prof. Robert H. Fife's letter, "The Real E. A. Hoffmann" (*Nation,* November 28), is interesting and instructive; he might have added a reference to Longfellow's introduction of the Hoffmann legend in his "Hyperion." In Book iv. ch. 3, "Shadows on the Wall," Hoffmann is introduced *à la* Hitzig; ch. iv., "Musical Sufferings of John Kreisler," is a pretty literal translation from Kreisleriana in Hoffmann's "Fantasiestücke in Callot's Manier." Prof. Gustav Gruener has helped me to a clearer perception of these facts. I write of them, not with a view to sharing, however slightly, in German literary research, but solely for the object of recalling the younger set of our scholars to a more careful consideration of Longfellow, especially of his "Hyperion." That curious medley of romance and autobiography was German literature for the ordinary American of the '40's and '50's. And most deservedly, for "Hyperion," despite its obvious faults, was a work of genius. It influenced the New England mind profoundly; it used to be a Harvard classic "before the war." In my judgment its influence was far more pervasive than that of Longfellow's other early writings; it set the fashion for German literature *of a certain kind.* Its very limitations explain to us the old-fashioned American ignorance of the greater German literature: Lessing, Goethe, and so on down to Heine. I hope that some one of our younger set may be moved to make a careful study of Longfellow's German studies.

J. M. HART.

Ithaca, N. Y., December 23.

MR. BERENSON'S "NORTH ITALIAN PAINTERS."

TO THE EDITOR OF THE NATION:

SIR: There is so little precedent for us bookworms turning that I venture reluctantly to question the adequacy of your notice of Bernhard Berenson's "The North

Italian Painters of the Renaissance" (*Nation*, December 5). I forbear to raise issues of opinion between your reviewer and a mere reader; our quarrel is on matters of fact. He writes: "At the end there are the usual tables of works by the artists considered in the text, etc." Now, in the first place, the works of twenty-four artists, not even mentioned in the text, much less "considered," are listed at the end. And next does the phrase "the usual tables" convey even to the average *Nation* reader that these tables contain practically all known works by the painters of the North Italian school, and that Mr. Berenson has not only located dozens of paintings personally and for the first time, but also has laboriously compiled these registers from obscure publications? Finally, does the statement that the attributions "will probably arouse the usual amount of discussion among experts" give any hint of the many ascriptions that will be accepted without discussion, as absolutely convincing? Possibly your reviewer assumes that the golden adjective "usual" applied to Mr. Berenson's connoisseurship tells all these things to most of your public. If so he takes a more hopeful view than do your critics usually, or than does your DEVOTED READER.

New York, December 26.

[Our review was unquestionably inadequate. The pressure on our columns at the time of publication made anything more than a cursory note impossible, unless the review was postponed until after the holidays. We may flatter ourselves too greatly in thinking that our readers have seen our former notices of Mr. Berenson's work. If they have they should know, approximately, what his "usual" tables are like. And "discussion" does not necessarily imply dissent, though it would be strange if there were not dissent also, the connoisseurship of painting not being as yet an exact science. By "the artists considered in the text" we meant the North Italian painters of the Renaissance. It might have been more exact to have said "the usual tables of works of the schools considered in the text." We hoped we had conveyed with sufficient clearness our sense of the difference between Mr. Berenson's writings and those of the "usual" purveyors of art-books for the holiday season.—ED. THE NATION.]

CONDITIONS OF FREE ACCESS TO ITALIAN MUSEUMS.

TO THE EDITOR OF THE NATION:

SIR: In consequence of a misconception prevalent among a large class of American travellers, attention should be called to the conditions under which the Italian government issues tickets, giving free access to national museums and excavations. It is not true, as stated recently in a publication distributed widely in America by a semi-philanthropic tourist association, that if a woman "has a diploma from an American university and sends it to the American consul in Rome, it will admit her to the art galleries of the state throughout Italy, free of charge." The law on this subject expressly limits such privileges, among foreigners, to artists; to students of the history of art and of artistic criticism who have brought out noteworthy publications (a copy of one such work is required); to professors of archæology, history, literature, and art; and to students actually matriculated in either Italian or foreign institutes of archæology, history or art, or of faculties of letters and philosophy or schools for engineers. Applications under each of these classifications must be accompanied by academic documents, visèd "by the Italian diplomatic agent or consuls in the country from which the applicant comes or by the ambassador of his country in Italy." Applications based solely upon "holding a diploma from an American university" are refused. H.

Rome, December 12.

NEW YORK'S UNWIELDY SCHOOL BOARD.

TO THE EDITOR OF THE NATION:

SIR: There is great need in New York city for the same efficiency in public educational administration which has revealed itself in Boston since the Boston School Committee three years ago was reduced from twenty-four to five. The question arises, Would not the concentration of power and responsibility involved in the same cutting-down process produce corresponding results here? I know of no more admirable summary of the arguments for such a change than "School Reform in Boston," a short and vigorous article in the July *Atlantic*, to which I would specially commend your readers. I have no idea of reproducing those points in this letter, but I beg to call attention to a few local considerations, in the hope that influential persons may take this matter up.

The same ratio of reduction as that applied in Boston would give us a board of nine or ten members, instead of forty-six, as at present. I fully believe that a board of this size, whether appointed or elected, paid or unpaid, would be far more efficient than the present board can possibly hope to be. This reduced number, however, would be still more efficient, if organized, as in the case of the Public Utilities Commission, in two distinct boards, or committees. Just as municipal problems are separated from State problems in the action of these two distinct small commissions, so I would separate secondary school problems from elementary school problems in their administration.

The tendency of the age is to divide education into three periods of six years each under the heads of elementary, secondary, and university training. University training is always controlled by a separate board; why should not secondary education be thus developed? The differences of subject-matter, method, and purpose are so great as to constitute distinct problems which can best be solved by separate groups of men. The youth is as distinct from the child as from the man, and his progress should be as carefully guarded. Before adolescence the child recites in each subject to one woman teacher; after twelve the youth recites in each subject to a different teacher, more and more commonly a man, and the object is differentiation not unification of studies. Self-government is instilled by college-bred teachers in the period of youth, while obedience is planted in childhood by the training-school graduate. Varieties of direction, speed, and general intensive suggestiveness are indicated by these and other distinctions which might be made between the scope, the method, and the purpose of secondary education and of elementary education. In conclusion, therefore, I submit that two small commissions or committees, of five men each, with full power and responsibility to manage respectively the first and second periods of six years each in school education, would prove a step forward in New York city.

ELRES.

Brooklyn, N. Y., January 3.

Notes.

A life of Thomas Chatterton has been written by Charles Edward Russell and will soon be published by Moffat, Yard & Co. Mr. Russell has a new thesis, that the so-called Rowley forgeries are the work of another hand than Chatterton's.

E. P. Dutton & Co. have ready for publication "A Pocket Full of Sixpences" by G. W. E. Russell, "With the Border Ruffians" by R. H. Williams, "The Life and Voyages of Joseph Wiggins," "English Children in the Olden Times" by Elizabeth Godfrey, and "Saint Catherine of Siena" by Edmund G. Gardner.

At the annual meeting of the Scottish Text Society, held recently at Edinburgh, it was reported that the concluding volume of Wyntoun will soon be issued; also the concluding volume of the text of Henryson is nearly ready, while the text of "John of Ireland" is making progress.

Archibald Constable & Co. will soon publish a work by Prof. J. Garstang of Liverpool on "Burial Customs in Ancient Egypt," being an account of excavations made during 1902-3-4 in the necropolis of Beni-Hassan. Professor Garstang's labors were discussed at some length in the *Nation* of October 31, 1907, p. 405.

The Literary Walloon Society of Liège has undertaken to publish a dictionary of the Walloon dialect, spoken in the provinces of Liège and Luxemburg.

A life of the late Baroness Burdett-Coutts is to be written by Charles Osborne.

Hereafter Moffat, Yard & Co. will be the American publishers of the *Burlington Magazine*.

The new *Theological Review*, edited by the faculty of divinity in Harvard University, makes its appearance as a quarterly, published by the Macmillan Company. The keynote of the periodical may properly be looked for in the introductory article by Prof. Francis G. Peabody, "The Call to Theology," with its hopeful utterance: "The period of indifference seems approaching its close, and an era of promise for theology seems to be at hand." Other articles, such as A. C. McGiffert's "Modern Ideas of God," T. N. Carver's "Economic Basis of the Problem of Evil," and C. F. Dole's "Divine Providence," carry out the impression that the aim of the magazine is to find a new justification of theology in the present results of scholarship.

The report that Dr. Prothero has given up the editorship of the *Quarterly Review* is now denied. He has merely handed over the control of the *Review* to J. C. Bailey for a time, owing to ill-health.

Further volumes of the World's Classics published by Henry Frowde contain Carlyle's "Life of John Sterling," Anne Brontë's "Agnes Grey," Lesage's "Gil Blas," translated by Smollett; "The Poems of Coleridge," and Trollope's "Three Clerks." Several of these have excellent introductions. To the Coleridge, for instance, A. T. Quiller-Couch contributes a brief life of the poet and study of his work. We observe that the editor, who writes of Coleridge with even more than the usual enthusiasm, has the courage to say that "there are some to whom 'Christabel' rings false, painfully false, here and there, in spite of its witchery."

We take pleasure in recording the appearance of the fifth volume of Beaumont & Fletcher, edited for the Cambridge English Classics (G. P. Putman's Sons), by Prof. A. R. Waller. The plays included are "A Wife for a Month," "The Lovers' Progress," "The Pilgrim," "The Captain," and "The Prophetess." As in the earlier volumes, the text is a literal reproduction from the folio of 1679, with a record of variant readings.

Houghton, Mifflin & Co. have added to their limited editions, printed at the Riverside Press, with large type and on fine paper, Sir Thomas Browne's "Hydriotaphia or Urne-Buriall." The text follows that of the first edition, 1658, and rectifies errors which have crept into later issues. The archaic spelling of the first edition has been retained, "save for a few deviations toward uniformity." The number of copies is 385; the binding is full red leather, with abundant gilt tooling. Altogether this is a worthy reproduction of one of the stateliest pieces of composition in our tongue.

A call has come already for a second edition of Dr. J. E. Sandys's "History of Classical Scholarship" (Putnam's) and the author has taken this occasion to make some changes in the form of his work and to add some twenty-eight pages of new matter. It is agreeable to hear that a continuation of this history, bringing the record down from the end of the Middle Ages (when the first volume closes) to the present day, is now in the press.

W. A. Butterfield has published a facsimile of Henry Pelham's "Plan of Boston in New England with its Environs, including Milton, Dorchester, Roxbury, Brookline, Cambridge, Charlestown, parts of Malden and Chelsea, with the military works constructed in the years 1775 and 1776." This large map, made under the authority of J. Urquhart, Mayor of Boston, and dedicated to Lord George Germain, is of the first importance historically.

The ninth volume of Worthington C. Ford's edition of the "Journals of the Continental Congress" (Government Printing Office), covering the period from October 3, 1777, to the end of the year, finds the Congress sitting at Yorktown, Pa. The most notable work of these three months was the adoption of the Articles of Confederation, the ratification of which by the States, however, was to be delayed for more than three years. The surrender of Burgoyne brought much business, including a tedious wrangle over the execution of the terms of the capitulation. Thanks were voted to Gates, Lincoln, and Arnold, followed immediately, however, by resolutions regarding Gates's movements which came near to ignoring Washington's authority as commander-in-chief. There was renewed hope of winning Canada, for on November 29 the Articles of Confederation were ordered translated into French, and circulated there, together with an address to the people; while three days later an elaborate plan for the enlistment of Canadians was submitted. On October 17 a board of war was established. The Continental paper money was no longer a sufficient resource, and on November 22 the policy of requisitions was entered upon with a call on the States for $5,000,000, to be raised in taxes, the issue of State paper money to cease. The futile attempt to regulate prices took form in the recommendation that commissioners meet at New Haven, Fredericksburg, and Charleston to deal with the matter. On the twenty-seventh of November the confiscation of loyalist property by the States, and the investment of the proceeds in loan office certificates, was recommended, followed within a week by the authorization of a loan of two million sterling from France and Spain. In October, John Hancock, president of Congress since May 24, 1775, resigned, his successor being Henry Laurens of South Carolina. A resolution of thanks to the retiring president encountered considerable opposition, but was finally voted. Mr. Ford's notes continue to be informing, and there is a useful list of committees, besides the usual index to the journal for the year.

"Lincoln in the Telegraph Office," by David H. Bates (The Century Co.), is an entertaining book of reminiscence in a comparatively unfamiliar field. While Mr. Bates does not pretend to go much beyond his own personal experience as manager of the War Department telegraph office and cipher operator from 1861 to 1866, his personal contact with Lincoln, who spent long hours in the office, was exceptionally close, and the pleasantly written story traverses a good many interesting incidents. Specially important, perhaps, are the author's firsthand accounts of how the military supervisor of telegrams, Edward S. Sanford struck out from McClellan's famous dispatch of June 28, 1862, to Stanton, the paragraph containing the words, "You have done your best to sacrifice this army," before delivering it; of the feverish efforts of the War Department to discover the source of the bogus proclamation of May 17, 1864, calling for 400,000 men; and of the plot to burn New York. These general matters, indeed, predominate over those relating specially to Lincoln, of whose personality Mr. Bates gives, however, many illustrations confirmatory of the general estimate long since formed by those who knew him. The proofreader should have prevented the repetition, on pages 86 and 87, of two paragraphs already printed on pages 28 and 29.

The history of "The Twenty-fourth Regiment, Massachusetts Volunteers, 1861-1866," by Alfred S. Roe, recently published by the regimental Veteran Association, Worcester, is a valuable contribution to the literature of the civil war. Its term of service was longer than that of any other Massachusetts regiment but one; its operations in some six States included the Burnside expedition to North Carolina, the assault on Fort Wagner and the siege of Charleston, and the campaign on the James. The aim of the work is not to give an historical account of the events in which the regiment took part, but simply to tell what the officers and men "saw, said, thought, and, above all, did." Consequently the book is full of personal incidents and anecdotes, many of which are amusing and give graphic pictures of soldier life and humor. The largest contributor is Gen. Francis A. Osborn, the original lieutenant-colonel, who kept a diary of the daily happenings during his term of service. There are numerous portraits and pictures, including scenes in camp and on battle field by members of the regiment, as well as maps and a roster.

There is but one honest thing to say about G. S. Layard's "Shirley Brooks of Punch" (Henry Holt & Co.)—it is at least three times too long, an exaggerated example of the dropsy that has laid hold of English biography of late years. Shirley (his real name was Charles Williams) Brooks was born April 29, 1815, and lived until 1874. He was from an early age a voluminous contributor to the press, besides writing a number of novels, now as completely forgotten as his leaders and critiques. He became a member of the *Punch* circle, and, after the death of Mark Lemon, in 1870, assumed the head of the table. He was a great talker of the old sort, sometimes getting himself up for a dinner-combat by an hour's deliberate meditation; a tremendous writer, turning out notes, jokes, poems, Parliamentary reports, any kind of "copy," with incredible ease—a born journalist. His letters are of the kind that must have filled the recipient with joy, but that somehow in cold print, half a century later, sound forced and schoolboyish. They should never have been published. The most human note in the book is the pathetic account of his death:

> On the morning of the 23rd he looks over the forthcoming number of *Punch*, and makes some suggestions. A boy is waiting below for "copy." Shirley writes a small make-up paragraph, asks for a cigar, takes a couple of whiffs, "*looks very surprised*," and falls back dead.

The only information of any particular value is the determination of the fact that *Punch's* famous apology to this country after the death of Lincoln, was written, not by Brooks, who opposed the project, but by Tom Taylor.

Four of Vernon Lee's books have recently been published: By John Lane Co., "The Sentimental Traveller: Notes on Places," and second editions of "Genius Loci" and "Pope Jacynth and Other Fantastic Tales"; by Mitchell Kennerley, a little reprint of "Sister Benvenuta and the Christ Child." The stories are in Vernon Lee's familiar manner: the style studied and polished, at times precious, often delicately ironic; the setting, a monastery or a nunnery or a feudal castle; the characters, burning with zeal, say, for religion or art, conceived in a vein of high fantasy. These stories are not for the ordinary palate, but for those who have cultivated a taste for the romantic and exotic. This limitation lies also upon the two books of travel, which continue in the line of "The Enchanted Woods and Other Essays on the Genius of Places." Vernon Lee is nothing if not a connoisseur in art, music, and literature. She sees everything projected upon the background of wide reading and wide seeing. Her allusions, her figures of speech, are suggested by books and pictures. "Genius Loci" is full of uncommonly clever description and happy observation. "The Sentimental Traveller" is the same thing, though a little less fresh and spontaneous. The reader carries away the feeling that the author's note-books were skimmed of their best for the earlier books, and that this is a sweeping up of unconsidered trifles. The descriptions are still admirably done; but there is a surfeit of them. The reflections are still those of a highly cultivated mind, but nothing new or moving. The countries included in the itinerary are Germany, Italy, France, and Switzerland. The quest of the Traveller is for "the enclosed places of the spirit, little regions of tender memories and peaceful hopes, set with wonder-trees, bearing deathless blossoms and fruit, . . . those vanishing, longed-for isles, those closed valleys, where the gold-dust of sunset lies tangibly on all things, and our own thoughts all wear an aureole." One of the most interesting papers, in which the writer's emotion is moved directly by the spectacle before her, not indirectly through its suggestions as to art and literature, is "The Chapel of the Sick Children at Berck." Were more of the pages in this tone, the total impression would be of sincerity rather than of sophistication and artifice; and the author would not be provoked to that despairing utterance at the end: "Of all vain dilettanteish writings, these essays of mine must therefore be the most dilettanteish and futile."

E. V. Lucas's "Character and Comedy" (The Macmillan Co.) freshly illustrates the sad truth that making books is too easy. Mr. Lucas has collected a number of light and agreeable essays from *Cornhill Magazine*, the *Outlook*, *T. P.'s Weekly*, the *Country Gentleman*, the *Academy*, and *Punch*. The best of them is "My Cousin the Bookbinder," a view of Charles Lamb as Mr. Lucas imagines the humorist would appear to that cousin, the bookbinder, "who is now with God." The last half of the book is made up of a series of amusing sketches, in epistolary form, from *Punch*: "Life's Little Difficulties." Each paper must have served its purpose admirably as a contribution to journalism; but as a whole the articles are too thin to merit the dignity of permanent form.

Stopford A. Brooke's new "Studies in Poetry" (Putnam's) are a pretty thin gleaning. There is an essay on Blake, well enough, but giving no fresh light on that much-bewritten poet; Keats is treated at some length, and three papers deal with Shelley and the Shelley Society. But the best of the book is the essay on Scott, a fair and discriminating appreciation of his poetry. Dr. Brooke takes up Ruskin's thesis that Scott was sad and gives to it another turn. He was not sad because the age was sad, and he represented it, but because he was, in his poetry, at least, so completely out of touch with his own time. Dr. Brooke makes a sharp distinction between Scott's verse and his novels, which are free from sadness because here the author is in close harmony with his age. It would be difficult to carry such a distinction through. Ivanhoe is not sad, yet it is as antiquarian as any of the poems. More fruitful is Dr. Brooke's long discussion of the Celtic elements in Scott's genius, although he treads on quaking ground.

In bringing together the principal treatises and *loci* on "Theories of Style" from Plato to Frederic Harrison (The Macmillan Company), Prof. Lane Cooper has made a book useful at once for the classroom student and the professional writer. One may object to the exorbitant value given to Wackernagel by placing extracts from his "Vorlesungen" as an introduction to Plato and Aristotle, and one may feel that J. Addington Symonds's three essays on style should not be totally neglected in a book which has room for Frederic Harrison, but these are minor points. The whole of Longinus, in Havell's translation, is included, which will compensate for any omission; and there are chapters from Voltaire, Buffon, De Quincey, Schopenhauer, and others.

The aim of Miss Tereza Stratilesco in her "From Carpathian to Pindus" (Boston: John W. Luce & Co.) has been to show what the Rumanian nation is, and especially to describe "the genuine and most interesting part of it, the peasants." With this end in view, after a brief outline of history, she sets forth at length the peasant's relation to the soil (that is, the manner in which the land is held), to the state, and to foreigners. His home life and industries are described, together with his amusements and pastimes. Much space is also devoted to an account of his religious life, his social relations, and customs at births, christenings, weddings, and deaths. But the book is more than a mere record of historical, ethnological, and sociological facts in regard to the Rumanian. It is a treasure-house of folklore, legends, ballads, and songs, often with the music attached. All are interesting, and some are very amusing. One of them is about a Jew who "went once to heaven, and, taking the guardian angel unawares, walked into God's gardens. When the angel caught sight of him he tried all means to get him out, but in vain: the Jew maintained that he had as much right as anybody else to be there, as there was no entrance fee to be paid. St. Peter was called, and tried to reason the Jew out of Paradise, but with no greater success; neither could David or Solomon persuade him to leave heaven. But a little angel took a drum, and, standing outside of the wall of heaven, began to drum noisily. 'What is the matter?' was the general inquiry. 'An auction.' 'Oh, wait a moment,' the Jew ejaculated, 'I will bid!' and out he fled, and the doors were closed upon him." The book is written in excellent English, and its attractiveness is much increased by the sixty-three illustrations which enable one to realize vividly many of the conditions of peasant life. There are also two maps and an index.

A translation of a translation is not the most satisfactory medium through which to learn about an original, but perhaps it is better than nothing; and a first-hand translation "from the ancient royal Abyssinian manuscript 'The Glory of the Kings'" is not to be hoped for. This manuscript is said to contain one hundred and sixty-four folios of goatskin, written in the Geez dialect. After the battle of Magdala, in 1868, it was removed from the room in which Theodore, the Ethiopian King, had committed suicide, and taken to the British Museum. Upon request of King John it was returned in 1872, and was carefully secreted; but later it was placed in the hands of the translator at the direct command of King Menelik. No attempt is made to date the manuscript itself, or to assign a period to its original composition further than to call it very ancient. The English translation, recently published under the title "Magda, Queen of Sheba" (Funk & Wagnalls Co.), was made by Mrs. John Van Vorst from the French version of Hugues Le Roux, member of the Rouen Académie des belles lettres. It gives an account of the visit of the Queen of Sheba to the court of Solomon, with many details not hinted at in the Biblical narrative. Familiarity with the Hebrew Scriptures is shown in many passages, but only in such a way as to indicate that the work was a compilation made at a much later date, with the purpose of fortifying the claims of the reigning house of Ethiopia, whose descent is ascribed to Solomon and the queen. Their son grows to the likeness of the father, whom he visits. The attempt is made to retain him as king over Israel, but when he insists upon returning to his mother and to his own people, a large delegation of the sons of priests and princes is sent with him to be the nucleus of a theocracy in the South. These young men lament the separation not only from their parents, people, and native land, but from the "Ark of the Covenant," which is called "Sion" and is treated as a sort of fetich. So they steal the Ark and take it along. Their journey is magically swift, pursuit is vain, and their arrival is marked with pomp and the establishment of an extensive kingdom whose law is an abstract of the Mosaic code.

Who the editors of the new "autograph" edition of "Hoyle's Games" are does not appear, but the publishers, the McClure Company, have given the book an agreeable form, and it may be recommended as a useful reappearance of an old friend.

By order of the trustees the speeches given and letters of congratulation read at the "Memorial of the Celebration of the Carnegie Institute at Pittsburgh, Pa., April 11, 12, 13, 1907," have been printed in a handsome volume by the De Vinne Press.

The seventeenth volume of "Minerva" (1907-8) bears appropriately as frontispiece a portrait of Dr. Karl Trübner, founder and editor of the yearbook, who died June 2, 1907. The present issue has received more than the usual revision and is considerably increased in bulk. Lemcke & Buechner are the American agents of this indispensable dictionary of the academic world. From the same house comes the one hundred and forty-fifth annual issue of the "Almanach de Gotha," with its revised information in regard to the families of the *haute noblesse* and the governments of the world. We have again to acknowledge from the London publisher "Whitaker's Almanack" and "Whitaker's Peerage, Baronetage, Knightage, and Companionage" for the new year. The editor has succeeded in adding more information to volumes already highly compact.

A new pedagogical journal intended especially for young teachers is now being published twice a month by Gerdes und Hödel, (Pädagogische Verlagsbuchhandlung), of Berlin, entitled *Blätter für die Fortbildung des Lehrers und der Lehrerin* It is edited by Doctors W. Wolffgarten, G. Roth, Johannes Meyer, and Alfred Pottag.

"Einführung in das Gotische," by Dr. F. v. d. Leyen, University of Munich, constitutes one volume in the series, Handbücher des deutschen Unterrichts, edited by Adolf Matthias (Munich: C. H. Beck). It contains all the material needed for the beginner in Gothic—grammar, chrestomathy, and vocabulary. In the arrangement of matter the verb precedes the noun.

Ernst Eckstein's "Gesammelte Schulhumoresken" (New York: G. E. Stechert & Co.) contains not only his most famous sketch, "Der Besuch im Kerzer," but such other favorites as "Katheder und Schulbank," "Stimmungsbilder aus dem Gymnasium," together with several stories never before published. All the school world knows or should know the first-mentioned tale, one of those rare bits of dialect from school-boy life that breathes a language universal, whether it tells of mischievous and refractory pupils in the Rosegger forests or under the glances of an Ichabod Crane on the Hudson. What is interesting if not strange about Eckstein and his saucy lad is that the story has been condemned again and again, and indeed ever since it was written, by pedagogues and dominies; and still it has lived on, passing into edition after edition, chiefly, we suppose, because of the ever-present desire to read what the teacher has advised was pernicious. Taken as a whole, the book gives a fair idea of several sides of German school life.

Prof. Martin Hartmann of Berlin, who has recently returned from a long trip through Central Asia, will publish as one of the series known as Angewandte Geographie (Halle: Gebauer-Schmetscheke), "Kultur und Wirtschaftsgeographie Turkestans," chiefly on the basis of his own research. The work begins with a history of Turkestan. Another chapter is devoted to language and literature, furnishing among other things a large collection of popular poetry. Present economic conditions and possibilities of development in trade and traffic are to be fully discussed.

In the flood of new literature on Japan a noteworthy production is a work in German, "Die Kultur Japans" (Berlin: Curtius) by Dr. Daiji Itchikawa, lecturer in the Japanese department of the Oriental Seminary in Berlin. The book, which deals chiefly with the history and the present character of civilization in Japan, has something of the nature of an *apologia pro domo*. The author defends the imitation of Western civilization by modern Japan; but further declares that if Japan had not excluded Christianity in the seventeenth century and later, it would have shared the fate of India in becoming subject to Western peoples. He deplores the educational ideals that now prevail in the higher circles of Japan, compelling the acquisition of so many Western languages and literatures in addition to the native Japanese, and wonders how long the Japanese student will be able to stand the strain. Every Japanese student must acquire at least three foreign tongues, Chinese, English, and German. He tells us that the Japanese are naturally a religious people, and have already absorbed many elements of Christianity, and that the coming faith of the country will be a unique Japanese type of Christianity.

Under the title "Oestliches Werden," the well-known German essayist Dr. Hermann Brunnhofer publishes a series of articles the purpose of which is indicated by the sub-title: "Kulturaustausch und Handelsverkehr zwischen Orient und Occident von der Urzeit bis zur Gegenwart, (Bern: Victor Schlüter). These essays are chiefly historical, depicting the interchange of culture between the East and the West at different periods.

When the copyright on a German author's works expires, thirty years after death, the larger publishing houses compete in getting out good and cheap editions. Athenasius Grün, Simrock, and Freiligrath all died in 1876, and now their works have appeared in one of the best of these cheap series, Max Hesse's neue leipziger Klassiker-Ausgabe: Grün complete in ten parts, bound in two large volumes, cloth, 4 marks; the select works of Simrock, 12 parts in 4 volumes; and the entire works of Freiligrath, 10 parts, in 2 volumes, 6 marks. Literary introductions, and in some cases explanatory notes, accompany these editions, the texts of which have been critically prepared by recognized scholars. The Bibliographisches Institut of Leipzig and Vienna is publishing similar editions, known as Meyer's Klassiker-Ausgaben, the latest addition being Immermann's "Werke," with biography, in 5 volumes, at 2 marks per volume, edited by Dr. Harry Mayne.

A new journal intended to bring about an understanding between modern culture and religion is being published by Vanderhoeck & Ruprecht, Goettingen, entitled *Religion und Geisteskultur*. It is edited by Th. Steinmann. Among its contributors are leading theological and non-theological savants of different countries; naturally Germans are most largely represented.

Of the Corpus Reformatorum, Huldreich Zwingli's "Sämmtliche Werke," edited with the assistance of the Zwingli Verein of Zürich, by Profs. Emil Egli and Georg Finsler, and published by M. Heinsius of Leipzig, 14 *Lieferungen* of the proposed 120 which are to contain all the writings of the Swiss reformer have made their appearance. The editors have paid special attention to correct textual readings, and have added historical and bibliographical introductions and explanatory notes, chiefly linguistic. In many respects this will be a parallel to the great Kaiser edition of Luther's works, upon which the scholars of Germany have been engaged for more than two decades.

The old problem as to the relation of the doctrines of Jesus to those of the best Jewish teachers of his times, especially of Hillel, is being actively discussed in Germany. A small work lately published under the title "Christentum und Judentum, Parallelen" (a revision of a discussion originally printed in the Jahrbuch des Verbandes der Vereine für jüdische Geschichte und Literatur) offers an interesting set of parallels, particularly on ethical themes, between Christianity and Judaism. To show, however, that such parallels are merely an illustration of the old dictum: "Si duo faciunt idem, non est idem," is the purpose of Prof. Ed. Koenig of the University of Bonn in "Talmud und Neues Testament," an issue in the well-known series Biblische Zeit- und Streitfragen.

Prof. Friedrich Delitzsch of Berlin, whose lectures and pamphlets on "Babel und Bibel" caused such a stir a few years ago, recently delivered in Berlin under the auspices of the Lessinggesellschaft two popular lectures, "Weiterbildung der Religion," which promise to be equally sensational. He declares that the first purpose of the scientific investigation of religion must be to rid Christianity of elements from Oriental religions, chiefly Babylonian. He traces in the literature of Babylonia the beginnings of such *Beimischungen* as angelology and demonology, and the ideas of Jesus concerning hell, heaven, paradise, and the fall of man. Even the sacrificial idea in the Lord's Supper he traces to Babylonian sources, where, too, the Trinity is already important. Faith in miracles and in the miraculous healing of the sick is common to Oriental religions. Again, such conceptions as those connected with the birth of Jesus he traces back to a misunderstanding of the Old Testament passages, especially as these are reproduced in the Septuagint. The lectures will be published at once.

Prof. A. W. Hunzingen of Leipzig has written a new work on Christian apologetics, entitled "Zur apologetischen Aufgabe der Kirche der Gegenwart," published by A. Deichert, Leipzig. His attempt is to demonstrate that modern natural science, philosophy, and history have not damaged the Christian conception of things (Weltanschauung).

We had occasion to mention, some years ago, the appearance of the first (Danish) section of the "Palæographic Atlas," published in the year 1903 by the Arnamagnæan Commission through the Gyldendal Publishing Company of Copenhagen and Chicago. This publication, which is patterned mainly on the series of reproductions published by the English Palæographical Society, deserves more than a passing mention now that the second and third sections have appeared (in 1905 and 1907, respectively). The editor of this collection of reproductions of sample pages of old Scandinavian manuscripts and documents is Dr. Kr. Kaalund, librarian of the Arnamagnæan collection of manuscripts in the University library of Copenhagen. The first portfolio contains, on thirty-eight folio plates, a collection of sixty-four reproductions, chronologically arranged, from the twelfth to the sixteenth century; the second and third portfolios consist of thirty-seven plates each, containing fifty-three and fifty-seven reproductions, respectively, of old Norwegian and old Icelandic manuscripts. Opposite each phototype reproduction is a rendering of the text introduced with a brief description of the manuscript by the editor. The expenses of the publication of the last portfolio published have been defrayed by the so-called Carlsberg Fund, an endowment established for the promotion of science by the late Danish brewer Jacobsen. These reproductions testify to the high state of development which the art of writing, as well as that of illuminating, had attained in the Scandinavian North. Particularly deserving of mention in this respect are the Codex Frisianus of the Norwegian King's Sagas; the Flateyjarbók, which is probably the handsomest old Norse manuscript extant, containing among other things the earliest and best version of the discovery of Vinland; and some Norwegian law codices. The scientific importance of a publication like this needs hardly to be emphasized. A copy of this series ought, indeed, to be found in the library of every university where philological. and, particularly Germanic, studies are carried on. The editor's name is a sufficient guarantee of scientific thoroughness, and the mechanical part of the work does all possible honor to Danish bookmaking and reproductive art. The price of each portfolio is 30 crowns (about $8.00), to which must be added cost of carriage.

American scholars are more or less familiar with the work of the French universities in the study of English literature, but the remarkable progress of the French in Germanic studies has not received the same recognition here. No more pleasant introduction to a German classic could be desired than Paul Bastier's "Friedrich Hebbel, dramatiste et critique" (Paris: Larose), which contains, besides an interpretative introduction of two hundred pages, a free adaptation of Hebbel's chief play, "Maria Magdalena," and translations of his chief critical works. Hebbel's æsthetic theory is now attracting more and more attention in Germany; and though his name does not appear in Saintsbury's "History of Criticism," readers of this volume will readily recognize the unusual significance of his critical work.

In a few cities and villages in this and other States, some of them important, the proposition to turn the subscription library into a free library is persistently rejected. To abolish the fee, it is argued, would only cheapen the library and lower the esteem in which it is held even by those who are not willing to pay for use. As bearing on this question, statistics just reported by the public library of Olean, N. Y., are of interest. For many years this institution, under the name Forman Library, was maintained on the principle that if the public wished the use of it, the privilege could be had for a fee which any one could pay who was in earnest. Unlike many subscription libraries in small cities, it was maintained on a liberal scale, with an attractive building, good supplies of standard and new books, generous hours of opening, and was administered by librarians of skill and culture. Yet in a city of some 12,000 people, it had at the end of the year 1906 only 237 registered borrowers, and its monthly issue of books averaged only 716 volumes. About the middle of January last, without any important change in other respects, the fee was abolished and the library was made public. At the end of ten months, the list of borrowers had increased to 2,617 and the average monthly issue of books to 4,211 volumes, an eleven-fold gain in the number of borrowers and a six-fold gain in the number of books issued. The fact seems to be that the average man and woman are *not* greatly in earnest regarding the library. They can be moved out of their inertia and brought under the influence of good books only by removing all excuses for neglect and by supplying conditions that will appeal even to the indifferent and lethargic.

Special interest attaches this year to the report of the Royal Library of Berlin, both because liberal rules regarding the hours of opening and the use of the library have been recently introduced, and because it is the first report issued since the appointment of Prof. Adolf Harnack as chief librarian. The report shows a growth during the year of 32,979 volumes, of which 12,892 were added by purchase, 10,296 by gift, and 9,791 by deposit under the copyright law. Accessions deemed worthy of special mention are twenty-five incunabula and a collection of 1,600 volumes of modern drama and poetry. Of the incunabula the most noteworthy was a copy of the Fust-Schaeffer Psalter of 1459, costing 86,000 marks. The collection of German music, founded in April, 1906, by large donations from German music dealers, already contains 33,000 works; and the hope is expressed that eventually it will contain the works of every German composer. The reading-room was used during the year by 135,380 persons, 7,516 of whom were women; 367,300 volumes were issued for home reading, and 247,145 volumes were consulted at the library.

The midwinter meeting of the Bibliographical Society of America was held this year in connection with the annual meeting of the American Association for the Advancement of Science in Chicago, on January 1. The papers of the forenoon session were devoted to the bibliography of science. Dr. Cyrus Adler of Washington restated, with some new facts, the well-known story of the International Catalogue of Scientific Literature; A. L. Voge presented the case for the Concilium Bibliographicum in Zürich, treated this time from the point of view of the technical man; and W. A. Beale gave an account of "The Contributions of the United States Department of Agriculture to the Bibliography of Science." The last-named paper was a record of much creditable work done, while that from Zürich was chiefly concerned with plans for the future. On the suggestion of Dr. C. B. Davenport, the zoölogist, a motion was passed recommending the case of the Concilium and its appeal for funds to the consideration of the council of the society. It is proposed that funds collected in America be held in trust by an American board, soon to be created. In the evening the members of the society and their friends were the guests of the Caxton Club, in the rooms of which they listened to an illustrated lecture by W. D. Orcutt of the University Press, Cambridge, Mass., on "Printing as a Fine Art." The speaker dealt with the development of the type, its form, and its proportionate arrangement on the page, beginning with the scribe, here represented by the facsimile edition of the Breviarium Grimani, continuing through Gutenberg's forty-two-line Bible, and representative examples from the principal countries, down to William Morris, in whom the artist worked destruction to the purpose of the printer to present a readable page.

The Third International Congress for the History of Religions is to be held at Oxford September 15 to 18. The sections will deal with the following peoples and their religions: (1) the Lower Culture (including Mexico and Peru); (2) the Chinese and Japanese; (3) the Egyptians; (4) the Semites; (5) India and Iran; (6) Greeks and Romans; (7) Germans, Celts, and Slavs; (8) Christianity. English, French, German, and Italian will be recognized as official languages.

At the annual meeting of the Society of Biblical Literature and Exegesis, held last week at the University of Pennsylvania, Philadelphia, Prof. D. G. Lyon of Harvard announced that the Turkish government has granted to Harvard University a firman to explore the site of ancient Samaria, the modern Sebastie. The excavations are to be under the direction of Dr. G. A. Reisner, who expects to begin about April. This place is by many, if not most, Old Testament archæologists regarded as the most promising site for excavation in Palestine, provided always that funds are forthcoming to conduct the work on a sufficiently large scale, and for a sufficient period of time. On recommendation of the council the society took cognizance of the Hilprecht controversy, adopting the following preamble and resolution:

> Whereas, charges reflecting on American Oriental scholarship have been publicly made against Prof. H. V. Hilprecht,
>
> Resolved: That this society shares the desire expressed by a number of American Orientalists that a complete reply to these charges be made in the journal of this society or elsewhere.

The death is announced from Cambridge, England, of Gen. James John McLeod Innes, late of the Royal Engineers. He was born in India in 1830, and served through the Mutiny campaign. Among his books are "Lucknow and Oude in the Mutiny"; "The Sepoy Revolt," 1897; "Sir Henry Lawrence" (Rulers of India Series), 1898. He also edited a memoir of Gen. Sir J. Browne.

On the basis of a press dispatch announcing the death of Alfred Stead, son of W. T. Stead of London, a brief obituary note was printed in the *Nation* of December 19. Word now comes that the death is that of a brother of Alfred Stead.

THE CHARM OF VENICE.

Venice: Its Individual Growth from the Earliest Beginning to the Fall of the Republic. Part II. The Golden Age. By Pompeo Molmenti; translated by Horatio F. Brown. Illustrated. Chicago: A. C. McClurg & Co. 2 vols., $2.50 per vol.

The Sea Charm of Venice. By Stopford A. Brooke. New York: E. P. Dutton & Co. $1 net.

Venice on Foot. With the Itinerary of the Grand Canal and Several Direct Routes to Useful Places. By Hugh A. Douglas; 75 Illustrations and 11 Maps. New York: Imported by Charles Scribner's Sons.

Venetian Life. Revised and Enlarged. By William Dean Howells. 20 Illustrations in Color by Edmund H. Garrett. Boston: Houghton, Mifflin & Co.

The Old Venetian Palaces and Old Venetian Folk. By Thomas Okey; with 50 colored and other illustrations by Trevor Haddon. New York: E. P. Dutton & Co. $6 net.

The second section of Professor Molmenti's elaborate work deals with the sixteenth century—the climax of the magnificence of the

Republic, and the period which the world generally regards as most characteristically Venetian. Then flowered Venetian painting, then the architecture of the Renaissance began to run its riotous course, then pageants, luxury, and dissipation allured and amazed the pleasure-seekers of Christendom. But the historian knows that the Golden Age was really the age of decadence; and he measures the greatness of Venice by the many generations which were required before wealth and excesses finally sapped her vitality. Professor Molmenti describes this period more fully than it has ever been described before in English. The mass of material about it is almost endless; for, with the introduction of printing at the end of the fifteenth century, books and pamphlets were added to the usual store of public and private documents. Professor Molmenti explores every field—the political, the artistic, the social, the scientific, the educational. He naturally expatiates on the ceremonies and pageants, and he gives a dispassionate account of the judicial and criminal procedure which historical novelists have fastened upon for their lurid effects. In order to place Venice in the proper perspective, however, he should have stated what were the judicial methods and the tortures and punishments in vogue at this time elsewhere in Europe.

His chapter on the private life of the artists assembles many entertaining details, but it will be less novel to American readers (who may be presumed to have some acquaintance with the lives of Titian, Tintoret, and the rest) than his account of the authors and poets. He traces also the development of the drama, from the early mummeries to the beginnings of opera, in a fashion not elsewhere accessible in English. Since the "private life" is the central object of his study, we have very full descriptions of the daily habits of the rich and the poor, of the country-places of the former and the occupations and amusements of the latter, and of the customs attending birth, marriage, and death. A chapter on the type of Venetian beauty gives much curious information, which leads us to infer that beauty among the women was as rare in the sixteenth century as it is to-day. The few magnificent faces which survive in the portraits of Titian, Giorgioni, Palma Vecchio, Tintoret, and Bordone seem to be exceptions and not to belong to a widely diffused type. Professor Molmenti closes this section of his work with a study of the corruption of manners, a topic which has never been neglected by a certain class of investigators, but which he treats as an historian. Here again, it would be well to furnish some means for comparing the sexual license of Venice with that of other contemporary capitals: Rome, for instance, was rotten from top to bottom, and Naples reeked with all sorts of iniquity. Venice seems to have got the worst reputation because, like modern Paris, she advertised her licentiousness, instead of pretending to a decency which did not exist. Certainly, no apologist can deny the well-attested facts, which simply prove, in the last analysis, that wealth and luxury are the most dangerous enemies of a nation.

The admirable illustrations of these volumes have been chosen with such fine judgment that they really illustrate most of the subjects touched upon. Even specimens of Venetian lace are reproduced in half-tone. Horatio Brown's translation reads fluently, almost as if he had written it originally in English; but we must again express our surprise that he should leave untranslated many passages in mediæval Latin, Italian, and Venetian, besides many Venetian words and phrases, which most of his readers will find puzzling. It may be proper to quote authorities in the original for the footnotes; but such quotations in the text ought to be translated. The great number of works cited shows the range and minuteness of Professor Molmenti's researches.

Stopford A. Brooke's little volume contains an unusually good essay on "The Sea-Charm of Venice." In it he blends impressions and emotions, history and art. He is not the hasty tourist, who peers, and nods, and hurries on, but the lover of Venice, who has returned to her again and again, seen her under many aspects, thought upon her glories, and felt her fascination. He writes with genuine enthusiasm, but without gush, and displays also an unusual skill in description.

We have long wondered why no one has compiled a guide for those who wish to see Venice on foot, for that is the way by which, after you have made your first acquaintance with the canals by gondola, you can come to know the city best. Hugh A. Douglas has at last produced just such a book. It is a model of clearness, conciseness, and concrete information. In the course of ten walks, Mr. Hughes visits every part of the city. He describes also the Grand Canal, which must necessarily be viewed from the water, and the Place of St. Mark's. A map elucidates each walk, and numerous half-tones enable the stranger to identify the principal buildings. There is much miscellaneous information, packed into the smallest space. Moreover, Mr. Hughes has mapped out fifty direct routes, which show how to reach a desired point without delay. The book contains a list of noble families, and a section of general notes in which are treated such matters as the councils, the original citizens, the Tiepolo conspiracy, and the value of the ducat. Exhaustive indexes make it easy to find every name mentioned in the text. The book slips easily into the pocket, and ought to be the companion of every visitor to Venice.

It is more than forty years since Mr. Howells gathered into a volume his fugitive papers on Venetian life. They are still the best in their field; and now their author, having revised them, sends them forth in a definitive edition. He adds a pleasant introduction, telling why he has pruned or amended certain phrases or statements. That is, we feel, a dangerous pastime for an author of three score and ten to engage in. "The flourish set on youth" belongs to sketches of Venice written by an enthusiast of twenty-five. Suppose letters were to be toned down to suit the sobriety of the lover turned grandfather? But we would not insist too much in the case of Mr. Howells, for he has not really mutilated his classic volume, which may well delight another generation of readers. The publishers have brought out this *édition de luxe* in model form. Mr. Garrett's colored sketches are carefully reproduced, but they add little, in our opinion, to the charm of the book.

Mr. Okey turns his hand readily to almost any Italian subject, but he has never, we think, done so more successfully than in the present case. This book is not only much better intrinsically than his historical sketch of Venice, but it also is free from the pot-boiler aroma that pervaded that effort. He takes up chronologically the palaces of Venice, tells what is known about the building of each, describes (in many cases) the owners or dwellers, and surrounds each subject with its proper atmosphere of associations and traditions. He has had the happy inspiration to go direct to Malipiero, Priuli, and Sanudo for concrete examples of Venetian life in the fifteenth and sixteenth centuries; and, as he has excellent judgment in selecting and skill in presenting, he makes a varied, vivid, and trustworthy story. Those three great diarists did for their age much more than Pepys did for his; but Mr. Okey supplements their stories and their gossip with references to the professional historians, to Sansovino, the authority on customs and institutions, and to Tassini, learned in "Curiosities." Mr. Okey is a Ruskinian, yet he forms his own opinions on works of art, and does justice to the palaces of the later Renaissance which Ruskin condemned. But when justice has been done to those elephantine edifices—the Palazzi Grimani, Rezzonico, Manin, and Pesaro—one turns with a sigh of relief to the Gothic and Byzantine types in which is embodied the real Venice. Mr. Haddon's colored illustrations deserve high praise. Although here and there the colors may be too intense, yet the scenes are well chosen and the general color effects excel those of any similar book with which we are acquainted. The pen-and-ink sketches, drawn after the fashion of the architect's clerk, are better than similar work by Mr. Pennell, but they are at best less satisfactory than artistic half-tones. As a whole, the book is a delight, rich in the color, the glow, the gorgeous life of Venice.

CURRENT FICTION.

The Loves of Pelleas and Etarre. By Zona Gale. New York: The Macmillan Co.

The sentimentality of these idyls of old age is so effusive and unabashed as to discount in advance whatever reflections might be made upon it by the unemotional critic. There is something of the daring, of the *risqué* even, in such an exhibition of decrepit amorousness. That is a graceless way of putting it, and perhaps expresses too much. There is, let us say, a touch of indecorum in the unveiling of this belated dalliance; or would be if the spectator were not secretly aware that the whole affair is merely a piquant masquerade. These people are not really old, though they wear the garb of age. Supposing, however, it were possible for seventy to live and disport itself habitually in the mood of seventeen, you would suppose a Pelleas and Etarre. The fact that physically they are no longer as young as they used to be, would then be for them a matter of humorous and half-surprised recognition. They would dance, and picnic, and go upon endless honeymoons, always with their best foot forward, as these two charming old frauds delight one by doing. They would present, with a kind of defiant jauntiness, the spectacle of youth and crabbed age amicably dwelling together at very close quarters. Whatever extravagance, from a literal point of view, may inhere in these sketches, is at all events a very pleasant kind. No doubt there are a good many persons who have passed the threescore and ten, and who have their good moments of feeling themselves "seventy years young." Heaven forbid that any of us should find himself incapable at that age of some, at least, of the pretty follies which Pelleas and Etarre so gayly commit.

The Broken Road. By A. E. W. Mason. New York: Charles Scribner's Sons.

Americans have often read of those Indian princes who, sent to England to be educated in the English way, have distinguished themselves at Oxford and Cambridge, perhaps in scholarship, certainly in cricket and polo. "The Broken Road" is, in one sense, a sort of tract exhibiting the evils of this kind of training for the best class of Indian youth—the class of the native rulers. It is rather rare among Anglo-Indian novels in regarding the matter from the native point of view, as well as in its bearing upon British preëminence in India. The author's patriotism, however, sufficiently vindicates itself in the fact that the latter consideration is the chief one. The problem is expressed concretely: For generations the English policy has been to push a great highway through "Chiltistan" to "the foot of the Hindu-Kush." But on the part of the Chiltis there had been stubborn though secret opposition, which, in connection with the natural difficulties of the country, had delayed the execution of the project. The building of this road is understood to be essential to the establishment once for all of the British power upon the frontier. The plan had been originally conceived by an English engineer named Linforth, and had been carried forward by later Linforths, destined in one sense or other to lay down their lives for the project, without seeing its fulfilment. At the time when the story begins, the future of the road is seen to depend upon the new-born heir to "Chiltistan." The "political officer," who knows most about the frontier, and who is near his last days, urges that on no account shall the young prince be sent to England for his education. His plea is that in England the boy will be treated as an equal, while upon his return to India he must be treated as an inferior, the almost certain result being a desperate reaction on the part of the native against the government which insists upon his inferiority. Chief among the causes of his embitterment is likely to be a hopeless passion for some Englishwoman who has found it possible to dance and flirt with him in London, but could not possibly marry "a nigger." This prophecy is disregarded; the young prince is sent in due time to Eton and Oxford, where the latest Linforth becomes his closest friend. The two boys covenant solemnly for the building of the road. But the obstacle of the Englishwoman intervenes. The prince returns to India, already embittered, to find himself under the thumb of English officials. He reverts to his people, organizes a revolt, and the road, under the young Linforth, crushes him out of sight as it goes upon its predestined way. It is a moving story, well told. Perhaps the most striking thing about it to an American reader is the plain fact that the narrator, whatever his sympathy with the individual native victim, believes that the British power in India must be maintained at all cost.

Admiral's Light. By Henry Milner Rideout. Boston: Houghton, Mifflin & Co.

Mr. Rideout is making himself known as a writer of fiction whose work, though small in amount, is unusual in quality. Against his background of the New England coast village he is throwing a series of bold human figures such as it is the ordinary fashion of our story-writers to look for in Brittany or Cornwall. His themes are simple; he does not balk either the ugly or the heroic aspects of the life he is portraying. "Admiral's Light" is more picturesque, more amiably romantic than some of the earlier tales. It lacks the grim and really tragic force of such a story as his "Wild Justice," one of the most remarkable American short stories of its generation. "Admiral's Light" is an unfinished boy-and-girl romance, an apotheosis, one might rather rudely call it, of calf-love. The boy is a lighthouse-keeper, or, rather, does the work of one as self-appointed deputy for his aging grandfather. The girl is a foundling ward of a gypsy stroller. Their special virtue is that though circumstance throws them together and temptation is strong to seize the sweet of the passing hour, they are discreet enough to part, so that the boy may go away and find his place in the world. The persons and incidents which complicate this situation give one a little the impression of being contrived for the purpose. The increase of scale has perhaps been an embarrassment, as it is likely to be with the thumb-nail artists of the short story. And perhaps one's sense of a loss in directness and energy is corollary to one's impression of an increase of self-consciousness. Mr. Rideout's is a manner which in seeking distinction may become over-elaborate, meticulous, and ultimately barren. There is always danger that the well-bred style will become a mere polite murmur, sliding gently toward the ear, but not quite reaching it. And there is always danger that the literate style will become a creation of obvious artifice instead of a true vehicle. The chief thing we may wish of Mr. Rideout is more abandon, less attention to the rules of the game.

The Fair Lavinia and Others. By Mary E. Wilkins Freeman. New York: Harper & Bros.

This volume of tales may lead one to speculate as to whether it is for better or for worse that Mrs. Freeman is more frequently abandoning her stern New England portraiture for sentimental dallying with the past, for the production, as it were, of imitation miniatures. It is impossible to feel that she is adding anything distinctive to that literature of powder and patches, of lavender and old lace, which has been so thoroughly developed by our literary collectors of antique furniture. All the old properties are trotted out and put through their paces, with a result that would doubtless be called "pretty" and "sweet" by a certain type of reader. The persons use the queer lingo commonly foisted upon the eighteenth century hero and heroine: "She has no megrims, nor need to dose with salts, and the like, for swooning, like most of her sex." Glance at a page of Fielding, or Smollett, and contrast the vigorous talk with this kind of verbal "dandering." "I could love her not" is apparently the kind of locution by which one of these bogus antiques most readily convinces the general customer of its authenticity.

But if such a tale as "The Fair Lavinia" may be dismissed as sham, there are one or two stories in the collection which are altogether worthy of the author; hardly the graceful idyl "The Willow Ware," or the extravagantly romantic tale, "The Underling"; but stories like "The Pink Shawls," and "The Secret," with their simple and faithful realism. Altogether the most striking story in the group, however, is called "The Gold," a sombre study reminding one, as much by what it is not as by what it is, of Hawthorne. A soldier of the Revolution has set out for the war immediately after receiving a legacy in gold from England. He has hidden it, and has refused to tell his young wife where it is. After his departure she searches for it in vain. Noise of it gets abroad, leading to her murder by unknown hands. The soldier returns, to live alone the rest of his life, shunned by his fellow-villagers, since he is suspected of being in some way implicated in the murder of his wife, and of another person. One day he is found frozen to death with a letter in his hand which reads: "The andirons, the fire-set, the handles on the high-boy. . . . Gold." Hawthorne would have embroidered the grim fabric of this tale with an arabesque of symbolism. Mrs. Freeman tells it as if she had no curiosity whatever as to the spiritual experience involved in the fate of the wretched man. The plain narrative has a force of its own.

Bonaparte in Egypt and the Egyptians of To-day. By Haji A. Browne. New York: Charles Scribner's Sons. $3 net.

The title of this book, together with that of its author, arouses a delusive hope. At a moment when the East, Near and Far, is engrossing more and more attention, it is natural that men should turn more and more anxiously to the fundamental question: What is the inherent difference between the Western and the Eastern mind? An Englishman who has worshipped at Mecca appears as though he might be the Œdipus to solve the problem of the Sphinx. And there is something so inherently alluring in this notion of a fundamental problem with a possible solution, that even a case-hardened reviewer may, for a moment, fall victim to the Haji. But, after a careful examination of Haji Browne's book it appears clearly enough that he must be accounted only as one of the predecessors of Œdipus.

The internal evidence shows pretty clearly how the book is made up. Nearly three-quarters is a paraphrase of an Arabic chronicle recording the history of Bonaparte's expedition of 1798-99, plentifully seasoned with the somewhat vague commentary of the author. Long resident in the

Orient and a convert to Islam, Haji Browne's point of view is too personal to find a large audience, too heterogeneous to convince, and too discursive to please. His hold on fact is slight. He not only follows his Arab authorities into the most obvious errors, but presumably, owing to the failure of his authorities, he skims the period 1800-1898 in eighteen pages; yet that period saw the piercing of the Suez Canal—an event which profoundly affected the destinies of Egypt—and the creation by Mahomed Ali out of purely Oriental material of a highly effective military machine—a fact worth pondering at the present day. In the few pages devoted to Mahomed Ali one is most struck by the following remark, revealing as it does to the full the naïveté of the author's judgment. When the Pasha was carried to his rest not a few natives and some Europeans were moved to tears, which proves, according to our author, "that at bottom of all his sins and all his crimes the essential element of the man himself was good."

There is further ground of complaint against the Haji; his style is tedious; his egotism insistent. Thus he alludes to a speech of Beaconsfield in which that erratic but occasionally prophetic statesman drew a brilliant picture of the possible regeneration of Islam under the ægis of Britannia, only to point out that he himself, A. Browne, had previously placed the same opinions before an unappreciative world. "The imperial views of Lord Beaconsfield," he tells us, "were relegated to a pigeonhole, where, if the rats have not devoured them, they are still lying." We can no more picture the rats of the India Office devouring the views of Lord Beaconsfield than we can the public swallowing the opinions of Haji Browne. Clearly those opinions are not profound, not even original.

William Allingham, a Diary. Edited by H. Allingham and D. Radford. New York: The Macmillan Co. $3.75 net.

Before his death Allingham had begun to write out his autobiography, and the few completed pages dealing with his early life excite a regret that the work was not finished. He has left a charming picture of an imaginative child growing up with uncles and aunts in Ballyshannon, on the west coast of Ireland. But far the greater part of the present volume is made up from his diaries—hasty notes of the events and conversations of the day. A good deal of this is entirely trivial, and ought to have been suppressed. There would still be sufficient left to fill a fair-sized volume.

William Allingham was born in 1824. His schooling was brief. From the age of fifteen to twenty-two he was clerk in a bank, and from that time during the greater part of his life he held various offices in the customs service. In 1863 he was moved to a post at Lymington, which looked across the water to the Isle of Wight and Tennyson's home, about five miles away. During these years he was much at Farringford. He died in 1889.

The interest of the diary depends very little on Allingham's own literary achievements and much on the fame of his friends. It is evident that he was *persona grata* to the lions of the day, bestowing upon them just the right degree of respect to flatter their vanity without arousing their suspicion. His reverence, we hasten to add, was entirely creditable and showed not the least touch of subservience. The protagonists are easily Carlyle and Tennyson, but Rossetti and Browning come in now and then, not to mention a host of lesser names. Perhaps the most curious trait of the record is the fact that it shows us these men in very human attitudes, yet never lets us forget their greatness. Evidently Allingham knew how to draw the best from them in conversation. And how they talked about one another! At the very beginning we hear Leigh Hunt say that "Browning lives at Peckham, because no one else does! a horn poet, but loves contradictions. Shakespeare and Milton write plainly, the Sun and Moon write plainly, and why can't Browning?" On the whole the impression of Browning we get is not an alluring one. As characterized by others, and, more particularly, as he presents himself, he appears as a man of enormous activity and equally enormous vanity—something of a *poseur* withal. Perhaps the most significant of his own speeches is this, which may throw a good deal of light on the poet's persistent eccentricities:

> We ought to take up the hall at the furthest point to which it has been thrown. I should be sorry to think that any one was in advance in any way of me in my new Poem.

Columns might be quoted from the conversation of Carlyle and Tennyson, and from the account of their daily habits. How characteristic of Carlyle, for instance, that in crossing the most crowded thoroughfares he simply plunged in without pause, holding out a stick to poke into the nose of any horse that came too near. Tennyson is constantly reading his own verse. That is an old story, but Allingham has been remarkably successful in conveying to the reader the very tones and accents of the reader. We seem to be still nearer to him when we hear Coventry Patmore say: "When Tennyson finds anything in poetry that touches him—not pathos, but a happy line or epithet—the tears come into his eyes."

Not much is reported of politics, but "Dizzy," as all Allingham's circle called him, comes in for constant reprobation. One bit of conversation on that head is so remarkable that it cannot be passed over:

> Enter Sir John Simeon with Mr. Austin Bruce (M. P. for Merthyr-Tydvil). Sir J. presses me to go back to Swainston with him. I hesitate, then agree, and we walk off over the Downs. Dine at eight—they talk of Parliament behind the scenes: Dizzy often *vinosus*—one evening he spoke in such a state (keeping his legs with much difficulty) that Sir J. S. feared a public scandal, and was in pain for the credit of the House. (N. B.—Simeon is no scandal-monger.)

It is probable, nevertheless, that Sir John indulged in reckless scandal at this particular dinner.

Haiti: Her History and Her Detractors. By J. N. Léger. New York: Neale Publishing Co. $3.

Haiti, at last, has a champion who is entitled to be heard; for he speaks from fulness of knowledge, and from a position of political eminence sends forth no uncertain sound. It is not too much to say that the latest book on Haiti is also the best that has ever appeared respecting the so-called "Black Republic." Minister Léger has struck a new note, for, unlike others who have written on the subject, he places himself against a veritable wall of facts, and not only wards off the blows that are aimed at his country, but takes the aggressive against her critics. He relates the history of hitherto "unhappy" Haiti (and relates it well); he takes up the assertions of her "detractors," and ably refutes them one by one.

Now, of course, the chief offender is Sir Spencer St. John, whose "Black Republic" has done more than any other book to spread the impression that the government is a farce, and the people incapable of civilization. Sir Spencer, during his twelve years there, as minister resident and consul-general at Port au Prince, saw no light. On his title-page he quotes the exclamation of Napoleon III.: *Haïti, Haïti, pays de barbares;* and he repeats with evident relish a remark of his Spanish colleague: "*Mon ami*, if we could return to Haiti fifty years hence, we should find the negresses cooking their bananas on the site of these warehouses!" Well, nearly twenty years of those fifty have passed, and yet we find Haiti more prosperous, more certain of attaining its goal—which Minister Léger declares is the same as the white man's goal—and with stability more assured than ever before. How these things have come about, the talented author tells in his book, which all interested in Haiti's progress should read. He also shows how Haiti has, slowly and painfully, worked out her salvation; and—though through seas of blood, and sometimes with misguided pilots at the helm—brought the ship of state into a peaceful haven.

Sir Spencer St. John, and others (nearly all, in fact, who have written of Haiti in recent years) have repeated the tales of cannibalism and the voudou, so prevalent in Haiti; but Minister Léger declares that, while the negro mountaineers are, perhaps, given to superstition, and there may be *papa lois* and *maman lois* dwelling within the secret recesses of the hills, they never have descended to the gross barbarism of devouring human flesh. Sir Spencer gives facts and figures; Minister Léger gives figures and counterfacts: the one to prove the existence of cannibalism in Haiti, the other to disprove it. We are inclined, on the whole, to give credence to the minister.

Science.

Fortification: Its Past Achievements, Recent Development, and Future Progress. By Sir George Sydenham Clarke. New York: E. P. Dutton & Co. $4.50 net.

Fortification is a dry subject, dry even to most soldiers. It is, therefore, next to impossible to treat it interestingly. But this is just what Col. Sir George Clarke has succeeded in doing in this, the second, as well as in the first edition of his work, originally published in 1890. And the reason is clear; he has discovered, or stated, the human element in a subject heretofore supposed to be merely a matter of traverses and caponiers, of defilade and demi lune. Now let it be said here once for all that the human element has always been present; but it has somehow or other always yielded precedence to the material. No campaign, in the days when war was chronic, was respectable that did not involve a few sieges, generally in that classic land of sieges, Flanders. And thus the science or art of sieges, whether offensive or defensive, took high rank. The professors of the art were mighty and exalted, and untold sums of money were spent, with one almost invariable result: a place besieged nearly always fell. Nevertheless the bastioned trace dominated all military thought to such an extent, that even in our own land, our coast bristles with fine cut stone examples of it. One of them, Fort Trumbull, according to tradition, had been sandpapered on the outside to make it look smooth! So long did this influence last with us that it is within comparatively recent times that the profound study of the bastioned system ceased at the Military Academy. The cadets used to be told indeed that no more such forts would ever be built, and in particular that the Noizet front, the finest flower of the French school at Metz, which all had to draw, never had been and never would be constructed, that it was the mere academic limit of the possibilities of the trace in question; but, so great is the momentum of conservatism that every cadet addled his brain with its monstrosities and burned out his eyes with their projection on paper. To many of Sir George's readers, no passages of his work are more agreeable than those in which he pays his addresses to the engineering tyrants of helpless and innocent cadets.

The bastioned system got its first black eye, not from any disciple of the art in general, but from an officer of French cavalry, the Marquis de Montalembert. Driven out of court by a discussion lasting even to our own days, the place of this system was, in a moral sense, so to say, taken by steel and iron construction, by the disappearing turret, the steel casemate, the "pepper-pot" fort. These forms, too, are going out, for they are subject to the fundamental fallacy of all other systems, of the polygonal as well as of the bastioned, namely, that they become or tend to become the end, instead of the means to the end. In fact, it is largely in protest against this very error, costly almost beyond computation, that Sir George originally wrote his book. His dominant idea is that all fortification is necessarily controlled by the military conditions; that the soldier must prevail over the engineer pure and simple; in short, that to win in war, one must beat the hostile army. A moment's reflection shows that this precept at once puts fortification into its true place of subordination, and makes possible logical results, both in offence and in defence. It is no boasting on our part to say here that this precept, unconsciously perhaps, was put into practice by both sides in our own great war, and that the system of fortified defence developed at Petersburg in 1864 has become typical in our own day, even if it has as yet found no formal expression in the textbooks to the exclusion of other ideas. For what we then and elsewhere accomplished under the stress of war, contains at least the germ of what should be done everywhere in preparation for war, so long as this dreadful solution of international difficulties is suffered to exist.

The further investigation of this interesting question would be out of place here, but it is interesting to note that the whole body of doctrine laid before the world by Sir George excited the angry dismay of the Continental engineers. For Col.—then (1890) Major—Clarke uttered a protest, and in no uncertain tone, against the monstrosities of steel and iron put forward as the latest expression of military engineering skill. Indeed, the unconventional tone of the protest formed then, as it does now, an unusual charm. A work on fortification that raises a smile of delight is assuredly unique. But this was the insult that accompanied the injury, an injury none the less keen that it came, not from a heretic, but from an officer, himself an engineer, and, therefore, necessarily initiated into all the mysteries of the art. To the rest of us, however, the book came as an inspiration; and we hear very little now of the steel-cased hole in the ground covering a gun or two and worked by a few burrowing mechanics.

In his treatment of the great subject of coast defence, Sir George has naturally and properly kept in view the needs of the British Empire. Whether the conclusions reached are applicable in every other case, we are inclined to doubt. Like the tariff, coast defence is a local issue, and we believe that further study of our own conditions would lead to some modification of the views set forth in this book. In particular, the effect of mortar-fire is, in our opinion, underrated; similarly the advantages of submarine mines are minimized by what appears to us to savor of special pleading. The point of view is British.

We are heartily obliged to Col. Clarke for a second edition. A great part has been rewritten in the light of the experiences of the last fifteen years, and in every point the book is up to date. Apart from the special features on which we have briefly dwelt, it gives us pleasure to note in general the sane reasoning leading to sound conclusions. The appendices give complete and valuable data regarding the sieges in the chief European wars since the days of Marlborough. Another edition should correct the few misprints, especially in the French quotations. The work naturally appeals directly to the officer, and especially to the artilleryman and the engineer, but it should do more than this in helping to shape an intelligent public opinion.

This month Bowes & Bowes of Cambridge (England) issue a new edition of G. J. Gray's "Bibliography of the Works of Sir Isaac Newton." Many additions have been made, extending the work to twice its former size.

The Swedish scholar, Prof. Yngve Sjöstedt, who has recently returned from an expedition of zoölogical investigations in German East Africa, which he undertook with other scholars, under the direction of the Stockholm Academy of Sciences, will publish the results of his research, but in German. The title of his volume will be "Wissenschaftliche Ergebnisse der swedischen zoologischen Expedition nach dem Kilimandscharo, dem Marn und den umgebenden Massaisteppen in Deutsch-Ostafrica, 1905-1906."

The latest news of Sven Hedin comes in a dispatch from Calcutta, giving the points of a letter written from a place called Gargunsa, in November. In it he records that among other things he discovered the true source of the Brahmaputra River—namely, the Kubitsampo, which rises from an enormous glacier on the northern side of the northernmost parallel range of the Himalayas. The Mariumchu, which has hitherto been regarded as the source, is, he says, merely a small tributary flowing in from the west. After a careful study of the hydrographic problems regarding the Manasarowar and the Sutlej, Dr. Sven Hedin proceeded round the Troly Kailas, discovered the true source of the Indus, and travelled northeast to the thirty-second degree of latitude north.

John B. Francis Herreshoff will be awarded the first Perkin medal for achievements in applied chemistry at the January meeting of the New York Section of the Society of Chemical Industry. This medal was established a little more than a year ago, on the occasion of the visit to this country of Sir William Henry Perkin, whose discovery of mauve was the beginning of the coal-tar product industry. The first medal struck was presented to Sir William Perkin at a dinner in his honor. In the case of Mr. Herreshoff, the award will be made, not for any single achievement, but for his improvements in chemical processes, in roasting furnaces, and in other chemical machinery for the reduction of metals.

Charles Augustus Young, formerly professor of astronomy at Princeton, died at Hanover, N. H., January 4. His maternal grandfather, Ebenezer Adams, filled the chair of natural philosophy and astronomy at Dartmouth; his father, Ira Young, held the same position. He was born at Hanover in 1834, and was graduated from Dartmouth in 1853. He first taught at Phillips Academy, Andover, and then from 1857 to 1866 he was professor at Western Reserve. His work here was interrupted by four months of service in the civil war. In 1866 he came back to Dartmouth to the chair which his grandfather and his father had held; and in 1877 he became professor of astronomy at Princeton, where he remained till his retirement in 1905. In 1869 he had charge of spectroscopic observations of the solar eclipse at Burlington, Ia.; and on that occasion he discovered the green line of the coronal spectrum, and identified it with the line 1474 of the solar spectrum. At Jerez, Spain, in 1870, he discovered the "reversing layer" of the solar atmosphere, which produces a bright-line spectrum correlative to the ordinary dark-line spectrum of sunlight. In 1874 he was associated with Prof. J. E. Watson in the observation of the transit of Venus, at Peking, China; and in 1878 he was at the head of the Princeton astronomical expedition to observe the eclipse of that year. He was also in charge of the Princeton expedition to Wadesboro, N. C., to observe the total eclipse in May, 1900. Of his work in general it may be said that besides making a large number of new and important observations on solar prominences, he verified by experiment Doppler's principle as applied to light, by which he was enabled to measure the velocity of the sun's rotation. Among his inventions is an automatic spectroscope, which has been widely adopted. For his contributions to scientific knowledge he received in 1890 the Jannsen medal from the French Academy of Sciences. He was a foreign associate of the Royal Astronomical Society of Great Britain, honorary member of the British Association for the Advancement of Science, of the Manchester (England) Literary and Philosophical Society, of the Cambridge (England) Philosophical Society, of the Società degli Spettroscopisti Italiani; life member of the Astronomische Gesellschaft; a fellow of the National Academy of Sciences, an associate fellow of the American Academy of Arts and Sciences, Boston, a fellow of the American Philosophical Society, Philadelphia, and a fellow of the American Association for the Advancement of Science, of which he was president in 1883. He had also received honorary degrees from the University of Pennsylvania, Hamilton, Wesleyan, Columbia, New York University, Western Reserve, and Dartmouth. Professor Young was author of: "The Sun" (in the International Scientific Series), 1882; "A General Astronomy," 1889; "Elements of Astronomy," 1890; "Lessons in Astronomy," 1891, and a "Manual of Astronomy," 1902.

Dr. Nicholas Senn died in Chicago January 2. He was born in Switzerland in 1844 and came to this country with his parents in 1853. After graduation from the Harvard Medical College in 1868, he studied at Munich, and then began the practice of medicine at Fond du Lac, Wis. From 1874 to 1893 he was surgeon-general of Illinois, then moving to Chicago he became surgeon-general of the Illinois National Guard and surgeon at several of the Chicago hospitals. In the war with Spain he served as chief of the operating staff with the army in the field. Since 1884 he had held appointments in the Chicago medical schools: 1884-87, professor of surgery in the College of Physicians and Surgeons; 1887-90, professor of principles of surgery; 1890-1907, professor of practical and clinical surgery in Rush Medical College; professor of surgery in the Chicago Polyclinic; and professorial lecturer on military surgery in the University of Chicago. He was delegate to the International Medical Congress at Berlin in 1890; Moscow, 1897; and Madrid, 1903. Among his many books are "Four Months among the Surgeons of Europe," "Experimental Surgery," "Intestinal Surgery," "Surgical Bacteriology," "Principles of Surgery," "Pathology and Surgical Treatment of Tumors," "Tuberculosis of Bones and Joints," "Tuberculosis of the Genito-Urinary Organs," "Syllabus of Practice of Surgery," "Practical Surgery," "Surgical Notes on the Spanish-American War," "Medico-Surgical Aspects of the Spanish-American War," "Nurses' Guide for the Operating Room," "Around the World via Siberia," "Our National Recreation Parks," and "Around the World via India—a Medical Tour."

Dr. Robert William Taylor, a specialist in venereal and skin diseases, died in this city January 6. He was born in London in 1842, and was graduated from the New York College of Physicians and Surgeons. He was connected with various hospitals in this city; he had been professor of diseases of the skin in the Woman's Medical College of New York and in the medical department of the University of Vermont. He was author of "A Practical Treatise on Sexual Disorders of the Male and Female."

From Edinburgh the death is announced of two distinguished medical men: Thomas Annandale (born in 1838), professor of clinical surgery in the University, author of "Injuries and Diseases of Fingers and Toes," "Surgical Appliances and Minor Surgery," "Pathology and Operative Treatment of Hip-joint Diseases," and "On Diseases of the Breast"; and Sir Patrick Heron Watson (born 1832) assistant surgeon during the Crimean war, and, since 1855 fellow of the Royal College of Surgeons.

The University of Berlin has also lost a medical professor: Adelbert von Tohold, at the age of eighty, leading laryngologist of Germany, and inventor of many important surgical instruments.

Drama.

JAPAN'S NEW NATIONAL THEATRE.

Tokio, Japan, December 10.

The increasing influence of Occidental thought on the Japanese mind is nowhere so evident as in the nation's recent attitude towards the theatre. Historically Japan has presented the paradoxical spectacle of a people intensely prone to the dramatic element in every form, yet kept under by an aristocracy that despised everything that pertained to actors and acting. Virtually the Japanese are as much a race of actors as they are a generation of poets. As among them every habit of thought and turn of expression is flavored with delicate and subtle poetic fancy, so their prevalent ways of action exhibit something of the spectacular and the bizarre. But their histrionic potentialities have never been much encouraged. The only outlet in this direction has been the religious festivals and amusements, which in every village evince some taste for theatrical exhibitions, chiefly melodramatic and pantomimic. This persistence of the common people in their preference for histrionic methods of honoring the gods, has been in spite of an indifferent or disapproving upper class that for centuries continued to regard this form of entertainment as representative of a lower order of mind, and wholly out of sympathy with the more æsthetic diversions of abstruse games and poetic contests by which the gentry and nobles whiled away the monotony of the brief intervals of mediæval peace.

It is true, most of the old Japanese plays were so gruesome that the intelligence that failed to appreciate them might fairly be excused, were it not that these same non-playgoers never hesitated to enjoy in actual warfare what they pretended to despise on the stage. There was but one kind of play that a gentleman of old Japan could with good grace attend—the ancient classical drama known as the "No-Dance." It was given only on special occasions, and always privately, as a great man's treat to his intimate friends. To invite guests to appear in a public theatre would have been a gross violation of good manners. This prejudice against the public theatre had, however, a solid foundation; for actors and their companions were notoriously libidinous, and of the baser sort.

All this has now changed. Japanese actors may now indeed be said to compare favorably with those of other countries; and the leaders of Japanese society now frequent the theatre almost as much as do the common people. Recently even the Emperor himself has shown an interest in dramatic art. His Majesty has just issued an order for the erection of a new National Theatre in the Japanese capital, to be a model in architecture and equipment. To this end a commissioner has been sent abroad to study recent advances in theatre construction. Moreover, the leading lords and ladies of the empire have fallen in with the Imperial example. Nobles and magnates of every rank vie in manifesting an appreciation of the stage. The prime minister, Marquis Saionji, led the way by giving an official banquet to the leading members of the theatrical profession in Tokio, an event that stands alone in Nipponese history. How the shades of the neglected Danjuro must yearn to return from the realm of Nirvana, to contemplate even for a moment the revolution for which, during his checkered terrestrial career, he labored so hard. But the "Irving" of Nippon has gone, little honored and briefly sung.

The prime minister is very bold; he has gone a step further still, and advised the daughters of Danjuro, whom, it is said, give some promise of inheriting their father's talent, to go upon the stage. For a foreign mind to appreciate the significance of this move is difficult. The appearance of a real lady on the Japanese stage bears evidence to one of the profoundest mental and social changes that the empire has experienced in the last forty years. Hitherto, not only were respectable ladies debarred from attending the theatre, but no woman was permitted to act. The parts for women were always taken by men. Geishas, and others that had no reputation to lose, were the only members of the sex that ever essayed the rôle of entertainers.

That Japan can now produce dramatic talent hitherto latent is seen from the fact that what has been so long discouraged at home has yet found development and even appreciation abroad. Recently Madame Honoko, a remarkably brilliant Japanese woman, has been astonishing and delighting the French by her impersonations in a Japanese drama in the Theatre des Arts at Montmartre. In the opinion of most foreign critics, however, it will prove much easier for Japan to produce a theatre, perfect in appointment, than to furnish the talent for effective production of foreign masterpieces, as, according to rumor, the government plans. In many of our plays the motive would be pointless to the Japanese. Nor would an audience accustomed to some gory exhibition of human infamy readily take to drama calling into play wit, humor, and an appreciation of modern altruistic sentiment. But a people that can hear without wearying the intolerable length and monotony of their own plays, which go on ceaselessly from morning till late at night, may well possess a perseverance essential to mastering foreign drama.

Even now there is an effort in this direction. Some of the best plays of Shakespeare have already been done into Japanese, with an adaptation as far as possible of Japanese flavor; but their production, though meeting a favorable reception, has been on what we should regard as only an amateur stage. It would not be safe, however, to estimate Japan's capacity for literary and dramatic accomplishment by the strength of her ambition. The writer cannot easily forget his own experience in this respect. A class of young men under his instruction in literature in a Tokio college once sought his advice in the selection of a play to be acted at the graduating exercises. Knowing their predilection for subjects involving the impersonation of animals, he suggested one or two scenes from "Alice in Wonderland." These aspiring youths considered the matter for a few days, and then reported that, though they deeply appreciated the professor's excellent selection and his compliment in believing them equal to the production of anything so intricate in speech and so profound in thought, they yet felt obliged to decline entering upon anything so pretentious. Consequently, with all due humility, they had "decided to play Mr. Shakespeare's 'Macbeth' instead." And they literally carried out their decision! When ambition is so self-assured, if Japan's new National Theatre does not eventually come up to the Occidental ideal, it will not be for want of a will to try. J. I. B.

Desmond MacCarthy's "The Court Theatre from 1904-7" (London: A. H. Bullen) gives the history of the Vedrenne-Barker management. By far the most room is allotted to the works and philosophy of G. Bernard Shaw. We cannot help wondering, however, whether to criticise Mr. Shaw is, after all, not labor lost; whether the task might not better be left to Mr. Shaw himself. In such an event, we agree with our author in regarding it as not improbable that Mr. Shaw would write a play in refutation of his former theories. The volume contains an additional attraction in the shape of an appendix of programmes of the various Vedrenne-Barker performances.

The German Theatre in this city will soon present Goethe's "Goetz von Berlichingen," which has never been seen in America. The reasons for this long neglect may be found in the diffuseness of the piece and the impracticable scenic demands of the original. Several acting versions have been made, of which the shortest required four hours and a quarter, and called for sixteen changes of scene. Dr. Baumfeld's version can be performed within the usual time limits, and with only ten changes, some of them easy.

F. R. Benson has made arrangements with Robert Arthur for a second repertory season at the Coronet Theatre, in London, February 17, to March 14. Eleven plays of Shakespeare, including the historical trilogy of "Richard II.," "Henry IV." (Part 2), and "Henry V.," as presented at the Shakespeare Festival at Stratford-on-Avon, will be performed. The programme will also include Goldsmith's "She Stoops to Conquer," Garrick's version of Wycherley's comedy, "The Country Girl," and a new dramatic version of "Don Quixote," constructed by G. E. Morrison and Robert Stewart.

Music.

CHARPENTIER'S "LOUISE."

Oscar Hammerstein is undauntedly pursuing his policy of transplanting to his Manhattan Opera House the repertory of the Paris Opéra Comique. He began with "Les Contes d'Hoffmann," which was followed by "Thais"; and last Friday witnessed the first American production of Charpentier's "Louise." Gustave Charpentier is one of the most interesting and eccentric of characters in modern France. A poet as well as a composer, he wrote a libretto and set it to music, the result being an opera which he called "Louise" and which is largely autobiographic. It was an immediate success when produced nearly eight years ago, and has remained prominent in the repertory of the Opéra Comique ever since. In a few years the composer, not having to share the *tantièmes* with a librettist, earned over half a million francs, most of which he spent in providing for the comfort, pleasure and instruction of the working girls, from whose ranks the heroine of his opera is recruited. A special conservatory of music for their use was one of his institutions. Then he disappeared from Paris to live near Monte Carlo; he is supposed to be at work on a sequel to his opera, but as he writes to no one, nothing definite is known, and the world has once more cause to speak of the eccentricity of genius.

Perhaps it would be too much to call "Louise" a work of genius; but it certainly is the product of an uncommonly clever mind. Louise is the daughter of a workman; she falls in love with a young poet named Julien, and as the parents refuse their consent, and marriage without parental consent is impossible in France, they elope and take up their abode in a little house on a bluff overlooking Paris, which is seen in the background brilliantly illuminated. Friends of the pair organize a festival, which gives occasion for brilliant processionals and dances in the style of spectacular grand opera. Louise is crowned queen of the day, Muse of Montmartre. In the midst of the festivities her mother arrives to beg her to return to her home where her father is dying. Louise obeys; the father recovers; but Louise is no longer his child, as she was before the elopement. The moment comes when the memories of her lover and the free Parisian life she has led throw her into a delirious ecstasy, which so angers the father that he throws open the door, bids her go, and hurls a chair after her. A moment later he is overwhelmed by a fit of remorse; but it is too late.

"Louise" was heard by a large audience and enthusiastically applauded, especially after the third and fourth acts. Many had doubted whether an opera so essentially Parisian as this is, with its characteristic street scenes and cries, would please an American audience; and these doubts were strengthened by the fact that "Louise" has not been a lasting success in any city outside of France. But they were dissipated by the reception accorded the opera. The excellent performance under Mr. Campanini, with four distinguished artists like Mmes. Mary Garden, Bressler-Gianoli, MM. Dalmores and Gilibert, no doubt contributed much to this success; but apart from this, "Louise" is an interesting operatic story, and Charpentier's music is nearly always entertaining. In its climaxes it is stirring.

A book of uncommon interest is E. T. A. Hoffmann's "Musikalische Schriften," edited by Dr. Edgar Istel of Munich and published by Greiner & Pfeiffer, Stuttgart. Hoffmann was an original character, endowed with the greatest variety of intellectual gifts, which enabled him to excel in the most diversified pursuits. He was novelist, poet, jurist, and caricaturist. He was also celebrated as a leader of the orchestra, director of the opera, composer, and musical critic. A quarter of a century before Lortzing he composed an opera, "Undine," the text of which was taken from Fouqué's version of the fairy tale. After twenty-three successful representations in Berlin, the theatre with all the decorations and fittings of the stage was destroyed by fire, and the score suffered the same fate. Carl Maria von Weber was enthusiastic in praise of this musical production, by which he was strongly influenced in the composition of the "Freischütz." Hoffmann's writings were read with interest by Schumann, Berlioz, and Wagner, and contributed to their development.

In Paris Bruneau's "L'Attaque du moulin" has just been revived successfully, after an interval of thirteen years. It had thirty-eight performances when first produced. Delna again sings the leading rôle. Glück's "Iphigénie en Aulide" has been revived at the Opéra Comique, while the Grand Opéra is preparing to produce the "Hippolyte et Aricie" of Rameau (who died in 1778). Dijon has anticipated this move by producing "Dardane," which Rameau considered his best work.

Paderewski has been offered and has accepted the directorship of the Warsaw Conservatory of Music.

Art.

Practical Wood-Carving: A Book for the Student, Carver, Teacher, Designer, and Architect. By Eleanor Rowe. New York: John Lane Co. $3 net.

The relationship of wood-carving to the other sculptural arts is indicated rather by implication than by exposition in Miss Rowe's book. Nowhere in it, at all events, are the references to this relationship summarized in a concise admonition to the student that intellectual appreciation of the essential character of the art cannot be stimulated too early. Knowing where one ought to come out obviously prevents purposeless blundering. Yet it is doubtful if one young person out of a score who hope to make a living from wood-carving—and architects appear to be agreed that the demand for competent wood-carvers greatly exceeds the supply—understands that even moderate success will depend upon possessing precisely that power of realizing the facts of form and surface which every successful sculptor in other branches cherishes as his most important professional asset. Wood-carving has, to be sure, its craft peculiarities, which may perhaps be summed up in the statement that it exacts the sharpest and most definite treatment of any of the kinds of sculpture. It is marked, in its best estate, by simplicity of line, clear delimitation of planes and comparatively unmodulated surfaces. In the last analysis, however, color, variety, and interest in wood-work are an outcome of good drawing.

Generalizations of this sort, placed at the beginning of a book of practical instruction, would, no doubt, be meaningless to many of the amateurs who enter upon the practice of wood carving without sound draughtsmanship. It might, however, now and then arouse a thoughtful beginner to the necessity of grasping, either before or while acquiring the special methods of the art, the principles that underlie all good modelling. Miss Rowe undoubtedly believes all this, for she says specifically, toward the end of the manual:

> Every carver should be able to draw, and should study design, but he will learn more in the beginning by trying to adapt a good design to his own needs than by endeavoring to strike out a line of his own without any regard to the traditions of the past.

At the same time, the criticism seems fair that she treats wood carving rather as a craft than as a branch of art.

Barring that defect—if it be such—the manual is certainly practical, by reason of its explicit instruction through well selected examples of our own and other times. Both photography and directions in very distinct English have been employed in the attempt to show just how to do it—how best to grind and strop tools, to shape the wood before carving, and to make the various cuts. The ordinary constructional forms used by cabinet makers are explained by diagrams. The qualities of different woods are described in detail—a feature valuable for others than beginners. For encouragement and inspiration, as well as instruction, many photographs of carvings of various periods are reproduced; and a few of them are also analyzed diagrammatically. There are included bits of architectural modelling in wood, largely from English and French collections. coffers, cabinets, chests and boxes, picture frames of several periods, Renaissance carvings in high relief by Grinling Gibbons, and a few productions of the present day school. That no Japanese work is shown occasions a little regret, for of all wood carving ever executed anywhere, no other gives stronger evidence of orderly technical power. guided by taste and temperamental enthusiasm.

In the series of books on art, in red covers, which are published in London by Duckworth and in New York by Charles Scribner's Sons, the latest volume is on Rembrandt, by G. Baldwin Brown. Without being a specially illuminating piece of criticism it is a capable bit of work, and a pretty complete one, giving a great deal of information about the paintings, etchings, and drawings, the technical methods, and the qualities of the art of the great Dutchman, and what is really known or reasonably surmised as to his life, in a shape hardly to be so conveniently found elsewhere. When we add that there are forty-odd plates, well chosen and fairly well reproduced, representing every phase of the artist's work, we have indicated that the book will be welcome.

"The Christ Face in Art," by James Burns (E. P. Dutton & Co.) and "The Child in Art," by Margaret Boyd Carpenter (Ginn & Co.), are two examples of the kind of book in which the text furnishes an excuse, such as it is, for the reproduction of a number of works of art of different epochs, thus producing a salable commodity for the holiday season. They need not be more particularly considered.

The Metropolitan Museum of Art has received another large consignment of Greek and Roman originals. There are 127 objects, of which the most important are 11 marbles, 45 vases, and 27 bronzes, covering practically classical art from the decade immediately preceding the Parthenon to the best period of work under the Empire. The collection includes an exquisite marble relief, A Young Horseman, executed in a spirited manner and with striking perfection of detail. Edward Robinson, the assistant director, thinks he "may safely prophesy that it will be regarded as one of the great treasures of the classical department." The date is tentatively placed as "probably not earlier than the second half of the fourth century." Other noteworthy accessions to the collection of marbles are The Torso of a Boy of the Pheidian school not later than the fifth century B. C. and a life-size fragmentary Statue of a Woman, a production of the sixth century. The bronzes include a small statue of a Greek discus thrower in a fine state of preservation. It belongs to the period immediately preceding the age of Pheidias. As bronzes of that time are rare and even when found are generally in a poor condition, this accession is of special value. All the vases are painted, thus giving additional information about an important branch of ancient art. One of the vases, a painting called The Battle of the Amazons, shows the first extant attempt at foreshortening. Among the thirteen miscellaneous articles is a little gold cup of the Mycenæan period. This is the only article of its kind that the Metropolitan Museum possesses. The collections of stained glass, of wood work, and of textiles have received important additions, both by purchase and gift from the collections made by the late Stanford White. A panel painting, "Three Saints," by Lorenzo Costa, has been given by Rodman Wanamaker.

Among the exhibitions at the dealers' galleries in this city are portraits by A Benziger at M. Knoedler & Co.'s, till January 11; pictures by Willard L. Metcalf Montross's, January 18; and water-color by F. Hopkinson Smith, Theodore C. Noé's, January 18.

The eighth International Congress of Architects will meet May 18 to 24 in Vienna. In connection with this convention there will be an international architectural exhibition, which is to remain open until June 24.

The trustees of Columbia University have appointed Kenyon Cox to be professor of painting, Daniel C. French professor of sculpture, and John La Farge professor of the decorative arts. They will be members of the Faculty of Fine Arts. The nominations were made jointly by President Butler of Columbia and the Council of the National Academy of Design, in accordance with the terms of the agreement between the Academy and Columbia University. The new professors will take up their duties with the opening of the next college year in September.

On January 13, the Anderson Auction Company of this city sells a collection of Japanese prints, 300 lots.

Some of the pictures of the late Paul Leroi (better known as Léon Gauchez) were sold at auction in Paris on December 16. John Russell's Portrait of a Young Lady, in pastel, dated 1789, brought 30,000 francs, the highest price ever paid for an example of this artist. The record hitherto had been 1,650 guineas, paid at Christie's in 1900 for his Portrait of Miss S. W. Chambers, dated 1798. A Rubens Triptych, a finished sketch for the Elevation of the Cross at Antwerp, brought 175,000 francs, as against 3,200 guineas at Christie's on May 4, 1901.

At the auction at Christie's, London, December 14, Reynolds's Lady Dashwood and Child brought £2,730; Lawrence's Miss Anna Maria Dashwood, £1,470; J. Hoppner's Portrait of a Lady in blue dress, £1,575; W. Peters's Hebe, £525; F. Mieris's Two Boys at a Window amusing themselves with a cat, £325; and P. Wouverman's Scene at a Village Fair, £378.

The death is reported of Prof. Tito Azzolino, director of the Academy of Fine Arts, Bologna, and an architect of prominence. He had published "Fr. Cochi pittore architetto," 1881; "Concorso per il palazzo della Cassa di Risparmio di Pistoia," 1897.

Finance.

DISAPPEARANCE OF THE "PREMIUM ON CURRENCY."

The old year ended with a premium of ¼ of 1 per cent. paid for moderate sums of currency in Wall Street; this premium, hich was first quoted at the opening of ovember, had risen at one time (November 12) as high as 4 per cent. The New year began without any bid at all. For the first time since November 2, it was possible, on Thursday of last week, to say that certified New York bank checks were no longer selling at a discount. As usual with a long-expected event, its arrival attracted little notice, unless perhaps the week's advance on the Stock Exchange was partly connected with it.

The ending of the premium has, however, suggested numerous comparisons. In 1873 New York bank checks continued at a discount during five successive weeks; in 1893 the period was exactly one month. In 1907 it lasted two months, or twice as long as in 893. In this connection two questions arise: why the depreciation of checks has lasted so much longer than in other panic years, and just how far disappearance of the premium meant that normal conditions were restored. The answer to the first question is, that on no such previous occasion had New York banks been so heavily in debt to interior institutions. In former panics, New York called in such outstanding balances as it could when the crisis was over, and made good the rest with imported gold. In 1907 it was New York which owed heavy sums on balance to other American cities, and which, therefore, had to pass along the imported gold.

What the end of the premium means is, that New York banks are providing all "payroll money" and permitting local depositors to draw in full. It could hardly be said last week that they were providing cash for all drafts by inland banks. The reason why interior banks, unable to cash their drafts on New York, stopped selling them at a discount in Wall Street, was that the inland banks no longer needed the cash. Not only did these interior cities make a better showing of reserves, at the December statements of the national banks to the Comptroller of the Currency, than did the New York institutions, but the disposition among depositors to return their hoarded cash to bank was more general in those sections than in the East.

Disappearance of the premium on currency, however—or, to put the matter in another way, rise in certified bank checks to par with cash—is the plain enough signal of an approaching general return to normal bank conditions. There will be occasion enough, hereafter, to review as a whole the episode of suspended cash payments, to fix the responsibility, and to determine whether such recourse to the methods of insolvency without either the excuse or the penalty which goes with other insolvencies, is to remain as a chronic and recurrent stigma on American finance. For the present, the question of interest is, what is to happen in the money markets when the banks of this country are again doing business as they should? Not a few experienced financiers, in positions of importance, predict continuance of money stringency.

This opinion they deduce from the facts that London has large repayments to make to Paris, for the gold advanced by the Bank of France during our run on the Bank of England; that German finance is still under heavy strain; and that our railways will take the earliest possible opportunity of selling bonds to take up the $300,000,000 short-term notes on which they raised money during 1907. Against these recognized influences, most people will place the effects of world-wide trade reaction. Shrinkage in business activity releases currency in several ways from the channels of interior commerce. There is less retail buying; therefore people keep less cash in their pockets, and merchants less "change" in their tills. When production slackens, fewer hands are employed, and employers need less cash for payrolls. Reduced commercial activity means smaller requirements of cash reserves as a support for loans at the average country bank; its accruing reserve money, therefore, flows to banks in the larger cities. When, as is true to-day, the country's actual circulating medium has been enormously inflated by the gold importations and other expedients of the panic time, this tendency must necessarily increase.

On Thursday of last week, the Bank of England reduced its official discount rate from the 7 per cent. level established November 7, to 6 per cent. This was at least significant. Of itself, the action cannot be taken to mean quick restoration of easy money, either on Lombard Street or here; for it is forty-three years since December has closed with a 7 per cent. Bank of England rate; and yet the Bank itself ended 1907 with a gold reserve $11,500,000 above that held at the same date in 1906, and much larger, both in actual amount and in its ratio to deposits, than at the similar date since 1902. Indeed, the rate at the other London banks, on December 31, was 2 per cent. under the Bank of England. Apparently, what that institution feared was continuance of New York's bid of a premium for London's gold. The fear was groundless, and when, last week Monday, American bankers made no effort to attract even the gold arriving in London by that day's South African steamer, the governors of the Bank no doubt decided on reduction.

But when this much has happened, what is to follow next? Precedent, at least, points to a rapid succession of reductions. In 1873, when the American panic forced up the London bank rate, first to 7 per cent. and then to 9, the first reduction, to 8 per cent., occurred on November 20; it went to 6 on November 27, to 5 on December 4, and to 4½ on December 11—four cuts in four successive weeks. By January, 1874, it had reached 3½. The London panic of 1866 brought about a bank rate of 10 per cent. It was first reduced to 8 on August 10; the next week it went to 7, the next to 6, the next to 5, and it stood at 3½ by the close of the year. The 10 per cent. London bank rate of the panic of 1857 was cut to 8 on December 24, to 6 on January 7, to 5 on January 14, and by February 11 was down to 3.

As a rule, this swift return of easy money after a London panic has been paralleled by the after-panic movement in the American market. The last day of December witnessed a call money rate of 30 per cent., in New York, with thirty-day loans at 15 per cent. These were familiar rates in the immediate sequel of all previous panics. Yet, four months after the panic of July, 1893, call money went at 1½ per cent. on Wall Street and sixty-day loans at 2. Five months after the Stock Exchange shut its doors on September 20, 1873, the call money rate was 3 per cent. and the rate on commercial paper 5. We are not yet so far away, by two months or more, from the panic of last October.

TWO NEW SPANISH TEXT-BOOKS

Harrison's Spanish Correspondence

By E. S. HARRISON, of the Brooklyn Commercial High School. 16mo, 157 pages. $1.00.

This book is the result of the author's experience in teaching Spanish in the classroom. It is planned to enable students to write an intelligible letter in Spanish, with especial reference to business correspondence. The letters given for drill are very numerous and cover a wide range of business subjects. The volume should prove especially helpful to those students who are studying the language with a view to making use of it in their own business life in South America and in our Island territories. The book has a full vocabulary.

Schilling's Don Basilio

Translated and edited by Frederick Zagel. 16mo. 156 pages. Price $1.00.

This is a practical guide to Spanish Correspondence and conversation. It is planned as a Reading book to be used with a Spanish Grammar, and is intended to meet the wants of those intending to visit Spanish-speaking countries, or to correspond with Spanish business houses. It is written in dialogue-form, in an easy colloquial style. A wide range of subjects is covered, including the every-day details of home life, the toilet, the table, chats with friends, and business arrangements as well. Specimens of correspondence are included. These are letters of both a personal and a business nature, the latter comprising banking, bills of exchange, receipts, etc. A vocabulary is provided.

THE NEW HUMANISM
By EDWARD HOWARD GRIGGS

B. W. HUEBSCH, Publisher, N.Y.

Ready Jan. 15th.

The Prolongation of Life

OPTIMISTIC ESSAYS

By ELIE METCHNIKOFF, author of "The Nature of Man," etc.

8vo. Illustrated, $2.50 net.

In his new work Professor Metchnikoff expounds at greater length, in the light of additional knowledge gained in the last few years, his main thesis that human life is not only unnaturally short but unnaturally burdened with physical and mental disabilities. He analyzes the causes of these disharmonies and explains his reasons for hoping that they may be counteracted by a rational hygiene.

WHAT WE ARE DOING FOR LIBRARIANS

We now have the most efficient department for the handling of Library orders.

1. A tremendous miscellaneous stock.
2. Greatly increased facilities for the importation of English publications.
3. Competent bookmen to price lists and collect books.

All of this means prompt and complete shipments and right prices.

The Nation.

NEW YORK, THURSDAY, JANUARY 16, 1908.

The Week.

Taft-sure-to-win tables are now being put forth by the friends of the Administration, in behalf of the official candidate. Practically the whole solid South is reckoned in, with 213 votes in the convention—but, of course, without one Republican vote in the electoral college. Then enough Northern and Western States are specified to yield in addition 264 delegates. After that, the obedient Territories and islands are counted upon to furnish fourteen more. Even the total thus reached, 491, is short of a majority in the convention, and so in a large but vague way "New England" is expected to produce some forty Taft delegates. This is a fine and glowing forecast. We do not affirm that it will not be verified, but, if the hope be to elect as well as to nominate, there would remain some disagreeable afterthoughts in connection with a nomination so brought about. It would be, on this very showing, impossible to nominate Mr. Taft without the entire vote of the South. That can only mean that the Southern Republican machine, made up of Federal officeholders, is expected to obey the President's orders. What sort of men these Southern Republicans are, we know from Secretary Taft's own frank speech of a couple of years ago. He told them to their faces that they cared for nothing in the party except to control the patronage and run the conventions. To-day, at the word of command from Mr. Roosevelt, they are to mobilize for Taft. It was precisely by such means that Harrison's renomination was effected in 1892; the result of that year's election is not exactly a happy omen for Taft.

Mr. Taft appeared to excellent advantage in his address at Cooper Union last Friday night. He stood up as his own man to express his own views, and they were in the main sound and pertinent. On the chief points at issue, and especially those which have been made against his own Presidential candidacy on the basis of his decisions when a judge, he spoke with emphasis and courage. That the boycott by labor unions is not only immoral, but illegal, he firmly contended; and he set his face against every form of violence in labor controversies. Violence and the blacklist, when resorted to by employers, he condemned with equal distinctness. To the question, put to him later, whether he had changed his views since his own issue of injunctions against labor unions, he answered with becoming spirit that he had nothing to retract or modify. He is willing to see abuses of the writ of injunction guarded against by statute, but is for maintaining its essential vigor as the one great judicial remedy against damage which might otherwise be irreparable. Mr. Bryan has argued that the continuance or suspension of an injunction ought to be determined by a jury. Mr. Taft is against this. He would do nothing to cut through the direct authority of the courts. All accounts agree that the frank and good-natured Secretary made a most pleasing impression upon his audience. His personality is, indeed, so engaging that it is a pity he has so hidden himself behind President Roosevelt. As a dictated candidate, with an army of Federal officeholders as his chief reliance, the independent and solid merits of the man do not have half a chance.

Secretary Taft and President Roosevelt join in announcing that Cuba will be turned over to her own elected officials in 1909. Americans have reason to be proud of this incident in our own and in Cuba's history. Troops and officials, particularly Gov. Magoon, have won golden opinions; and the national good faith has been maintained in word and deed. Moreover, the island is tranquil and prosperous, with a surplus in the Treasury. If Cuba could only produce men capable of taking over the government and running it well for a few years, the republic would be firmly established. But there is the rub. What the hour calls for is a Diaz, but none is yet in sight. When it is remembered that $3,000, judiciously placed, can start a revolution in Cuba, the importance of having a firm government after the withdrawal of the American troops is obvious. The Cuban constabulary, under American officers, have been developed into excellent soldiers, and would doubtless be of value in preserving peace if a vigorous American officer were given command and properly supported by the Administration. But President Palma did not know how, or else did not dare, to use the troops he had; and an American commander-in-chief—were the Cubans to agree to him—would be of little avail if the new President failed to back him up. It is hard to conceive of a government unable wholly to control its military; yet the suggestion that the troops should bear to Cuba something of the relation of the Macedonian gendarmerie to the Turkish government is one to be carefully considered.

Senator Hale's navy bill will be acclaimed by the officers and men of the service because it increases their pay by 20 and 40 per cent., respectively; and by staff officers because it gives them the actual rank and titles of their brother staff officers of the army. The latter provision should go a long way towards settling the perennial dispute between staff and line, from which the army has happily escaped. But the best provision of the bill—the abolition of the General Board and all other boards not constituted by Congress—will, we fear, not be welcomed by the service as a whole. We have called attention to the activity of the General Board. Its chief function seems to have been to commit the United States to participation in the unhappy international race in wasteful battleship building. It has been a source of war rumors, for its proceedings have repeatedly been allowed to leak out. One year it insisted that we must surpass the German fleet because of the Kaiser's intention of subduing Brazil or Venezuela; and another year, that we must surpass Japan, because of the Mikado's desire to fight us. In these ways it has been of service mainly to the sensational press, and a genuine menace to peaceful industrial progress. Of its attempts to influence legislation Senator Hale has abundant knowledge.

When the railroads decided to contest the Constitutionality of the employers' liability law, which has just been upset by the Supreme Court, they got a very sharp warning from the Administration. They were making a great mistake; take the President's word for it, the law was Constitutional; such a resort to the courts could only lead to more drastic legislation, etc. The result showed, however, that the railways might still follow the advice of their lawyers, and not follow the new-fangled plan of taking every question to the White House, there to be determined in a *lit de justice*. Now it is announced that another suit is to be brought to test the legality of one of the clauses of President Roosevelt's own railway-rate bill. This is the clause compelling the railroads owning coal mines to dispose of that property before the first of next May. Attorneys skilled in the law have advised the "coalers" that they need not comply with this part of the rate law, since it is confiscatory. This is especially the case with those roads of which the coal properties are part of the underlying security of bonds. At all events, the issue is to be joined in the courts, yet not one fulmination has come from Washington. Indeed, the implication rather is that the government welcomes the test suit, as a good way out of a dilemma. Such is the difference between the ferocity of an Administration when the country is prospering and elections far away, and its mild manners when panic has come and a President is to be elected.

If 5,000 persons had been killed and 76,286 injured in battle, or in two or three accidents, the country would be aflame at the news. Because these casualties occurred on our railroads in the course of twelve months, nobody pays much attention to them. The Interstate Commerce Commission gives the ghastly figures in its recent annual report. They bring up the question anew: "What are you going to do about it?" One great trouble is the lack of obedience to orders and the absence of discipline among railway employees. This view is strikingly confirmed by an article in the current *Atlantic* entitled "Confessions of a Railroad Signalman," in which the author, a practical railway man, gives instance after instance of shocking accidents made possible only by flagrant disregard of the rules of the road. The signal "caution" means, he says, nothing whatever if the track is clear a mile or so ahead. So the engineer of a fast train does not check his speed, trusting to luck to be able to do so when he sees something ahead. Sometimes he can, and sometimes he is too late. Then there is a secret inquiry, and frequently the punishment inflicted is not even made known to the man's fellows. But the most astounding fact brought out in this article is that there is no out-on-the-road supervision of American railroads. Hence, managers are compelled to depend on the reports of employees for news of violation of rules. But, the author adds:

> Employees do not and cannot be compelled to report their associates; consequently negligence of all kinds is practically unchecked.

The attitude of Congress this year toward the immigration problem can hardly fail to be influenced strongly by the record of the last few months. There could be no more emphatic reply to some of the current fallacies on the subject. It is assumed as a rule by the restrictionists, for example, that the foreigner comes here because of crazy notions of a land where gold is to be picked up in the streets; that he settles down where he is not wanted, and turns a deaf ear to the claims of localities where his work is sorely needed. Well, the answer comes in the immediate effect of industrial depression on the influx of foreign laborers. The arrivals at Ellis Island last November were six thousand above those of November, 1906, itself a record-breaking month. About December 10, however, a decline began. The month's total was 49,000, as against 64,000 for December, 1906, while Commissioner Watchorn estimates the decline thus far in January as about 60 per cent. from the normal. This has also been accompanied, as has been noted, by a remarkable increase in the outward-bound steerage traffic. The foreign laborer does know when it is worth while to come here, and when it is not. No army on earth could be more mobile than this mighty industrial force. Ellis Island may thus be no less trustworthy than Wall Street as an indicator of business conditions throughout the country. The realization of these facts will not put an end to the restrictionist agitation; but it should force the abandonment of some of the old weapons of Knownothingism.

The question whether a company whose shareholders are numbered by the thousands, whose stock is dealt in on the exchanges, and whose policies regarding dividend and surplus are a matter of concern to all investors, has the right to refuse to owners of its stock all information regarding earnings, assets, and liabilities, is an old one. It was brought up definitely, however, in the annual meeting last week of the American Sugar Refining Company. The stock of this corporation, amounting to $90,000,000, and with its common and preferred shares held respectively by 9,833 and 9,244 individuals, has for sixteen years been actively bought and sold on the Stock Exchange. And in all this long period, the management has refused to inform the stockholders as to what the company was earning in a given period; how its assets and liabilities were changing, and out of what surplus profits its dividends were paid. From the beginning this attitude has been wholly unwarranted. The late Mr. Havemeyer's contention, during his career as president, that public statements of earnings were bad policy, because competitors would thereby learn what was going on, is shown to be baseless by the case of the competitive railway industry, where frequent and detailed statements have been published for a generation past. The discussion of the matter at the annual meeting was at the instance of a gentleman who was not only the largest single stockholder of record, but who apparently held five or six times as much Sugar stock as all the directors combined. The result was a somewhat grudging consent of the directors to modify their policy. Exactly what that modification may be they do not say. Our own opinion is, that nothing short of a full statement of earnings, payments against fixed charges, and assets and liabilities, made at least semi-annually, will at all answer. Every investor in Stock Exchange securities has a personal interest in this matter—not only because he may become a buyer of the stock, but because the evil influence of the Sugar Company, in shaping the policies of other companies, has been very great. The dangers of such secrecy are formidable. It leads directly to the entrapping of innocent investors, through manipulation of Stock Exchange prices, in enterprises a knowledge of whose real condition might have protected them from loss. In saying this, we do not insinuate any such financial weakness on the part of the Sugar Company; but we do assert that until it adopts a straightforward and public policy, it will inevitably be suspect.

By what methods shall women agitate for what they regard as rights denied to them under the laws? This question, which has deeply stirred England for the last two years, is now being asked here in view of the attempt to introduce "suffragette" methods into this country by Mrs. Borrmann Wells and her aides. As an example of quiet but steady entry of women into public life, we may cite the election in the most conservative of all English cities, Oxford, as councillor, at the head of the poll, of Miss Merivale, an expert in the matter of hygiene and of housing the poor. Certainly, no breaking up of meetings or attacking policemen, or raiding of the House of Commons, brought about so revolutionary an event as this. It would not have been possible had there not been the years of quiet preparation of the British public for such a change. But the suffragettes maintain that the new methods now adopted have given the cause a prominence in the press it had never had before. Would *Punch*, they ask, have given its last table of contents a frontispiece depicting a suffragette beating the Prime Minister and two associates to their knees, if there had been no militant agitation? Again, in explanation of their reported plan to make at the opening of Parliament a more violent demonstration than any heretofore, they say that for months past they have scrupulously followed Campbell-Bannerman's advice "to be good and patient," only to find that no London newspaper has allotted their pleas a line of space. From this advertising point of view, the suffragettes indubitably have the better of the argument. Yet, even in a press which loves sensations, the tenth raid on the House of Commons will occupy but a little part of the space given to the first. If, as the suffragists one and all believe, their cause is founded on justice and equity, it is bound to win without resort to violence, which, whether by men or women, is certain to alienate many supporters. It was not the tearing down of Hyde Park palings that won practically manhood suffrage, but a recognition that a form of special privilege must end. Particularly does it seem to us true that even from the point of view of the most ardent suffragists, there is no reason for imitating in this country to-day the obstreperous tactics of the suffragettes. If the American cause is to succeed, it must win more converts, both men and women, of the kind that can best be reached in other ways than by noise and violence.

The appearance of a rival Sultan of Morocco in the person of Mulai Hafid has seriously complicated the difficulties of the French government. While prediction as to the exact course of events is hazardous, it is safe to say that the contemplated withdrawal of the French troops from the Moroccan coast towns—their number is nearly ten thousand now—has become an impossibility, and that the dispatch of reinforcements from time to time is not improbable. But the military situation within France itself is such as to make the sudden development of a "foreign enterprise" of such magnitude exceedingly embarrassing. Problems of national defence are discussed with grave concern in Parliament and the press. The law shortening the period of army service to two years was recently made, by Parliamentary action, to come into force some months earlier than was originally contemplated, with the result, as critics maintained, that between the dismissal of one *classe* and the summoning to the colors of another, the defensive strength would be reduced to an alarming minimum. It was this action by Parliament which led to the recent resignation of a commander-in-chief of the army and several other high officers. More recent has been the step reducing the periods of annual training for the Reserves and the Territorial Army. The Deputies have been accused of sacrificing the interests of the nation to their own popularity among their peasant constituents. Finally, one of the measures proposed to deal with the annual deficit of 50,000 men produced by the reduction of military service to two years, has been the cutting down of the European contingent in Algeria by 13,000 men, their places to be taken by natives. The proposal was criticised severely on general grounds of inexpediency. It can easily be imagined what added criticism the present difficulties in Morocco and on the Algerian frontier will now be made to supply. Beyond and above the general pacific spirit which naturally dislikes foreign adventure, is the rabid anti-militarist propaganda of Hervé and his followers—a propaganda which has already gained sufficient support to discourage a policy of conquest in Morocco.

All Germany is mourning the death of a great humorist and artist. Wilhelm Busch, who died on Thursday in his seventy-sixth year, should have had, and doubtless did have, the happiest kind of old age, if it was a comfort to think of the joy he had given for nearly fifty years to the youth of Germany. It would be hard to find a home where there is any education whatever, in which the children have not revelled in "Max und Moritz" and "Hans Huckebein." Jack the Giant-Killer is no more a classic for English-speaking children than are these two books for German. They have appeared in endless editions and forms, and if they have sometimes been frowned upon by stern parents for putting mischief into the heads of children, not even "grown-ups" could deny the humor of the pictures and the wit of the accompanying verses. Countless children have wept at the sad ending of the two bad boys, Max and Moritz. But Busch appealed to grown-ups as well. He was a contributor to *Fliegende Blätter* as early as 1859; and his satirical "picture-books" directed against the Catholic Church, and entitled "The Holy St. Anthony of Padua," "The Pious Helen," and "Pater Filucius," appeared in the early seventies and added greatly to his already well-established reputation. *Fliegende Blätter* might well go into mourning for him, for to him it owed much of its early prosperity. He had an amazing knack of caricaturing persons and situations with mere outlines, and always with sparkling wit or biting sarcasm.

Gaston Maspero describes in the *Journal des Débats* the unwrapping and examination of a mummy which has been for a number of years in the museum at Cairo, and is generally regarded as that of the Pharaoh Merneptah, who is in turn generally supposed to be the Pharaoh of the Exodus. The eminent French Egyptologist admits that for a long time he was afraid of making a close examination of the body, from fear of public clamor. If he had announced, for instance, that no traces of death by drowning were to be found about the body, he would have been assailed as an enemy of religion. On the contrary, if he had discovered any details confirmatory of the Bible story of the drowning in the Red Sea, there would not have been wanting anti-clericals to say that he had been bribed by the Jesuits. It was only last July, therefore, that Pharaoh was unwound from his cerements. Like most royal Egyptian remains, he had not escaped the outrage of ancient robbers, who in their haste had mutilated parts of the head and body. Still, the condition of the body was such as to enable the medical experts to determine that the Pharaoh Merneptah had not died from the entry of water into the lungs. M. Maspero asserts, however, for comfort, that the connection of Merneptah with the Exodus is by no means settled.

Various court proceedings of the last few weeks, involving at least three well-known actresses, reduce to fact the general impression of the large rewards which the stage offers. Salaries counted in thousands of dollars per week are, of course, by no means rare—in the newspapers. In the case of the operatic stage, payment is even cited in terms of thousands the performance. But the public has been inclined to look upon such figures as advertising material. Justice, however, doffs her bandage when she scans a bankruptcy schedule; and the weekly earnings of Mrs. Leslie Carter, for instance, are now a matter of record. They are, on the face of it, very large. They raise the old question of the relative gains of the actor, or actor-manager, and the dramatic author. The accepted tradition has been that the playwright nowadays holds the advantage over the play-producer, and that such a state of affairs represents a marked change from conditions in the early history of the modern theatre. Dramatic authorship in the seventeenth and eighteenth centuries was not a lucrative profession. Jean Bayet, in a recent number of the *Nouvelle Revue*, tells us that Alexandre Hardy, who died in 1631, received three *écus*, or about ten francs, for a play. He wrote six hundred, and thus in his life time earned a little over one-half of a night's receipts from "Peter Pan." The great Corneille forced up prices. He received $400 each for "Attila" and "Bérénice." Molière got $200 for "Les Précieuses ridicules." When Voltaire began to write plays the average reward was ten *écus* and a dinner "to close the bargain." The actors paid for the dinner. The Comédie Française, which paid best of all, had in 1757 a scale of authors' royalties—one-ninth of the profits for a five-act play, one-twelfth for a three-act play, and one-eighteenth for a curtain-raiser. That things are much better now with the maker of plays is not to be denied. The dramatist nowadays, when he hits the public eye, is most often seated in a powerful automobile in which he has been touring Europe during the summer. His summer home, his collie, and his methods of work are the subjects of public interest. Instead of wheedling his way into the actor's favor by purchasing him a dinner, he is dined and wined by clubs, and speaks on the future of the national drama. Still dramatic writers who make ten thousand a year are far less common than performers in legitimate and vaudeville who make $500 a week. As for weekly salaries ranging from $1,500 to $2,500, how many playwrights with annual incomes of $45,000 to $75,000 have we to set up against them?

"RUINING THE PARTY."

At the Hughes dinner in this city last Thursday night some of the speakers referred to a charge that has frequently been made against the Governor. It is that he has, indeed, been a great success in office, but that he has ruined the Republican party in this State. The public has been informed of this by several members of the organization. It was, in particular, loudly alleged the other day by an officeholder whom Mr. Hughes had refused to reappoint to a position which nobody but the officeholder himself thought he was competent to fill. Of course the party was ruined; here he was out of office, and what better proof of ruin could there be than that?

The jargon of politicians is usually worth analysis, and it may be well to ask just what is meant by their complaints in regard to Gov. Hughes. These they necessarily state in the form of a paradox. They begin by admitting that he was the only man who could have beaten Hearst. The party had been so weakened and discredited that it was not able to elect one other man on the State ticket, and nothing but the confidence which the voters had in Hughes saved the Governorship. This might look as if the party were pretty well ruined before Hughes began the work of destruction; but let that pass. The complainants further concede that the course of the Governor has immensely strengthened him with the people. They do not deny that he could carry the State overwhelmingly, as a Presidential candidate, and they know of no other Republican who could be sure of doing so. Furthermore, they admit that the Hughes programme of legislation was soundly conceived and brilliantly carried out, so much so that attack upon it by the Democrats has been made impossible. The net result is, then, that a Governor who has made so enviable a record, and with whom his party is confessedly 100,000 votes stronger than it would be without him, has nevertheless ruined his party.

This seeming *non sequitur* really lets us into the secret thoughts of politicians. Their private definition of "party" is, not an organization to devise and execute policies, or even to win votes and carry elections, but a means of securing offices and building up a machine. This is the reason why their grief is so deep over Hughes being "cold" to the organization. He does not follow all their recommendations. They go to him asking for appointments for themselves or their friends, but do not get them. The Governor names Republicans, but not always *their* Republicans. Now, that spells, to their minds, party ruin.

Let us not condemn them too hastily. Not all of them are moved by personal greed. It would not be true to say that all of the politicians who are hostile to Hughes dislike him because he has not given them fat offices for their individual enjoyment. Some of them are doubtless actuated by a kind of unthinking loyalty to "the organization" as such. The traditional way of playing the game of politics is the only one they know. If Governors and Presidents will not give heed to the men who do the hard work in primaries, conventions, and elections, what is to become of party discipline? It is with a gasp that they ask this question. With such politicians, the trouble is, plainly, not so much the personal appetite for spoils as the cramping effect of political tradition. Men who have used the offices to reward party workers have been successful in the past, ergo, there is no other way to be successful. But other times, other methods. In recent years there have been several leaders to break with the old party routine, and to win victories greater than any hard-and-fast partisan, sticking to the hidebound ways of the regular organization, could have hoped to achieve. Mr. Cleveland was one of these. He ruined his party on more than one occasion, yet somehow brought it larger triumphs and a higher prestige than any man now living. Mr. Roosevelt ruined his party over and over again, in the process of carrying it to unexampled power. Gov. Hughes seems to be bent on going the same gait. He, too, appears to know the secret of ruining his party yet making it stronger than ever.

The cold truth was set forth by Seth Low, in his speech at the dinner. It is that the Republican party is going to need its very best vote-getter in this year's Presidential election. A panic has come on while the party is in power. The effects of the depression are certain to persist through the campaign, and the Republicans are bound to suffer in consequence. Just or unjust, this is the rule of political warfare. And, as Mr. Low said, it would be the height of imprudence and folly for the Republican party to throw away the State of New York. With Hughes as a candidate for the Presidency, everybody admits that it could safely be counted in the Republican column. It would be uncertain in the case of any other nomination. And the qualities which make the Governor exceptionally strong here have impressed the citizens of other States, and would make him, in a time of depression and apprehension, strong there as well. This is the real consideration behind the urging of Gov. Hughes for the Presidency. He has shown himself of calibre and temper fitted for the office, and he is the man whom the party could most reasonably hope to elect. Another candidate might save the party but lose the country. Hughes, even if he ruined the party, in the politicians' sense, would save the country.

THE PANIC OF 1907.

Saturday's statement of the New York banks showed, for the first time since the panic began with the Knickerbocker failure on October 22, a surplus over the 25 per cent. ratio of cash reserve to deposits required by law. In advance of this return to a surplus, the New York banks had resumed full cash payments to depositors, and the currency premium had disappeared. Drafts on New York by banks of other cities were being met in cash; Chicago, Pittsburgh, and Philadelphia banks were calling in for redemption the "wage checks" issued during the currency famine. All this proves that the period of suspension of payments, complete or partial, is at an end.

With its customary absorption in the future, the business community is now discussing nothing but the chances for or against a similar recovery in general trade. On this head, much might be said; but at present we prefer to inquire into the remarkable experience through which we have just passed. No doubt the most palatable comment would be congratulation to our financial institutions for having emerged with relatively little outright insolvency. This view, however, we shall not take. What, to our mind, stands paramount is the refusal by the deposit institutions of this country, during nine successive weeks, to return on request the money deposited; the public sale at a discount, during all this period, and in amounts running to the tens of millions, of certified checks on powerful and solvent banks; and, finally, the forcing upon wage-earners, by employers in half-a-dozen cities, of a makeshift currency not exchangeable for real money in the city of its issue, and not receivable in any other locality. Every one knows that this is a plain and accurate statement of what has happened; in any other country than our own, our people would have described the affair as a shameful exhibition of weakness and bad faith. Why of all nations should the United States, which a few years ago was claiming title as the financial centre of the world, have been the scene of this extraordinary performance?

We are not among those who hold our currency system responsible. An ideal system—a central bank, an elastic currency—would no doubt have mitigated the after-effects of this break-down of credit; but we are convinced, along with the best European critics, that no currency system in the world would have stood against such a raid on bank deposits as occurred last October. But this merely shifts the inquiry to another question: why the money-hoarding mania should reach in this country, at such times, proportions never imagined elsewhere, and why the various banking centres of the United States should be a menace to one another, the moment the American market falls into panic.

One explanation occasionally heard is that in affairs financial our people are impulsive, excitable, hysterical, and that, just as they fling their savings into wildcat investments during such speculative crazes as that of 1901, so, at a time of shaking credit, they see no recourse but to pull out their bank deposits and hide the cash. In this supposition there may be some truth. But the French are notoriously a more excitable people than our own, and they are, moreover, far more disposed to keep their savings in the chimney-corner; yet nothing like this occurs in France. It must also be remembered that the practice of hoarding money, on the first signs of coming panic, has been directly encouraged by past experience. The merchant, the small manufacturer, the dealer in land or produce, who remembered that in August, 1893, his bank refused for five weeks to allow him to draw from his deposit account the cash to pay his hands or consummate his purchases, cannot be wholly blamed if, in October, 1907, he was tempted to get a supply of cash in hand before his bank shut down on payments.

But if the trouble lie with the banks, what is it? Why should our fiduciary institutions be driven to this humiliating recourse, when it is never adopted elsewhere? We believe the simple and undeniable answer to be that our practice of redepositing reserves in banks of other cities, thereby diminishing the safeguard against deposits in the smaller centres, and entangling the banks of East and West with one another to an extent to which no other community would venture, creates a complex of credit which is certain to break down under strain of panic. Of the 6,544 national banks in the field last autumn, 6,178 were the so-called "country banks" which by law are allowed to deposit with banks in other cities three-fifths of their 15 per cent. required reserve. Banks in the larger cities bid for these "country-bank reserves" by paying interest on them. The result, as shown in the national bank reports just before the panic, was that, out of the reserve of these 6,178 country banks, $420,000,000 was placed in more or less distant cities, and only $201,000,000 kept on hand in cash, where it could be used to meet, at a moment's notice, the demands of depositors.

These figures go far towards explaining the suspension of payments, the blockade of interior exchange, and the numerous resultant embarrassments of last October and the months following. It will perhaps be rejoined that the Bank of England holds the reserves of other banks, precisely as do our larger banks in the "reserve cities." But the Bank of England maintains against such deposits a cash reserve, not of 25 per cent., as in New York, but of 40 per cent. or over; and, furthermore, it would not dream of investing such funds in loans to Stock Exchange operators—the chief use which is made of them at New York. Our own belief is, that until these reserve provisions of the banking law are remodelled, or until the practice is modified by the banks themselves, the most perfect currency system in the world will not protect us from repetition of such discreditable exhibitions of American banking methods.

THE SUPERHUMAN JAPANESE.

Jacques Flach, historian and professor in the College of France at Paris, is sure that we shall have to fight Japan, because the Mikado is looking for trouble. "Who knows," asks M. Flach, "if the attack made by the Japanese on the Russian ships at Chemulpo will not be repeated on the American ships tomorrow?" Who knows, indeed? The fact that the American ships are at this moment somewhere south of Pernambuco, in Brazil, does not matter in the least. Chemulpo from Sasebo—about 120 miles; Pernambuco from Sasebo—roughly, about 20,000 miles; what's a little thing like 19,880 miles, more or less, to the marvellous Japanese who succeeded in sending their torpedo boats, apparently *under* water, to the Dogger Banks in the North Sea; who had balloons of observation following Rojestvensky's fleet all the way across the Indian Ocean; who have now veteran regiments drilling by night in Hawaii; whose agents, disguised as lumbermen, have mapped, and mined, for all we know, every mountain pass in British Columbia; and whose cruiser squadron may any day sail into New York harbor and raid the Sub-Treasury? Who shall hope to stand up against a people that unites the swiftness of Jove's thunderbolt with the guile of Bret Harte's Heathen Chinee?

The Washington correspondent of the New York *Times* declares that President Roosevelt and Secretary Root have for some time been engaged in a "systematic and organized propaganda" against the dissemination in the foreign press of just such balderdash as we have characterized. But we fail to see why the efforts of the Administration should have been confined to diplomatic work abroad. There is much room in this country for missionary labor in the same sphere. Timid citizens who foresee a Japanese invasion of Wall Street—bent, presumably, on capturing our currency premium—are not without backing in the press. The New York *American*, for instance, knows that some time ago, when our naval department was negotiating the purchase of fifty Whitehead torpedoes, Japan stepped in and bought up the entire Whitehead stock, leaving us helpless; that American torpedo manufacturers have been selling extensively, and *secretly*, to agents of the Japanese government; that the Krupp armament works in Germany "have almost been subsidized"; that in Japan "a censored press has purposely created the impression that the nation was in financial stress," though actually, "beyond the vast expenditure described above, Japan has accumulated specie exceeding 600,000,000 yen," and can carry on war by land or sea "for years to come." Finally, Japan now has at her disposal 10,000 men of military experience in the Philippines, 50,000 in Hawaii, 100,000 on the Pacific slope. Lest the scoffer be moved to question the authenticity of these figures, he must know that they are the "careful estimate" of that eminent authority, Congressman Richmond Pearson Hobson. Who the authority is for the $300,000,000 stored up in Tokio and Yokohama is not stated; but probably it was Thomas W. Lawson.

And so it goes. Superhuman malice, superhuman ability, and superhuman guile actuate every move of the Japanese government and its subjects. Other nations buy their munitions of war in the full glare of publicity, and even supply rival governments with a periodical statement of their stock on hand; but Japan buys American torpedoes privily, and actually has them shipped "to various ports in Europe and the East," instead of keeping them in this country to celebrate the next Fourth of July. Other nations impose restrictions on the press, yet somehow the truth, in greater part, reaches the outer world. But Japanese censorship is almost fiendish in its effectiveness. It stirs up certain newspapers to attack the government in order to create the impression of national discontent, and thus lure on the United States to its destruction. It tampers with the crop reports so as to make out the rice harvest a failure, whereas Japan's granaries have been bursting with earth's bountiful yield. Nay, Japanese censorship last year went so far as to induce the inhabitants of the northern provinces to pretend that they were starving, and to sell their children into slavery to secure money for food, whereas the country was in fact tremendously prosperous. And so well did the Japanese peasants play their part that some thousands of them did actually starve to death, and foolish Americans gathered relief funds, which, needless to say, have been invested in torpedoes to be used against Admiral Evans's fleet.

The irony inherent in this conception of a mythical Japanese nation of supermen, is that, in fact, no nation ever won its victories or pursued its ways in peace by more humanly normal and commonplace methods. That the world at large should have gone a bit out of its head about the qualities of the Japanese while the war was in progress is natural. But the calm investigations of competent military authorities and skilled post-bellum observers have tended in the one direction of stripping Japanese achievement of its miraculous character. Japanese courage in the war was admirable, but it is agreed that the Russian soldier displayed courage in no way inferior. Bushido, Emperor-worship, ancestor-worship now ring somewhat hollow. The Japanese fought for a great cause—national preservation, as they conceived it—and fought for it with human gallantry, just as this country did in the civil war, or Germany in the war against France. Port Arthur fell because the Russian generals were incapable, and General Nogi was willing to pay the price in human lives, as Gen. Grant was in the Wilderness. The Japanese generals did not escape blunders. Admiral Togo did not swoop upon Rojestvensky in the Gulf of Guinea, or at the Cape of Good Hope, or at Madagascar, but made his base just where any admiral would naturally have placed himself.

We have not given up hope, therefore, that the time will come when the Japanese will be regarded by the white man as only human, after all. When their government signs an unsatisfactory treaty, they riot; when they take possession of a conquered country like Korea, they play the bully; when their crops fail, they starve, and often emigrate. Best proof of all concerning their susceptibility to human weaknesses: when we slapped them on the back two years ago and told them they were the greatest people on earth, they believed us.

THE PRUSSIAN SUFFRAGE.

The demonstrations in Berlin against the suffrage laws are an ominous sign. It is easy enough to disperse mobs, to beat the marching people with the flats of sabres until they flee; but that, far from curing anything, merely intensifies the public anger and unrest. The political consequences are bound to be grave. True, the issue relates only to the kingdom of Prussia, and not to the German Empire. With the suffrage laws governing the elections of members of the Reichstag the nation is satisfied. But in this case the politics of Prussia cannot be separated from the politics of the Empire. From the beginning of Von Bülow's "block" policy, it was foreseen that his plan might fail because of his attitude toward the Prussian suffrage and the stubborn Poles, although these are primarily domestic questions for Prussia, having on their face no direct interest for the voters of the other confederated states, or for national parties.

But Prussia is too large and influential a part of the Empire to make it possible for those who are fighting the battle of democracy against the vested interests and the privileged classes in the nation at large, to fail to wage the same war in the Prussian kingdom. Indeed, it seemed this autumn as if a victory might be easily won in just this matter of the suffrage. The Liberal press has for months been assuming that Von Bülow would grant substantially all the changes asked for, as a sop to keep the Liberals happy in their "block" and loyal to his programme. Moreover, the Conservative newspapers have shown in their discussions of the suffrage a fear of the supposed concessions. Hence the intense public disappointment at Von Bülow's response to the demands of the reformers, rightly described by the Berlin *Tageblatt* as "curt, harsh, and imbued with the worst reactionary spirit." The government, he announces, does not regard manhood suffrage "good for the state," nor secret voting, although that is the rule in the Reichstag elections, and has worked no more harm there than in the United States or England.

When all Germany was seething with revolution, on April 8, 1848, the frightened Prussian government bestowed the ballot on every Prussian twenty-four years of age. It not only gave universal manhood suffrage, but guaranteed secret voting. A year later, on May 30, 1849, the reactionaries, feeling themselves sufficiently strong, repealed this law, and substituted the indirect "three-class system" and the open voting requirement. It is against this law which has remained unchanged for nearly fifty-nine years, that the present agitation is directed. It has put Prussia entirely in the control of the land-owners and the wealthy. It has made of the country a persistently autocratic state, based on a tottering agricultural system which is saved from total collapse only by the active assistance of the state and federal governments and by copious aid from the Imperial treasury in the shape of tariff duties on foodstuffs. In certain sections of the population which have the ballot, not 2 per cent. dare to exercise the right, and the "three-class system" has not only been successful in excluding from the Landtag any Social-Democrats, but has made it possible for 12 per cent. of the enfranchised electorate to choose 803 representatives, while the other 12 per cent. that took the trouble to vote were able to choose only 140 representatives—without a delegate of the working classes among the 943.

As for the open ballot, the arguments advanced in favor of it might have carried weight in 1848, but not to-day, among men who believe in justice and fair-play. Under existing conditions, middle-class professional and business men fight shy of the ballot, even when they are entitled to it. They avow a lack of interest in politics as an excuse for staying away from the polls. Frequently they are threatened with a boycott if they do not vote as directed by the privileged classes, and with the same punishment by the opposing political organizations, if they do. Between these two fires, disuse of the right to vote, is, as the statistics show, the easiest way out. "There is nothing more immoral than open voting," declared Herr Fuhrmann, a Liberal land-owner and a member of the Reichstag, in a public meeting recently, and he did so at the risk of his political life. To him the *Junker* will show no mercy hereafter. It matters not that out of Prussia's 37,000,000 people the Socialists can point to 30,000,000 who are without property and without the right to vote. The spirit of the feudal overlord is almost as rife in Prussia to-day as in Russia; and the momentary failure of the Russian revolution has no doubt emboldened the Prussian reactionaries and their obedient Von Bülow to resist the popular will.

What that will is has been clearly shown by the events of the last few days. Even women, we learn, threw themselves in the path of the charging police and clung desperately to the bridles of their horses—ready to sacrifice their lives if necessary that their husbands and brothers might have a share in the government. For any Chancellor or any king to set himself in these times against such a demand—when even in Persia the public is winning the same rights—is the height of folly. But for the army, the authorities could not persist in their attitude for a single instant—another example of the way the fear of war is made an instrument to curtail the people's liberties. Von Bülow and the Emperor seem to think that the Prussian people will stand anything. Crushing taxes, a steady rise in the cost of living until meat has become a luxury, new loans to surmount a deficit of no less than $110,000,000, forced service for two years in army or navy—all these things go to make the lot of the Egyptian fellaheen under British rule almost to be envied by comparison. But history shows that the insolence of autocracy leads merely to a day of reckoning—as it did in Germany in 1848.

SUNDAY-SCHOOL TEACHING.

In an article entitled "Educational Needs of the Sunday-School," in the *Educational Review* for January, Charles E. Witter of St. Louis discusses a subject that perplexes many thoughtful parents. Mr. Witter says that "an increasingly large number of intelligent people" are "deterred from teaching in the Sunday-schools and other departments of the orthodox churches." His first complaint is that there is a "large element of insincerity in the teaching." Persons who have "outgrown the crude and literal interpretations of early years" are "seemingly afraid to impart their real light to their young hearers." These teachers give "not the fresh views that have proved more satisfactory to themselves, but the traditional statements of orthodoxy." The result is that the teacher must be constantly juggling and trimming, and that in time "those young people who read and think" will "awake to the superficiality and falsity of such teaching." In the reaction against "these feeble and narrow views of spiritual truth," the rising generation may be "led to reject all versions of it." Mr. Witter specifies that no reputable expert in theology attempts seriously to uphold the old theory of verbal inspiration, and the old notion of "the marvellous and detailed fulfilment in the New Testament of prophetic predictions in the Old." Many of the miracles, "particularly of the Old Testament," are now set down by competent scholars as myths. Nevertheless,

> The committee having in charge from time to time the outlining of topics for study in the International Sunday Lesson, seem determined to keep just this mythical, this so-called supernatural element, to the fore, doggedly ignoring all that even conservative Biblical scholarship has had to say.

The remedy which Mr. Witter proposes is not so clear-cut and definite as the evil of which he complains. He would not have "every new and crude speculation" thrust upon the minds of the young; but he assures us that "Back to Christ and the natural religion that he taught" is "no mere cant, but the serious slogan of honest souls." He would have "honest, positive reconstruction."

To this general attitude many persons who feel that religious development for themselves and their children is hindered by adherence to the ancient literalism may possibly assent. With this reservation, however: that there seems to be no machinery for putting Mr. Witter's ideas into practical effect. All educated people would like to have their children familiar with the Bible—brought up on the best that is in it, from the point of view of style as well as subject matter. To this desired end attendance at Sunday-school is one obvious means; but going to an Evangelical school almost necessarily involves the kind of study that Mr. Witter deplores. For one thing, most of the teachers are incapable of doing anything but following the traditional methods. But no matter what their learning and capacity, there are few orthodox schools where anything else would be tolerated. The introduction of the conclusions of higher criticism into the infant class, or even the adult Bible class, would in most places provoke a furious protest from the older and more conservative members of the church. If Johnny came home with the news that the arrest of the sun by Joshua is a piece of Semitic folklore, Johnny's father and grandfather would forthwith demand that the teacher stop trying to make Johnny an infidel.

And father and grandfather would be wholly within their rights. The Evangelical churches profess belief in the Bible as the inspired word of God, in miracles, and in all the other things which Mr. Witter condemns as "outworn scaffolding." The teacher who doubts these things denies the faith, as Johnny's family very well know. Talk about "positive reconstruction" is pretty enough, but to many minds it denotes positive destruction; and "the natural religion that Christ taught" is a vague phrase that signifies anything or nothing. The root of the trouble is that the Sunday-school teacher cannot run with the orthodox and hunt with the heretic.

Even were parents and grandparents indifferent, Johnny himself would raise difficulties. Your small child is often a hard-headed logician, who insists on following theories to their inevitable conclusion. If he is told that the world was not actually created in six days, that the sun did not actually stand still, and that the whale did not swallow Jonah, he is sure to ask if the story of Daniel in the lions' den is history, and if the reports of the New Testament miracles are true. If one part of the Bible is mythical, why not another? And if this is a collection of myths, why do people make such a fuss about them? Why are they so infinitely more valuable and significant than the Greek myths? These are the doubts which children are sure to raise when once they are started on the path of skepticism. Talk about the "deeper spiritual truths" which underlie the "superficial inaccuracies" of the Bible is unintelligible to all children and to many adults.

Moreover, the child can never be brought to understand why the worthy members of the church do not believe and are not expected to believe the creed which some of them repeat every Sunday. If they don't believe it, why say they believe it? If the words really mean something else, why not change them? When Edward Stanley, father of the Dean, was on his travels, he found at Amsterdam a Mr. Lowe, the minister of a Presbyterian church, who had not been troubled by the French authorities after the annexation in 1810, on consideration of his praying every Sunday for the health and prosperity of Napoleon. "What did it signify?" said Lowe. "God Almighty understood very well what I meant, and that I heartily wished Napoleon's death all the time." This is not a bad parallel to the attitude of some of our enlightened and progressive Christians. The child who is not initiated into the sophistications of theological casuistry cannot see the sense in having a set of words which means one thing at one time and another thing at another, and in having a Bible which is true and is not true, which you believe and do not believe. Nor do we see how, children's minds being what they are, they can ever grasp these paradoxes.

CANNED SPEECHES.

A gentleman in Philadelphia has written a little book entitled "Ready-Made Speeches." Ready letter-writers we have had in plenty, and they undoubtedly supply a general want at a time when everybody is writing letters of resignation, letters of indignation, and letters of explanation, in addition to the more common kinds of epistolary interchange. But if as a nation we write much, we talk—and in public—still more. "All Americans," as our author says, "insist upon speaking—not necessarily all at one time, but rather frequently." Nevertheless, "only one person in a hundred can speak extemporaneously in public." Hence a volume that is written for the other ninety-nine. Guides to oratory are not rare, but most of them suffer from a fault which our present text-book has avoided, in that it gives us original models from the pen of the author, instead of selections from Demosthenes, Burke, Emmet, Webster, and Mark Twain. We do not doubt that for every young speaker whom such august compilations have supplied with inspiration and example, a dozen have been discouraged by the formidable standard which is set up. And, besides, what could Demosthenes, or even Burke, possibly have known about the vastly different conditions and needs of an age and a land remote from their own?

The very list of contents of "Ready-Made Speeches" is an epitome almost of our national life. We certainly are addicted to presenting flags to military organizations; we give swords and medals to gallant officers, sets of Dickens's novels to the best scholars of the school, silver services to public officials upon their retirement from office, and purses to ministers about to depart for Europe; and for all such occasions, whether fate should select us to deliver the salutation or the response, there is guidance in the little book. Nor will a person find himself at a loss in those rarer instances, when, in the capacity of a statesman, he is called upon to extend his congratulations to the members of a new political club, or, as one of a number of grateful authors, he takes part in the presentation of a picture to a disinterested and paternal publisher, or as a layman at a funeral he is unexpectedly summoned to deliver an address in the absence of an ordained minister. Such chances also are provided for. And we should still be well equipped if in some capacity or other we should be brought to participate in the presentation of a purse to the captain of a fishing schooner for an heroic rescue. As a leading passenger, we might say (pp. 118-19):

> Capt. Daniel Bolt:
>
> Fifteen passengers of the wrecked steamer John Endicott believe that the fact that they are alive to-day is due to the heroism of yourself and crew. . . . Our boats were gone, the waves were beating over us with what seemed like conscious and ever-increasing anger, and the planks beneath our feet were writhing in the Titanic grasp of an enemy whose strength seemed limitless, and who knew no mercy.

And bluff old Capt. Daniel Bolt, twirling his sou'wester in embarrassment, might reply (pp. 122-23):

> Mr. Hopkins and Passengers of the Endicott: You'll have to help me out on the speechmaking tack. My eloquence always has something to do with double reefing the mainsail or getting busy with the tiller. When everything is going all right on an even keel, I'm apt to sail pretty close to the wind, so far as talk is concerned. . . . You forget one party, and she was mighty important; I mean the tug herself. She's a real creature, and unless she does her part right up to the gunwale, the captain and crew can't do the trick once in a dozen times.

We have characterized the present volume as "almost" an epitome of national life. The book is not perfect, because nothing human is perfect, even in Philadelphia; but chiefly because the constantly varying aspects of our national life make an absolutely comprehensive or up-to-date text-book of the kind an impossibility. The sixty standard speeches given might have easily been increased by a half-dozen. We miss, for instance, a model speech supposed to be delivered by a gentleman who has been called a liar by the President. We look in vain for an example of the remarks addressed to a subway guard at the Grand Central Station by a timid old lady who wants to go uptown, with the subway guard's response. We have not been able to find a form of address exactly suited to the needs of a meeting of bank depositors who wish to thank the receivers for their devoted labors in insuring them a return of six cents for every dollar of their savings. But to ask that the author of a guide to speechmaking should foresee all such necessities would be unreasonable. Only a vast compilation, in alphabetical order, taking in every noun in the language, could hope to be really comprehensive. The late F. C. Burnand adopted this method in planning a handbook of repartee. He began with "Abbot, reply to an"; but unfortunately it turned out that the abbot was a Trappist, vowed to perpetual silence, and that, therefore, no chance for repartee existed.

We have not given up hope, however, that some day such an exhaustive treatise on speech—both in public and private—will be written. The interchange of thought will then have been robbed of all possible discomforts. We have gone far towards standardizing our daily speech, but we have not gone far enough. We know what to say when we offer some one else an exceptional line of goods, or submit a proposition, or call attention to an unrivalled opportunity, or assert that credit is the foundation of business. But in lighter moments—between the acts at the theatre, or in our homes, between the musical selections and the various "games" that have been devised to prevent excessive cerebral functioning—there will come a few minutes now and then when one is compelled to drop into conversation. Without a guide-book for such emergencies we are never quite safe.

PARIS BOOK NOTES.

PARIS, January 3.

Charles Renouvier applied all his energies of mind to methodic examination of past philosophies and elaboration of a workable (he might have said, verifiable) metaphysical hypothesis. Personalism was the result, on which William James lectured many years ago. André Arnal, a French doctor of theology (Protestant), adds another to the series of important publications on Renouvier since his death, in a learned volume on "La Philosophie religieuse de Charles Renouvier." It is a far cry from this to the first volume of the learned Jesuit Prat, professor in the Institut Catholique of Paris, on "La Théologie de Saint Paul." And it may not be irrelevant to note here the "Introduction physiologique à l'étude de la philosophie," by J. Grasset, the eminent medical professor and writer of the Montpellier faculty.

Three novelists of the year-end appeal for recognition outside of France. Émile Moselly, as you have already noted, has been awarded the prize of the Goncourt Academy, whose ten members in contradistinction from the Forty Immortals look only on the latest actualities and the potentials of the nearest future. Moselly was a poor boy of Lorraine, who, like so many others, has made his way up in the university to a teacher's post in a provincial state college. His first book, "Jean des Brebis, le livre de la misère," a volume of short stories, and his second, a romance, "Terres lorraines," are written in that clear, colored, intense, and pathetic style which becomes such "regionalist" literature, of which Maurice Barrès is the academic protector. "The Princesses de science," by Madame Colette Yver, won the prize conferred by twenty-three of the leading women writers of France, in the name of the lady's magazine, *La Vie Heureuse*. This author was already known favorably, especially by a curious little romance of a Merovingian princess; and she has done good translations from English romancers. With his hand against every man, apparently, every man's hand against him, Octave Mirbeau needs no prize to make his works known. "La 628-E8" (a typical automobile number under French regulations), in the form of a tourist's stories, has stirred up Belgian life and letters wofully. The particular find of the volume was to have been a sensational revelation about the Polish wife whom the great Balzac so romantically took to himself in the last months of his strange life. The outcome is certainly a lesson to historians who jump at conclusions—as many of them do nowadays. M. Mirbeau was quite unaware that the daughter of Madame de Balzac, the venerable Countess Mniszech, is still living in Paris in a retirement of many years. She at once wrote to the press, demolishing finally what may have been originally only the fatuous boasting of an erstwhile fashionable painter in his dotage; and another person from that ancient time, who had been the painter's secretary for forty years, is also still living, unfortunately for history by conclusions. He, too, gave reasons why the story is impossible. The whole story had to be withdrawn from the printed book. It is a pity that the very great literary talent of Octave Mirbeau, who wields French clear and forcible beyond, perhaps, any living author, should fill his books with bitterness, and too often with something worse than Dead Sea ashes.

The reception of Maurice Donnay to his seat in the French Academy is the occasion of an edition of his "Théâtre," of which two volumes have appeared. Now that his witty, immensely modern sentences may be read in a book, it is not too much to insist on their priceless limpidity—the very reason why the mind catches them up with all their wit and wisdom the moment they are spoken across the footlights. All these pieces also belong to literature in a high sense, though our grandparents might have put some of them out of young people's reach, just as St. John Chrysostom slept with Aristophanes safely under his pillow.

"Euripide et ses idées," by P. Masqueray, professor of Greek literature in the University Faculty of Bordeaux, is a well-written and apparently competent book on a subject of interest in philosophy as well as in classical erudition.

In that borderland of letters, which is made up of reminiscences of literature and the surroundings of literary men, Henry Bordeaux wanders through his favorite native air in yet another pleasing volume—"Promenades en Savoie." This writer is bound slowly but surely for the Academy—unless the Radical Socialist opposition which has already declared itself in Parliament succeeds in doing away with that Conservative glory of France. Léon Séché, whose specialty is the bringing to light of old letters and papers, publishes two more volumes. One—"Muses romantiques"—gives all that he has been able to find about Hortense Allart de Méritens in her relations with Chateaubriand, Béranger, Lamennais, Sainte-Beuve, and the now forgotten foe of George Sand, Madame d'Agoult. The second volume contains the correspondence of the same literary lady, who might not have had her influence with the leaders of the Romantic movement if she had had the right to vote and consequently met on equal terms the men of letters then in fashion. M. Franklin has just published another volume of his own—"La Civilité, l'etiquette, la mode, le bon ton" from the thirteenth to the nineteenth century—with his usual extraordinary amount of contemporary anecdotes and documents on the minute history of French society.

Some notable new volumes have appeared in history, a class of book greatly encouraged by French taste and university ambition. Henri Pienne, professor in the University of Ghent, publishes a volume of his "Histoire de Belgique," making the third in seven years. The present volume deals particularly with French Calvinist influence in the sixteenth century in the various territories—Flanders, Brabant, Hainault, Liège, and the rest—which now make up Belgium; curiously enough the predominance of French in the Catholic country of to-day is due largely to such influence. The work throws light on the important but ill defined Burgundian State. In the long series of the "Histoire de France," written by eminent specialists, each for his own epoch, the editor, Prof. Ernest Lavisse, gives the second part of the seventh volume, on Religion, Letters and the Arts, and War during the years from 1643 to 1685 from the beginning of the reign of Louis XIV. Another long work of history is begun (with the third volume) by E. Mourret, professor at the École supérieure de Théologie Catholique of Paris. It is to be a general history of the Church (between the interminable and uncritical volumes of Rohrbacher and Darras, and the ordinary theological student's manual) in eight volumes: Christian origins (first to fourth centuries); the Fathers (fourth and fifth); the Church and the Barbarians (fifth to tenth centuries, the volume now issued); Christendom (tenth to fourteenth); Renaissance and Reformation (fourteenth to sixteenth, which is the next volume to be published); the Old Régime (seventeenth and eighteenth); Contemporary Church, first period (Revolution and Empire, 1789 to 1815); second period (1815 to 1908). The author, after first taking his university degree in civil law, became professor of dogmatic theology at the famous seminary of Saint-Sulpice, which to a certain degree must accredit the official side of a work intended as a "social history of the Catholic Church, as well as a manual of historical apologetics." For the first time, perhaps, a Jesuit, Pére Camille de Rochemonteix, deals with the famous legal prosecution which wrought his society such harm before its suppression in the eighteenth century: "Père Antoine Lavalette à la Martinique," from unpublished consular and court documents.

A first volume of 990 pages, with 100 colored sketches, of a "Précis d'histoire militaire," by Maurice Dumolin, a former artillery officer, is devoted to the French Revolution, with an introduction on the seventeenth and eighteenth centuries: eight fascicles take up the campaigns of each year from 1792 to 1800. Another volume on the Empire is to follow in January. A book, not all military, and not without lively human interest, is the "Blaise de Monluc, historien," by Paul Courteault. It is a critical study of the text and historic value of the "Commentaires" of the famous captain, who unconsciously wrote almost as well as Cæsar of his own campaigns in Italy and France from 1521 to the religious troubles in Béarn, in 1563, shedding over forty troublous years the light of a straightforward soldier's observation, even though tempered with an orthodox dislike of the bothersome Huguenots.

In the series "Grandes institutions de France," the Institut de France is treated in two volumes, each branch being expounded by its *secrétaire perpetuel*: the French Academy proper by Gaston Boissler; Académie des Sciences by Gaston Darboux; Académie des Inscriptions et Belles-Lettres by Georges Perrot; Académie des Sciences Morales et Politiques, by Georges Picot, and the Académie des Beaux-Arts, by Henry Roujon. Alfred Franklin, the many-volumed writer on details of French life through all the ages, from kitchen and toilet to shops and colleges, having passed his life in the Bibliothèque Mazarine, writes the introduction on the Palais de l'Institut, in which his library is situated.

Louis Prosper Guénin and Eugène Guénin, who have long been charged with the stenographic reports of the French Senate, have popularized the ancient history of their art for readers who cannot delve in Kopp's "Palæographia Critica" for themselves. The book deals with the use and development of the system of Tiro, Cicero's freedman, who reduced to a shorthand system abbrevations, which, according to Suetonius, were invented by Ennius. Seneca brought them up to 5,000 words, and St. Martin of Tours used the signs for reporting sermons. The present book covers antiquity and the Middle Ages.

Among books on art may be mentioned "La Peinture anglaise," by Armand Dayot, a veteran in the reproduction of pictures and engravings of the past. The volume contains 282 illustrations in the text, and 25 heliogravures chosen in characteristic English painting "from its beginnings to our day." "The "Précis d'archéologie du moyen age," by J. A. Brutails, an expert authority, will be of help to students of mediæval history. It begins with a bibliography and follows, in successive chapters, the "causes" of the architecture and its Latin, Romanesque, and Gothic periods; civil and military architecture; and ends with counsels for editing and illustrating archæological studies. "L'Église abbatiale de Saint Denis et ses tombeaux" is a clear and competent handbook of the history and archæology connected with the famous basilica, in whose construction Abbot Suger for the first time applied the principles of Gothic architecture. There the Kings of France were buried for more than a thousand years. The authors, Paul Vitry of the Louvre Museum, and Gaston Brière of the Museum at Versailles, announce a complete historical and artistic monograph on the subject as shortly forthcoming.

In the realm of science, Lucien Poincarè, who is not to be confounded with his more famous mathematical relative Henri, has written a clear and philosophical account of "La Physique moderne." The work has been crowned by the Académie des Sciences, and an English edition is announced. E. A. Martel, who from being a lawyer at the Tribunal de Commerce of Paris became an explorer of subterranean hollows, and invented that curious subbranch of physical geography "spelæology," sums up much special work in a book of general ideas on "L'Évolution souterraine." It has received the Grand Prix for physical sciences from the Académie des Sciences. The Comte de Montessus de Ballore, director of the seismological service of Chili, publishes the summary of what is known scientifically about earthquakes in "La Science séismologique," with a preface by Professor Suess of Vienna. "Explorations géologiques dans l'Amérique du Sud" is a further scientific instalment from the French government mission of Créqui-Montfort and Sénéchal de La Grange. It is written by the geologist of the mission, G. Courty, who accompanies his work with important meteorological tables. The story of another French government mission, from Cbari to Lake Tchad, 1902-1904, is recounted in more palpitating style as a book of exploration by its geographer, Auguste Cbevalier, in the volume "L'Afrique centrale française."

The Académie de Médecine has awarded one of its chief prizes—the Prix Boggic (4,300 francs)—to Dr. Albert Calmette of the Pasteur Institute of Lille, with his assistant, M. Guérin, for their researches, now generally admitted as decisive in France, on "the intestinal origin of tuberculosis and on vaccination against tuberculosis through the digestive tube." A prize of 10,500 francs is awarded to Dr. Dopter for his discovery of the serum treatment against dysentery. Dr. Matignon, who was the French legation physician for several years before and during the troubles at Feking, has a prize for his book on the hygiene of the Japanese army during the Manchuria campaign.

The "Rapport au Ministre des Finances" of M. Arnauné, retiring director of the French Mint, is a veritable statistical annual of moneys and bullion in France, in the Latin Union (France, Belgium, Switzerland, Italy, and Greece, which have an intercommunicating coinage), and in the world at large. The information is given at first hand and is particularly abundant, more so than in any of the twelve years since this important annual report has appeared.

S. D.

NEWS FOR BIBLIOPHILES.

One of the most notable items in the Anderson Auction Company's sale of January 20 and 21 is a copy of that rare periodical, the *Pioneer*, edited by James Russell Lowell and Robert Carter, of which three numbers only, for January, February, and March, 1843, were issued. This copy is bound in half-levant, and has the cover of No. 3 only, but text and plates are perfect. A copy in parts with covers brought $240 in the Whipple sale in 1903; and a similar copy in the French-Chubbuck sale, in 1904, was bought by the Boston Athenæum for $270. The *Pioneer* was a young man's magazine. Its editors promised that each number should be "entirely original," and that the magazine should be "a rational substitute for the enormous quantity of thrice-diluted trash, in the shape of namby-pamby love-tales and sketches," which was offered by the popular magazines of the period. Apparently material for two numbers only was ready when publication began. On January 19, Lowell, who was in New York under the care of an oculist, was writing to Carter, "Have you got any copy for the third number?"; and on January 24, "I *must* write an article for the next number." Again, a few days later he wrote, "You shall have some copy from me on *Wednesday* morning if I get blind by it." He seems to have been unable to do this, as the third number contains only a sonnet by him. Does any present-day collector own one of those broadside advertisements which were pasted up in New York, and about which Lowell wrote: "Handbills of the *Pioneer* in red and black, with a spread eagle at the head of them, face me everywhere"? Other items in the same sale, which is mainly "the library of a Massachusetts antiquarian and historian," are the Horace, published by the Bibliophile Society in 10 vols.; Coleridge's "Poems," first edition, 1796, and the second edition of 1797; and a presentation copy of the first edition of "Uncle Tom's Cabin." On January 22 and 23 the same firm sells a collection, partly duplicates, from the library of the Grolier Club. Among them is a fine set of Blume's "Flora Javæ," both series, 4 vols., with 308 colored plates; Browne's "History of Jamaica," 1756, and Portlock's "Voyage Round the World," 1789.

The Merwin Clayton Sales Company offers on January 22 a collection of autograph letters and documents, mainly from the papers of Elbridge Gerry. There is a folio letter written by John Adams from Philadelphia in June, 1775. It is unsigned, but is endorsed by Gerry "J. A." Two letters of Samuel Adams (one signed with initials only), letters of Major-Gen. Heath, Major-Gen. Lincoln, Major-Gen. Knox, Robert Morris, Arthur Lee, Timothy Pickering, Thomas Jefferson, and others, are included.

Correspondence.

WILLARD FISKE'S "BIBLIOGRAPHICAL NOTICES."

TO THE EDITOR OF THE NATION:

SIR: As doubtless many readers of the *Nation* will remember, the late Willard Fiske issued, during his lifetime, five numbers of a series of "Bibliographical Notices" based upon his Petrarch and Icelandic collections. Nos. I., IV., and V. of these "Notices" contained three supplements to the British Museum Catalogue of books printed in Iceland. Mr. Fiske had collected, and in large part prepared for the press, the material for a fourth supplement. The preparation of this material has been completed by Mr. Halldor Hermannsson, now in charge of the Fiske Icelandic collection in Cornell University Library, and it has been issued by the executors of Mr. Fiske's estate as "Bibliographical Notices, VI.: Books printed in Iceland 1578—1844, a fourth supplement to the British Museum Catalogue, with a general index to the four supplements." No record has been found of those to whom the earlier numbers of the "Notices" were sent by Mr. Fiske, and I therefore take this means of informing readers of the *Nation* that possessors of the earlier numbers may obtain this final number of the series by applying to the undersigned.

G. W. HARRIS,
Librarian, Cornell University.

Ithaca, N. Y., January 10.

THE MARKINGS ON MARS.

TO THE EDITOR OF THE NATION:

SIR: In your issue of December 26 you quote a passage from W. W. Bryant's "History of Astronomy," referring to the "incredibility" of any possible inhabitants of Mars digging "great canals at least a mile wide." No one at all in touch with the subject supposes for a moment that the lines on Mars are canals filled with water. These lines are supposed to be strips of vegetation, dependent on comparatively small irrigation canals of water flowing, or forced, through their centres. It is this vegetation that is visible, and not the ditches of water.

The rest of the paragraph quoted doubts the actuality of these so-called canals. This familiar cry, it is worthy of notice, comes almost invariably from those who have not had the opportunity of a favorable examination of the planet. The "seeing" at Flagstaff is so unusually good that the Lowell refractor, though very considerably smaller than the Yerkes, or the Lick, has greater space penetrating power than either of the latter. The altitude, the unusual steadiness, clearness, and dryness of the air at Flagstaff, render the Lowell equatorial by far the most powerful instrument in existence for the investigation of planetary detail. Only those who have studied Mars with this instrument, or the Amherst telescope, when, at the recent opposition, it was mounted in South America, are competent to say what can be seen on Mars under the most favorable conditions. A number of individuals have enjoyed this privilege, and among them there is only one reliable person who doubts the objectivity of the canals.

Furthermore, it would seem as if the photographs taken at Flagstaff, and more especially those taken with the Amherst telescope in South America, should settle, once for all, the question of the actual existence of these curious Martian markings.

G. R. AGASSIZ.

Santa Barbara, Cal., December 31.

[The 400 canals catalogued by Lowell average 1,500 miles in length, or a total of 600,000 miles; so that the incredibility might be based on length alone. But there must be a considerable width also, to irrigate a strip of desert wide enough to be seen. According to Prof. Simon Newcomb, the *minimum* visible width is fifteen miles. As for the South American photographs, Lowell himself says one's "brain must be open to them; not his eye alone." We are inclined to agree with Mr. Agassiz's anonymous "reliable person."—THE REVIEWER.]

Notes.

"The Letters of the Wordsworth Family from 1787 to 1855," collected and edited by William Knight, are published by Ginn & Co., in three volumes. Most of the correspondence is from the poet and his sister Dorothy.

This month Charles Scribner's Sons bring out the final volume of their edition of Ibsen, translated by William Archer. They publish also the following: "Life of Henrik Ibsen," by Edmund Gosse; "The Religion and Worship of the Synagogue," by W. O. E. Oesterley; "Rembrandt's Etchings," by A. N. Hind; "Diabolo," a guide to the new game, by David P. Ward; and "The Manchester and Glasgow Road," by Charles G. Harper.

G. P. Putnam's Sons announce for early publication "Twentieth Century American," by H. Perry Robinson; "Climate—Considered Especially in Relation to Man," by R. De C. Ward; Bielschowsky's "Life of Goethe," Volume III., translated by W. A. Cooper.

In February Henry Holt & Co. will have ready a new novel by William De Morgan called "Somehow Good." The plot is said to deal with London of the present day.

Taking advantage of Antonio Fogazzaro's contemplated visit to this country, John W. Luce & Co. will issue, January 20, his novel, "The Politician."

Clement K. Shorter is preparing a work on "The Brontës; Life and Letters," which is meant to be a final and complete record of the family from Mrs. Gaskell's biography and from many unpublished manuscripts. Mr. Shorter also has in hand a life of George Borrow.

A volume of selections from the addresses of Attorney-General Bonaparte is in preparation. The book will be arranged so as to offer a fairly connected account of the Civil Service Reform movement, Indian affairs, and other public interests with which Mr. Bonaparte has been connected. It is understood that a publisher has not been selected, although a considerable part of the material is prepared.

An interesting and comprehensive contribution to the history of modern Japan will be the volumes edited by Count Okuma, covering the last fifty years of the empire's development. The Japanese edition, now in the press, is to be ready this month, and the English issue, translated by Capt. Brinkley, is to be brought out by the London *Times* a few weeks later. The book, which includes among its joint authors some of the greatest scholars and statesmen of the country, has evidently been written with a view to removing misrepresentations about Japan, that have found currency in foreign lands. The Japanese edition will comprise a volume of about 2,000 pages. Among the contributors is the aged Prince Keiki Tokugawa, the last of the Shoguns, who will relate his reminiscences as the hero in those exciting events that led up to the restoration of the Mikado to supreme power, and the throwing open of Japan to the outside world. Count Okuma himself writes a chapter involving a thorough examination of education in pre-Restoration Japan, adding also a concluding résumé of the special lines of progress that characterize the growth of Japan during the last half-century. Prince Ito, father of his country's Constitution, is to deal with that document; and the Marquis Matsukata, capitalist and financial adviser to the present government, discusses finance. Prince Yamagata, another of the Genro, or Elder Statesmen, the creator of the conscriptive system that so effectively democratized Japan's army, is to treat military growth and equipment. Admiral Count Yamamoto, one of the heroes of the late war, is to recount the phenomenal expansion of the Japanese navy. Doubtless one of the most interesting chapters will be that in which the collaborators are Count Itagaki, Professor Ukita, and the editor in chief, on the subject of Japan's political parties. Viscount Inouye, to whose industry the development of railways in Japan is largely due, will contribute his views on this subject. Education during the Meiji era, *i. e.*, during the last forty years, will be dealt with by the Marquis Saionji. Baron Shibusawa, who stands preeminent among Japan's bankers and merchant princes, writes on Japanese banks and commercial companies. Two representatives of Christianity, Bishop Honda and Mr. Yamaji, will relate the progress of that religion, and take up Japanese history from a moral and ethical point of view. One foreigner, Dr. Baelz, a German professor of medicine in the Imperial University, Tokio, deals with the subject of Japanese physique. That this subject should claim a separate chapter and special treatment is significant of the definite and detailed manner in which Japan is devoting attention to every phase of life that bears on her efficiency as a world-power, even to the extent of practically undertaking to increase the defective stature of the nation.

"Who's Who" for 1908 comes to us from the Macmillan Company, the most welcome reference book of the year. The number of biographies continues to increase, bringing the pages up to something over 2,000. The names included are of necessity chiefly British, but it differs from "Who's Who in America" and "Wer Ist's" in extending its hospitality to a considerable number of foreign persons. England, America, and Germany are now well provided for; there is pressing need for a volume devoted to celebrities of the Latin countries.

"Canada as I Saw It" is the title of a series of letters by W. Redwood, first written for the Bristol (England) *Western Daily Press*, and now republished in neat book form (Bristol: Reid), with illustrations by S. J. Loxton, a British artist. The volume covers some 15,000 miles of travel in the summer of 1907, when Mr. Redwood went out to inspect Canada with the Dominion government press party. There are a discussion of the Asiatic question in British Columbia, an investigation of irrigation and traffic, a statistical review of the general development of the country, and an inquiry into the possibility that the Dominion may some day supply all the grain required by Great Britain.

"Holland Sketches," by Edward Penfield (Charles Scribner's Sons), contains some very charming fragments of Holland done in color, albeit the choice of subjects shows the mere accepted conventionalities of the artist's Holland—nay, of the picture post-card Holland even. The Amsterdam orphan in her bi-colored dress, suggestive of a checkered career in life, the great patched sails, the Marken fishers, and the windmills are typical features almost as familiar as national flags. But these are not all. The Café Spaander is more novel, and so is Taking Toll, which shows, in delightful rich browns, a skipper lowering a wooden shoe to the tollman, as a convenient receptacle for the few stuivers due for the transit of the *Boeier* through the lock. The Shoeshop, too, has an original touch. The letterpress accompanying the artist's work is pleasant enough, but slight in scope, merely the words of an observing passerby. Only one wonders a little over the pretty little tale of "A Christmas in the Café Spaander." Can it be really true that it is *Christmas* that now rouses the expectations of the Holland children? Have the little peasants forgotten the Day of St. Nicholas as their gift-tide, when their own Dutch Santa Claus was wont to fill the wooden shoes of all orthodox lads and *meisjes* whose Calvinistic progenitors instituted December 5 as a Protestant substitute for Christmas identified with the Church of Rome? It looks so, if this pleasant picture of the benevolent artist, whose Christmas gifts compensated for a bad fishing season, be a true impression of his view of winter Holland.

Uniform with "Castles and Chateaux of Old Touraine" and "Castles and Chateaux of Old Navarre," both by Francis Miltoun, L. C. Page & Co. publish "The Castles and Keeps of Scotland," by Frank Roy Fraprie. He has "tried to bring together some of the history and romance which attach to the more important castles of Scotland, and to tell enough of their architectural peculiarities to enable the visitor to understand what he is viewing." The plans and illustrations, more than fifty in number, are excellent. Many are reproduced from photographs, and some are colored.

The Clarendon Press adds to its Tudor and Stuart Library "Shakespeare's Sonnets and A Lover's Complaint," following the text of 1609, with an Introduction by W. H. Hadow. The editor takes a ground mediate between those who make of the Sonnets a bloodless allegory and those who interpret them as an exact transcript from life. He is willing to admit the reality of a triangular relationship and the two loves. The man he holds to be William Herbert and he accepts the now pretty well exploded theory that Mary Fitton was the woman implicated. So far the Sonnets follow facts. But, in Mr. Hadow's opinion, it is impossible that any man, even Shakespeare, could have shown the forbearance of the first scene, or could have sunk to the degradation of the second. As a dramatist, Shakespeare has simply taken the emotions given him by his friendship and his love in rivalry, and carried them out to their ultimate terms. The theory is ingenious; but, one asks, if, as Mr. Hadow asserts, it is impossible to believe that the events took place as they are here depicted, wherein lies their dramatic justification? Mr. Hadow thus, unconsciously, undermines the value of the Sonnets as poetry, while trying to save the character of the poet. The typography, we may add, makes this one of the pleasantest of editions of the Sonnets to read for those who like the old spelling.

The quarterly instalment of the "New English Dictionary" (Henry Frowde) has promptly appeared—a triple number giving 5,726 words (Polygenous to Premious). Dr. Murray begins, in fact, where he left off last April, and courageously reaches daylight after traversing the jungle of words compounded with Poly-; but somehow President Eliot's coinage of Polydenominational, applied to the Harvard Divinity School in his last Report, has been omitted. Born too late for last April's issue, and excluded from the present number by what may be called the lexicographical precession of the alphabet, this sesquipedalian rarity has fallen between two stools and must wait for some future appendix. A survey of the introductory articles in this number on Pre- and Post- and on Poly- in its predecessor shows how very recent are most of these unrefreshing compounds. Indispensable for scientific exposition, their multiplication threatens nevertheless to muddy the stream of English undefiled. Thackeray, for instance, spoke in a jocular vein of Præ-railroadites, but then came George Eliott, who fails, even with alliteration's artful aid, to excite our mirth when she speaks of old portraits stretching back "to the pre-portraying period." Old English words will not nest in these thickets of many-syllabled profusion. Among the 16,486 words in the first four instalments of the letter P, only four are genuinely Old English; this section and its predecessor show more of them, but still relatively few when all are told. The bulk of words under P is a comparatively recent accretion, and one which must always be contemplated with mixed feelings. In this number the vast majority of sound monosyllabic vocables derive through French from Latin, as Preach, Praise, and Pray. Through Latin in turn came several important Greek words, as Pomp and Practice. A most instructive group of articles are those on Post^2 and its derivatives, where a history of the modern postal system from the sixteenth century onwards is spread before us. Curious lore is also given under Pound, Potato, Polynesia, and Pomander, though the relevance of the title, "The Divine Pymander of Mercurius Trismagistus" (1650), instanced to exemplify the figurative use of Pomander as a book of prayers or secrets, is perhaps open to question.

The name "Modern Studies" does not indicate the full scope of Prof. Oliver Elton's book recently published by Longmans, Green & Co. The second half of the volume is, to be sure, made up of essays on Tennyson, Swinburne, George Meredith, Henry James, and "Living Irish Literature," but the medial essays on "Recent Shakespeare Criticism" and "The Meaning of Literary History" deal only in part with modern interpretations of old themes, and there still remain the papers on "Giordano Bruno in England," "Literary Fame," and "Color and Imagery in Spenser," which are almost purely antiquarian. Perhaps it is not fantastic to find the title significant of the two influences of modernism and scholasticism which have come together in Professor Elton's work. In Walter Pater, for whom Professor Elton has evidently a warm admiration, those two currents were thoroughly mingled. The scholastic study was there, but showed itself only in the illusion by which Pater's hedonistic modernism was made to masquerade as resuscitation of past modes of life. In Professor Elton's writing the two currents run rather side by side. Thus we begin to read in the "Spenser":

> Without the similes, the world of the "Faerie Queene" would be vaguer and more lifeless. It is full of the sound of running waters, and its ovals of faint sunshine are tempered by the forest branches.

That is pure Pateresque, but there follows an analysis of Spenser's metaphors very interesting in itself, but of the professorial notebook character. So with the "Shakespeare," which opens thus:

> The Germans like to tell of the *Nachleben* of Shakespeare, or that strange after-life of his in the industry of others, upon which his shade is silent.

That, again, has the note of Pater's modernism; what follows is a thoroughly keen discussion of the Shakespearean criticism of Brandes, Bradley, Churton Collins, and Walter Raleigh. Especially the summary of Professor Bradley's "Shakespearean Tragedy" will be welcome to those who have found some difficulty in grasping the philosophy of that remarkable book. Among the studies of recent writers, those on Tennyson and Henry James will probably be the most generally acceptable. The essay on James is particularly subtle, ending with this vivid bit of criticism:

> He is one of those who show life and living things under a microscope. The life is real enough, and yet unlike the reality we know. It is unlike the reality achieved by poetic insight and poetic glamour, while partaking of it because it is also a work of the constructive imagination. The effect of this *over-reality*, if it may so be called, is a kind of bewilderment and mirage. But the art is deep and real, and it also is founded on the watching of humanity, on the author's immersion in the fates of humanity.

Altogether, this is a book of erudition and insight, although its materials are not always fused into complete uniformity.

In our notice of Prof. Lane Cooper's "Theories of Style" (*Nation*, January 9) the words "One may feel that J. Addington Symonds's three essays on style should not be totally neglected," are not quite precise. Symonds is listed in the Bibliography, although passed over in the selections that make up the text.

The *American Journal of International Law* for October has just appeared. The delay is explained by the fact that the managing editor, Dr. James Brown Scott, solicitor of the State Department, has been abroad as a representative of the United States at the Hague Conference. The number opens with a paper by Dr. Scott himself, "The Legal Nature of International Law." It is a trite saying that in the main that branch of the law lacks the sanctions which render municipal law effective: that autonomous states in the "concert" are theoretically equal, and, however potent public opinion in an international sense may be, one of those states may refuse to conform unless other nations coerce it. Dr. Scott recognizes this condition, but is most concerned with the fact that those nations, such as England and the United States, that regard the precepts of international law as part of their respective systems, find no difficulty in enforcing decrees based on those rules. Numerous decisions of English courts have definitely carried into effect principles of that branch of the law; and in that respect our United States courts, since the days of Marshall, have followed English precedents. The author is able to cite Jefferson and Hamilton, who disagreed on so many points, as agreeing that the law of nations makes, as the former puts it, "an integral part of the law of the land." Gaillard Hunt, in a paper on the "History of the Department of State," traces the origin of the department to the Committee of Correspondence of Revolutionary days. Wilbur J. Carr, in writing on "Our Consular Service," sets forth the present status of that service, and emphasizes the value of a recent executive order, which imposes new regulations affecting admission into the service, and promotion when once in it. There is also a paper on "Citizenship and Allegiance," by Prof. W. W. Willoughby of Johns Hopkins. The "Editorial Comment" includes "The Integrity of China, and the Open Door," and "The Recent Anglo-Russian Convention Relating to Persia." This number of the new quarterly completes its first year. There are nearly 1,070 pages, and a supplement of 430 pages more of important documents—treaties, conventions, etc. For publicists, historical students and teachers, and jurists, the publication should be very valuable. (New York: Baker, Voorhis & Co.)

The twelfth volume of the "Political History of England," by Sydney Low and L. C. Sanders, covers the reign of Queen Victoria (Longmans, Green & Co.). Although it is hardly equal to the best volumes of the series, one notes with pleasure that the authors have not followed the precedent set by the last volume reviewed in our columns. Whereas Bacon's "Novum Organum" received but one line, and Shakespeare less than three, Darwin's "Origin of Species" gets half a paragraph, and Tennyson and the Brownings three pages. As in former volumes, the exclusion of economic questions mars the general outline presented, and leaves a somewhat one-sided impression.

"The Cotton Mills of South Carolina, 1907" (Charleston, S. C.: Daggett Printing Co)., consists of some thirty-odd letters written to the Charleston *News and Courier* by August Kohn. Five years ago Mr. Kohn prepared a series of articles on this subject for the *News and Courier*, but in the meantime the industry has developed largely; and he now presents a fresh survey of the field. His 225 closely printed pages exhibit, of course, the defects as well as the virtues of daily journalism. Three-fourths of the capital invested in manufactures in South Carolina are in cotton mills—a fact which indicates the importance of Mr. Kohn's field of investigation. He describes the various mill towns, the social and economic conditions, the status of child labor, and the details of "welfare work"; he discusses such topics as wages, cost of living, health of the operatives, their morals, their religious opportunities, "the little pleasures of life," and the labor supply. His conclusions are in many cases fortified by tables of prices of provisions, rent, the pay of various grades of operatives, and statistics of disease. He also goes into the capitalization of the mills and the profits of the enterprise, and the effect of the mills on the communities in which they are situated. In some instances—as regards health and morals, for example—exhaustive and accurate figures are in the nature of the case unobtainable. Nevertheless, his observations may be accepted as the best judgment he could form from the data within his reach.

The Harvard Studies in Classical Philology for 1907 (published by the University) offer as the leading article a study of logaœdic metre in Greek comedy, in which Prof. John Williams White, following Hephæstion, writes a palinode to the "abhorred" antispast whose name he never mentioned in the little treatise of 1878 on Rhythmic and Metric; by the same authority, he reinstates the choriamb as a fundamental foot. In studying ancient music and rhythm our questions should be: Was the metrician competent? Did he understand his subject? What did he really mean? When we have seized his meaning, it is our business to explain and expound it in terms of modern music. This is the sensible dictum of Henri Weil so long ago as 1872, which Professor White appears to approve. Greek rhythm, he remarks, was a highly developed art. That being the case, it is better to sit at the feet of the ancient authorities than to approach the subject with modern prepossessions. In a paper of decided literary charm and good sense, Arthur Alexis Bryant discusses "Boyhood and Youth in the Days of Aristophanes." At this period, apparently, the state did not preëmpt two years of a young man's life for military service in that Ephebic College which Aristotle describes; there is no evidence, in fact, that the state concerned itself with any part of the boy's training from the cradle to manhood. The concluding paragraph refers to the gracious and untroubled leisure of the slave-holding Athenian—a type now hardly imaginable—his life of political interests and service to the state, devoted to friendship and hospitality, his days of talk in the agora, his Attic Nights, not absolutely unlike the symposia of Plato and Xenophon. This disquisition, the learned, seamy side of which appears in the notes, might well be decanted into that occasional volume for exoteric readers which we petitioned for a year ago. Cleasby, in his analysis of the "Medea" of Seneca, endeavors to assign what is due respectively to Ovid and what to Seneca's own invention. To Seneca alone belong the incantation act, and the scenes between Medea and her nurse; to Ovid, the brilliant idea of introducing the wedding chorus; the gradual possession of Medea by a mænadic frenzy, and the "startling innovation" of the actual murder of the children in their father's presence and before the eyes of the spectators. For the sophistical *dicanic* argument of Euripides, Seneca substituted "flamboyant Roman rhetoric." Arthur Searle outlines a plausible scheme of the battle of Pharsalus. The laborious investigation of Arthur Patch McKinley with regard to the chronology of the work of Boethius, and the stylistic tests he has collected, however interesting and important, do not admit of convenient summary; the same may be said of Ernest Cary's study of the manuscript tradition of the "Acharnenses."

After an interruption of two years B. G. Teubner's well known "Philologischer Katalog" has again made its appearance, in the edition for 1907. It covers the bibliography of the following subjects: General Science of Language, Modern History, Science of Religion, Geography, Ethnology, Economics, Political and Legal Science, Universities and Education. The new publications of the past two years have been added to each department. A new feature is the *Illustrierte Anhang* containing a selection of extracts from prominent works dealing with classical antiquity, together with tables of contents and specimen pages.

The edition of the Greek Commentary on Aristotle's work, which the Berlin Academy of Sciences has had in hand for several decades, is brought almost to completion by the large volume, No. VIII. in the series, prepared by Prof. K. Kalbfleisch of Marburg, and containing the Commentary of Simplicius on the Aristotelean Categories. The only part yet lacking, namely Philoponus on the "Analytica Posteriora," is already in press. The whole will be one of the most splendid critical editions of any Greek text ever printed, extending to fifty-one parts in twenty-three volumes, together with three supplementary volumes. It is particularly gratifying that the father of the whole collection, Prof. Hermann Diels of the Berlin University, together with his chief assistants, the philologians Hayduck and Wallies, have been able to see the completion of this *magnum opus*.

In the Imperial budget of Germany for 1908 30,000 marks are appropriated for work on Grimm's "Wörterbuch." The *Tägliche Rundschau* of Berlin declares that if a like sum is appropriated regularly, as will doubtlessly be done, the undertaking will be completed in about fifteen years and will discuss about five hundred thousand words.

In "Erlebtes und Erstrebtes: Reden und Aufsätze" (Munich: C. H. Beck) Oskar Jäger, a Nestor among teachers and writers on pedagogical subjects in Germany, gives in twenty-six essays and addresses the fruit of his experience. The first half bears the summary title "Erinnerungen und Gelegenheitsreden," and the second "Schulreform und Verwandtes." Practically every phase of educational discussion in recent decades is here considered.

A national association, the Kepler-Bund, composed largely of scientists, has been formed in Germany under the presidency of Dr. Philipp Zorn of the law faculty of Bonn. The avowed purpose is to demonstrate that the position taken against the teachings of Christianity by the philosophy of monism, as voiced chiefly by Prof. Ernst Haeckel, the zoölogist of Jena, and by the Monistenbund, organized some months ago for the purpose of instituting a monistic religious cult to take the place of Christianity, are for scientific and not for religious reasons to be rejected. This organization is largely the outcome of an agitation begun by Prof. E. Dennert, botanist of the pedagogical institute in Godesberg, near Bonn. In a membership of some seven hundred persons, including members of the philosophical, law, and medical faculties of Berlin and other universities, there are only thirty theologians; and in the executive and editorial committee of thirty there are only two theologians. The Kepler-Bund proposes to meet monism theoretically and practically, and expects to demonstrate that even the strictest application of scientific principles to the investigation of nature will not result in a scheme antagonistic to the leading principles of Christianity.

A posthumous work of the late Prof. Otto Zöckler of the University of Greifswald has been issued by Bertelsmann, Gütersoh, entitled "Geschichte der Apologetik des Christentums."

A new work, entitled "Unsere religiösen Erzieher," edited by Prof. B. Bess (Leipzig: Quelle & Meyer), gives from the pens of recognized scholars a collection of biographical studies of leading agents in the development of Christianity from the time of Moses to the present day. Vol. I. selects nine prominent characters; Vol II., eight.

The publishing house of Eduard Trewendt of Berlin announces as forthcoming an extensive series on Bismarck, his times and work, entitled "Geschichte des Fürsten Bismarck in Einzeldarstellungen," consisting of small-priced volumes of about 300 pages each, the whole to be completed in about five years. The editor is Johannes Penzler of Leipzig, but the names of fully a dozen other scholars have been announced as collaborators.

In Dr. R. Schmidt's "Fakire und Fakirtum im alten und modernen Indien," recently published by Barsdorf in Berlin, we have an interesting series of investigations concerning fakirs in India and the marvellous performances, for which these ascetics and religious mendicants have become famous. The book is based to a considerable extent on the research of the Oriental scholars Prof. Ernst Kuhn of Munich and Prof. Richard Garbe of Tübingen, which the author has utilized in connection with his own investigations. One of the most noted feats of the fakirs is to be buried alive and after forty days to be restored to life. Europeans are inclined to regard this act as a farce and fraud, but in the view of Dr. Schmidt so many cases of it have occurred under the direct supervision of governmental officials, both native and English, as to render this explanation impossible. Popular opinion in India, on the contrary, accepts the wonderful phenomenon as something supernatural, the manifestation of superhuman powers acquired by a holy life. In general the fakir himself does not claim a miraculous character for such exploits, as is evident from Dr. Schmidt's description of the means employed by him for their accomplishment. Thus in a case at Amritsar in the presence of the minister in Derbar the fakir lived on milk for three days beforehand and after a complete evacuation of the bowels by cathartics stopped the nose, ears, and all other apertures of the body with wax. Then after drawing his breath he fell down, closed his eyes, and was apparently dead, his whole body becoming cold except one spot on the crown of his head, which was burning hot with strong pulsations of the blood. He was placed in a coffin and buried in a grave expressly prepared for him in a small house, which the minister caused to be built for this purpose. Grains of wheat and rice were sown on the grave, the door of the house was locked and sealed, and guarded by sentinels, who were changed every two hours. On the fortieth day the grave was opened and the body was found in precisely the same position and condition as it was when first placed there, only the skin had grown more yellowish. The servant of the fakir, in accordance with his master's instructions, now began the process of revivification. First he laid a thick piece of newly baked bread burning hot on the top of the fakir's head, which in that spot showed the same degree of heat as at the time of his burial. Then the limbs were vigorously rubbed or massaged and the wax removed from the apertures of the body. No sooner was this done than the fakir opened his eyes and recovered his senses and after a hot bath his vitality was wholly restored. Dr. Schmidt treats the subject from every conceivable scientific point of view, physiological, autohypnotic, and climatic, and suggests an analogy between the apparent death of fakirs and the hibernation of animals.

The management of the Weimar Nietzsche Archiv has received from the director of the Museum of Arts in Stockholm, Dr. Ernst Thiel, the munificent sum of 300,000 kronen. Personal friendship for the Nietzsche family is declared to have prompted Director Thiel to make this gift.

Prof. Karl Vossler, who holds the chair of Romance languages in the University of Heidelberg, has begun the publication of a scholarly investigation of the "Divine Comedy" of Dante, entitled "Die Göttliche Komödie: Entwicklungsgeschichte und Erklärung." So far only Band i. of Teil I. has been issued by Karl Winter, Heidelberg, in a volume of 265 pages (5 marks). This contains only the first half of a history of the development of the "Divine Comedy," which is to be discussed from the religious, the philosophical, the ethico-political, and the literary points of view. The commentary proper is to appear in two, and possibly three, volumes.

To those, if there be such, who still cherish the British and German superstition that France has no poetry, we recommend "The Oxford Book of French Verse," edited by St. John Lucas and published by Henry Frowde. There are qualities that will be missed in these pages—the characteristic gravity of English at its best, the *Gemüthlichkeit* of German, the Oriental richness of Spanish—but from the "Belle Éremhor" of the twelfth century to the "Sagesse" of Verlaine in the nineteenth here is a stream of melody and grace, of *gaulois* humor, sly wit, and pathetic revery which may stand beside the anthology from any language. For our own taste the editor is too much in the thrall of the old romantic exclusiveness. Half the volume is given up to the nineteenth century, Victor Hugo and especially Alfred de Musset holding a predominance out of all proportion. The eighteenth century, with the exception of André Chénier, receives even less space than it deserves, and the great classical poets of the seventeenth, again with the exception of La Fontaine, are treated with scant courtesy. At least one extract is admitted from the plays of Corneille; after such an admission it is hard to understand why Racine should not be represented by some of the superb choruses from "Esther" and "Athalie" and even by one or two of the notable passages from his dialogue. Granting, however, this strong romantic predilection, we have only praise for Mr. Lucas's taste and scope. He has made a volume to read and to keep.

The National Society for the Promotion of Industrial Education will meet at Chicago, January 23-25. A long programme of addresses is announced for the public dinner and meetings, among the speakers being Charles W. Eliot, president of Harvard; Edgar E. Clark, member of the Interstate Commerce Commission; James M. Van Cleave, president of the National Association of Manufacturers; Henry S. Pritchett, president of the Carnegie Foundation; Carroll D. Wright, president of

Clark College; James O'Connell, president of the International Association of Machinists; J. F. Deems, general superintendent of motive power of the New York Central lines; E. P. Bullard, president of the Bullard Machine Tool Company; Horace F. Deemer, justice of the Supreme Court of Iowa, and Miss Jane Addams of Hull House.

Special interest attaches to the annual report, just issued, of the San Francisco Public Library for the year ending June 30, 1907. Of the entire system, numbering April 1, 1906, 166,344 volumes. there were left after the fire only 27,976 volumes. The destruction of the central library was complete, every volume disappearing in the flames. Of the six branches, two were completely destroyed, and two others severely injured. The work of restoration began with the two injured branches, which were soon put in condition for active service, so that for the greater part of the year four branches were in operation. Work was immediately begun on a temporary structure for the central library, and this building is expected to be ready for occupancy this present month. During the past year, 22,377 volumes were added to the library, and 5,802 were withdrawn or lost, making a net gain of 16,575. These, with the remnant left by the fire, made a present total of 44,551. For the next five years at least it is proposed to spend $25,000 a year for new books. The circulation for the year was 349,646 volumes, which compares with a circulation of 830,225 for the year ending July, 1905, the last complete year before the fire. The registry of borrowers now shows 19,822 card-holders, somewhat less than half the number registered before the fire.

Library conditions in Maryland, as set forth in the last annual report of the State Library Commission, appear rather discouraging, in spite of the remarkable development of library work in Baltimore. Not only the small towns and villages, but even the larger towns and cities, are reported, with few exceptions, as lacking in proper library facilities. Some aggressive work for library extension during the year is reported, the principal agencies used being a "field worker" and a system of travelling libraries. The field worker devoted his attention chiefly to the Eastern Shore, where during a stay of two months he visited thirteen towns, and organized six new library associations. Through the travelling library system, consisting of eighty-three libraries of thirty-five volumes each, forty-five towns were reached by the Commission, and seventy-nine cases of books circulated.

The summer course of the New York State Library School is to be enriched this year by including, in addition to the general elementary course heretofore offered, three special courses: (1) Reference work, to be given in May, by J. I. Wyer, jr., formerly librarian of the University of Nebraska, and now vice-director of the State Library School; (2.) Book selection, in June, under the direction of Miss Wheeler, bibliographer in the State Library, and compiler of the annual "Best Books" lists; (3) Library work with children, in June, by Miss Hunt, superintendent of children's work in the Brooklyn Public Library, and Miss Olcott, director of the Training School for Children's Librarians in the Carnegie Library of Pittsburgh. Both the regular and special courses of the Summer School are open only to those holding paid library positions, or those under definite written engagement to such positions. No charge for tuition is made to those engaged in library work in this State.

The New York Library Association will hold its next annual conference at the Sagamore Hotel, Lake George, September 21 to 28, 1908.

The Rev. Edgar Sanderson, a writer of popular history, died in England, December 31, in his seventieth year. His "History of the British Empire" has run through twenty editions. He was also author of "The Creed and the Church."

Holger Drachmann, the Danish poet, died January 13, at Hornbach. He was born in Copenhagen in 1846, and was educated at Copenhagen University and the Academy of Fine Arts. He studied marine painting from 1866 to 1870, and achieved considerable success as an artist. In his later years, however, he devoted his energies chiefly to literature. Among his books are "Poems." 1872; "Muffled Melodies," 1875; "Young Blood," 1876; "Songs of the Sea," and "Over the Frontier There," 1877; "Tendrils and Roses," "On the Faith and Honor of a Sailor," "Paul and Virginia," and "Lars Kruse," 1879; "East of the Sun and Moon," 1880; "Chrysalis and Butterfly," and "Don Juan" (a translation), 1882; "Strandby Folk," 1883; "Once Upon a Time," 1885; "Volünd Smed," "Brav-Karl," "Melodramas," and "Gurre," 1899; "Daedalus" and "Hallfred Vandraadeskjald," 1900.

A SERVANT OF THE IDEAL.

The Reminiscences of Carl Schurz. Illustrated with portraits and original drawings. 2 vols. New York: The McClure Co. $6 net.

That the most important book of the past year in autobiography, if not in all biography, should prove in some measure disappointing, is not the fault of the autobiographer. The blame must be distributed among the publishers, the translator of the earlier parts, and the editors.

For the chief disappointment the publishers are responsible. They have so announced these two volumes as at least to permit purchasers to suppose the work complete. As a matter of fact, the second volume closes with an account of the battle of Chancellorsville, leaving Schurz only thirty-four. The record of those years, as written by himself, is a fascinating story. But the story of the forty-three years that were still to follow could hardly be less interesting; and it would have an even greater value, since it would throw light upon events and men that are not yet so well understood as those which are here dealt with. We are not told how far beyond 1863 Schurz had progressed with his narrative. It is known, however, that he did not stop with Chancellorsville—or even with Appomattox. There is reason to believe that he had at least begun to write about Grant's Administration. Perhaps we may hope, therefore, to have from his pen accounts of the men of that period—Grant, Conkling, Blaine, and the rest—as illuminating and convincing as the characterizations we now have of the many remarkable personages—German, Italian, English, and American—whom he encountered in the earlier half of his career.

The translator of the earliest portion of these reminiscences, which, because it is concerned with Germany, Schurz preferred to write in German, has not, in fact, done her work so badly. But German, as Schurz himself has occasion to point out, does not translate into English so readily as English into German. There are too many sentences that keep the German idiom. One cannot help regretting, therefore, that a man who had attained such exceptional mastery of both languages should have permitted his German to be turned into any English but his own.

The editors have been wise in not attempting to rewrite anything, although, as they tell us, Schurz merely set down his recollections as they came to him, following only a loose chronological order; and he would certainly have revised the whole carefully had he lived. It is best to keep what he wrote as he wrote it. But the decision not to revise is hardly an excuse for careless proofreading; and of this there are so many signs that it would be useless to begin enumerating them. When the still unpublished reminiscences are ready, the whole should be edited again by some practised hand.

But we must not dwell too long on minor imperfections of so entirely desirable a book. As one grows older, it is books like this—the records of interesting and admirable lives, preferably in autobiographical form—to which one turns for the pleasure which even the best novels no longer seem to yield. Not only had Carl Schurz an uncommonly interesting and admirable life to relate, he had also uncommon qualifications for the task. He had a gift of strong, clear statement, which he did not lose when he passed from the German to English—a disturbing transition, he confesses; for when he first went to England he thought the language quite the strangest and most difficult he had ever heard. He had a good narrative instinct. He had made such an early plunge into affairs, and come so soon into intimate association with leading men and intimate knowledge of the springs of important happenings, that his judgments possess, almost from the first, the quality which only experience can give. He had a sense of humor. He had a German heartiness which gives to his recital of things seen and done the same kind of zest he had in seeing and doing them. Yet he had also the keener and more delicate appreciations of an artistic temperament; for he was himself a musician of no mean attainment, and he cared intelligently as well as intensely for what is best in the other arts. Above all, he was an idealist, and could give to all he tells the charm which only idealism can shed upon men and things.

That, indeed, is the distinctive note of these volumes, as it was of the man's whole life; and the lesson and heartening from it all is nothing more or less than another demonstration of the great practical effectiveness of persistent idealism. For persistent it was, to an extraordinary degree, and of a toughness that kept it alive through countless disappointments with the very great world which Schurz inhabited. The first photograph—of the student at Bonn, nineteen years old, spectacled, dreamy-eyed, long-haired, trustful—holds no great promise, one might say, of any practical achievement. It would have been easy, one fancies, to set this youth down as a "mollycoddle"—if the school of achievement by compromise had possessed at that day such an epithet. Moreover, Schurz confesses that he had little relish for duelling bouts—the chief recreation of those German students who would most dislike to be called "mollycoddles"—and even less for their drinking bouts. Yet the dreamy-looking young fellow was hardly a year older when he made his skilful escape from the doomed fortress of Rastatt; he was not two years older when, from his exile in Switzerland, he boldly made his way across the German frontier, penetrated to Berlin, and effected the daring rescue of his fellow revolutionist, the poet Kinkel. The face of the old man of seventy-seven, who, in the frontispiece, sits in his study in New York—the picture of his youthful self and Kinkel hanging suggestively in the background—is not quite so dreamy and trustful. It has not entirely escaped an expression that may be thought world-weariness. But if one doubts whether the old fighting idealism was still there, one has only to read a certain trenchant pamphlet, "The Two Roosevelts," which will probably remain the best literary reverberation of the one-sided campaign of 1904.

These earliest and latest episodes of Schurz's public career in his two countries may well stand for what came between. The first showed that he had the courage to stick to his ideals with an unfaltering loyalty; the second, that he was no blind enthusiast, but could discriminate, and that he had also that highest type of civic courage with which a man breaks the ties of party, even of friendship, to pursue the course he thinks is right. The first kind of courage made him merely a brave fighter in good causes. The second kind made him a guide and leader of other men's consciences. His life-long distinction lay in precisely those changes of party which drew on him the wrath of such men as Blaine. In that, and also in an uncommonly various ability.

It is always necessary, no doubt, to be cautious about accepting a man's own version of his deeds and his motives. In a certain portion of these reminiscences—that, namely, which recounts Schurz's part in the Civil War—we have, in fact, been occasionally moved to suspect that he had come to feel too sure, not indeed of the courage and devotion, but of the skill and competence, which he displayed. It is a little strange, for instance, that he, a civilian general, should at Chancellorsville have seen so clearly, from the very first, the true character of Stonewall Jackson's famous march, and foreseen so clearly its overwhelming results—if the movement was, in fact, the consummate stroke of military genius which friends and foes have usually accounted it. But the tone of the whole is far from being vainglorious. On the contrary, it has the good taste in modesty which forbids insincere self-depreciation. As a rule, the facts and motives are given simply, straightforwardly, and left to speak for themselves; and we believe that in the matter of accuracy the narrative will stand well enough the test—which we have not space to apply here—of a comparison with other men's recollections, and with the official records, and with the formal histories.

The contribution which it makes to the historian's material is not insubstantial because it happens to be so acceptable in form and in human interest. Here, particularly, is an invaluable collection of portraits of famous people, beginning with the German revolutionists of 1848, and ending with the American statesmen and generals of 1861-1865. It is interesting to observe how considerable a number of the first group belonged also to the last. Schurz is himself only the most conspicuous representative of Germany's immense contribution to American manhood and American culture. According to one's temperament, one may draw either inspiration or encouragement from the readiness with which the beaten reformers of Europe found in America an opportunity to fight and suffer for the same old cause of human liberty. But Schurz's friendships with European reformers were not limited to Germans. Here are vivid pictures of Kossuth and Mazzini, whom he knew in England, and of the whole remarkable colony of exiles for freedom's sake who gathered in London after the defeat of the various revolutionary movements of 1848 on the Continent; and here, at the very end of Volume I., and at the moment of Schurz's solemn resolve to make America his home, is an encounter, dramatic enough for a novel, with Louis Blanc on a bench in Hyde Park.

For the French, and for Paris, where he spent some time after the Kinkel rescue, Schurz seems to have had an appreciation and sympathy a shade less warm than in the case of most civilizations other than his own. He confesses candidly how revolting he sometimes found the licentiousness of the great French capital. But there is not enough to convict so remarkably catholic a spirit of anything like prejudice; and per contra there is no better word-portrait in the book, and none more seemingly extravagant, than that of the great French actress, Rachel, whom he ventured to go to see in Berlin, while he was there to rescue Kinkel. This is but a part of it:

> But who can describe the witcheries of her gestures and the changeful play of her eyes and features? They in their turn served to make the spoken word almost superfluous. There was, of course, nothing of that aimless swinging of arms and sawing of the air and the other perfunctory doings of which Hamlet speaks. Rachel's action was sparing and simple. When that beautiful hand, with its slender, almost transparent fingers, moved, it spoke a language every letter of which was a revelation to the beholder. When those hands spread out with open palms and remained for a moment in explanatory attitude—an attitude than which the richest fancy of the artist could not have imagined anything more beautifully expressive—they made everything intelligible and clear; at once you understood all and were in accord with her. When those hands stretched themselves out to the friend or to the lover, accompanied by one of those smiles which were rare in Rachel's acting, but which, whenever they appeared, irradiated all surroundings like friendly sunbeams breaking through a clouded sky—a tremor of happiness ran all over the house. When she lifted up her noble head with the majestic pride of authority, as if born to rule the world, every one felt like bowing before her. Who would have dared to disobey when, the power of Empire on her front, she raised her hand in a gesture of command? And who could have stood up against the stony glare of contempt in her eye, and the haughty toss of her chin, and the disdainful wave of her arm, which seemed to sweep the wretch before her into utter nothingness?

Save in the accounts of first hearings of the overture to "Tannhäuser," conducted by Wagner himself, whom Schurz had known as an unpopular fellow-exile in Switzerland, and of a performance of "Parsifal" at Bayreuth, one does not find such raptures anywhere else in the book.

It is the European reminiscences which will prove freshest to most Americans. It is they, also, which bring into the clearest light the side of Schurz's own character which Americans are most likely to ignore—his wide culture, his cosmopolitan interests and point of view, his versatility. They make all the better reading because they transport one to scenes with which most travelled Americans are familiar—the Rhine country about and above Cologne, Switzerland, Paris, London, and later on, during Schurz's ministry to Spain, Madrid.

The Spanish mission, brief as it was, must yet be accounted one of the chief episodes of Schurz's career. For from Madrid he sent to Seward the now famous letter in which he urged that the best way to win over European public opinion to the Union cause would be to make that cause distinctly the cause of freedom against slavery. His residence in Spain, taken with his general knowledge of Europe, enabled him to present that view of the situation convincingly—not, indeed, to Seward, who rejected it, but to Lincoln, whom he soon came home to see in person. It is an interesting side light on history which one gets from Schurz's story of that interview:

> I repeated to Mr. Lincoln substantially the contents of my dispatch of September 18 [to Seward]. I did not deem it proper to ask him whether he had ever seen that dispatch, and he did not tell me that he had. But he listened to me very attentively, even eagerly, as I thought, without interrupting me. I was still speaking when the door of the room was opened, and the head of Mr. Seward appeared. "Excuse me, Seward," said Mr. Lincoln, "excuse me for a moment. I have something to talk over with this gentleman." Seward withdrew without saying a word.

Lincoln seemed at least half convinced; and a consideration of the probable effect in Europe undoubtedly helped to hearten him for the several steps against slavery, culminating in the great proclamation, which he took within the year.

For most readers, the interest of the narrative will reach its height in those pages which deal with Lincoln. Schurz had come to know, before 1861, nearly all the foremost political anti-slavery men, for his leadership of the thousands of Germans who went over from the Democratic to the Republican party on the slavery issue made him a man who could not be neglected. Visiting New England, he made friends also with most of the men—Lowell, Longfellow, Whittier, and the rest—who fought the literary battle against slavery. With Longfellow, he became particularly intimate. A good evidence of his perspicacity is to be found in the attention he gives to such comparatively hidden actors in the great drama as the late F. W. Bird of Massachusetts—a man whose devotion and sagacity went chiefly to the making of the more conspicuous careers of other men, such as Sumner and John A. Andrew. Nor did Schurz fail to study closely the leaders of the other side, or blind himself to their strength. One could hardly find anywhere a better brief appreciation of the headlong, unscrupulous force of Stephen A. Douglas, or of the real distinction of Jefferson Davis—men who stood for things which Schurz hated with all his soul.

But the friendship with Lincoln, beginning on the railway train which bore Lincoln to the joint debate with Douglas at Quincy, Ill., in 1858, deserves first place among his intimacies with great men; and Schurz deserves to be set down as one of those who really possessed Lincoln's confidence and probably exerted a real influence on his course. How well he understood Lincoln his well-known brief biography had attested long before the appearance of these volumes. What one now learns is, how well Lincoln knew Schurz, and how highly he valued him.

CURRENT FICTION.

Rosalind at Redgate. By Meredith Nicholson. Indianapolis: The Bobbs-Merrill Co.

For the invention of preposterous but fairly engaging plots the author of "The House of a Thousand Candles" will suffer no loss of reputation through this latest novel. The situation turns upon the all but complete resemblance existing between two young women, cousins, neither of whom has any acquaintance with the other. Rosalind lives with her father, Arthur Holbrook, in the seclusion of a bungalow-workshop beside an inland lake, where, under an assumed name, he has found shelter from some disgrace. Helen Holbrook has come unwittingly with her aunt into this very neighborhood in an attempt to escape from the importunities of her spendthrift father, Henry, who, as it finally transpires, was the real culprit, spared the price of dishonor through a brother's self-immolation. Two lovers of Helen prowl about the scene, scenting danger, baffled by the perversities of her conduct (for they do not dream that she has a double), but at last achieving a happy division of the spoils, quite to every one's liking. There is melodrama and to spare, for the wicked Henry will not be balked in his efforts to get control of a great inheritance, save by the very sight of his forgeries, supposedly destroyed; and in his employ is a sinister Italian sailor, with pistol and stiletto.

Incidentally—for the story is unquestionably the thing—there is some clever character-delineation. Helen's quaint and gentle "Aunt Pat," and the second lover, Reginald Gillespie, a fantastic and whimsical young plutocrat, may be remembered even after the covers of the novel have been closed.

Cupid the Cowpunch. By Eleanor Gates. New York: The McClure Co.

The child is indeed father to the man, and while the staggering infant yearns toward khaki and cap-pistols and the sophomore rejoices to ride red-shirted upon the Deadwood coach, so long will shaps and lariats on the stage and in fiction continue to assure the world that the only genuine triple-distilled American spirit begins—and ends—west of the Mississippi. New England and the South alike have had their day and ceased to be, from the point of view of literary vogue; and possibly fifty years hence the Philippines may be the accepted *mise-en-scene.* In the meantime there is an output of Western romance as boundless as the West itself. Cupid the Cowpunch being his own spokesman, his narrative presents an unbroken front of dialect; but this holds little terror for the delver in the fields of current literature. As one traces the fortunes and misfortunes of Miss Gates's lovable matchmaker, one drifts into pondering on the old question why women so often hanker to write from a man's point of view. Unless a woman is all a genius or half a man, her men are bound to be more or less conventional types; her strength and originality must lie in the portrayal of those she best understands—women. Of course, mind should be sexless; but this axiom comes true only in the case of genius. After all, it is ungracious in these days of ephemeral novels to quarrel with a book that gives us a pleasant hour because it can afford us no more than that. "Cupid the Cowpunch" is clean, wholesome, and amusing—in other words, not commonplace.

The World and the Woman. By Ruth Kimball Gardiner. New York: A. S. Barnes & Co.

Washington is a favorite stamping ground of the tyro in fiction. Here is another novel which quite ruthlessly unmasks the double-dealing, pretence, and petty spite which play so sinister a part in the social life of the capital. To what tricks the upstarts resort in order to surmount the barriers of caste; how patrician ladies, hard put to it financially, must write anonymous articles for a scandal-mongering weekly; how whiskey-and-soda may tempt even a high-minded Senator to reveal State secrets—all this and infinitely more of equal significance may the curious reader find set forth in "The World and the Woman." Nor should the plot go unnoticed. Mrs. Macross, of "cave-dweller" stock, has returned to her native city with the noble resolve to make a happy match for her daughter, Lindsley. Though actually in straitened circumstances, a show of munificence enables her to rent an expensive house and to provide her daughter with all the privileges of wealth. But just as Lindsley is about to give her promise to a young man whom she loves, she discovers the coil in which her mother's devotion has involved them both; and, to prevent disgrace, she accepts an offer of marriage from a worthy and well-to-do old Senator. Young Beauchamp pleads with her eloquently: "Did you ever think," he asks, "what marriage means? There's more to it than a church wedding and a lot of new frocks." At this Lindsley hesitates. Beauchamp has enough money to settle all the family difficulties with ease. True love is victorious. And after the departure of the happy lovers, Mrs. Macross, who—we agree with the author—has "played a great game," seeks out her repentant scapegrace of a husband, always lurking in the background of the story, and begins life over again with him.

That Affair at Elizabeth. By Burton E. Stevenson. New York: Henry Holt & Co.

There is a prevalent impression that the success of a detective story may be gauged by the extent of the reader's mystification. According to such a standard the present novel should rank high. But the plot claims a moment's scrutiny—as a specimen of plot-making. Beautiful Marcia Lawrence, not more than an hour before the time set for her marriage to Burr Curtiss, has disappeared. A note discovered on her dressing-table declares that she has found the marriage to be impossible; that she cannot explain; that no effort must be made to find her. To the aid of the frenzied lover, who has no intention of relinquishing his sweetheart so easily, comes a New York lawyer, Lester, a person already familiar to readers of Mr. Stevenson's stories. Mysteries beset every step of the search; but at last the truth seems to have been brought to light: Burr Curtiss is the son of Marcia's mother by a former and clandestine marriage. Of this fact both mother and son have been ignorant. That Mrs. Lawrence has given so little aid in the search is not due, as Lester naturally supposes, to her possession of this secret, but, it transpires, to the possession of another secret, equally dark, which, for Marcia's sake, she has not revealed. The ultimate revelation of it saves the day: Marcia is not her own daughter, but the daughter out of wedlock of her deceased husband. The curious physical resemblance between Marcia and Curtiss is due to the fact that the father of the one and the mother of the other were brother and sister. Thus all barriers to the union of the severed lovers are removed. It is perhaps excusable to inquire whether, in this conclusion, a rather gross breach of detective-story etiquette has not been committed. If we mistake not, the detective story is a sort of game in which reader and author are pitted against each other. The reader is glad, nay anxious, to be beaten, if so be that the means resorted to are fairly according to the rules. The story-teller must furnish something more than a mere solution; his solution is to possess such plausibility and naturalness that the reader might have hit upon it for himself, had his wits but been sharp enough. But when recourse is had to the unsavory device of two secret misalliances in the same family, it is to the reader's credit if he does not reach the goal ahead of the author. Furthermore, the plot is confused by unproductive side-mysteries and by much cheap writing.

The Jessop Bequest. By Anna Robeson Burr. Boston: Houghton, Mifflin & Co.

A novel may be without especial originality or significance in itself, and yet possess interest as permitting the reader, as he fancies, a peep into the psychic processes of the writer. "The Jessop Bequest" is a case in point. Considering the number of preceding books cited on the title-page, one is somewhat surprised by the youthful point of view of the author—though a certain vernal ardor of iconoclasm may co-exist with much mental labor, if not with any great degree of experience. It is, however, decidedly the hallmark of immaturity to confound Christianity with sectarianism, a fallacy which is so cherished by the author that one is forced to the conviction that she must have known an extremely disagreeable set of Episcopalians. The story shows a wide range of reading—a deduction corroborated by the chapter headings, which are of notable research and ingenuity.

Napoleon's Young Neighbor. By Helen Leah Reed. Boston: Little, Brown & Co.

This book deserves notice, not for its literary style, which is a negligible quantity, but for its sincerity. Written by a manifest admirer of the Little Corporal, it is simply a circumstantial account of Napoleon's life and death on St. Helena. Its superabundance of detail may possess a certain interest for those who prefer their history dished with sauce more or less piquant, but to the general reader it will appear a harmless, unnecessary tale, and its little life be rounded with a sleep.

Förlorade Söner. By Gustaf Janson. Stockholm: Aktiebolaget Ljus.

This is a rather protracted story of two young men, or rather of only one, who developed into a conscious worshipper of Mammon, with a hardness of feeling that does not impress one as natural. Some of the accessory figures are excellently drawn, especially the prodigal's father, and we get an interesting picture of the life among the *honratiores* in a Swedish country village.

Launcelot and Guenevere: A Poem in Dramas. By Richard Hovey. 5 vols.: I. The Quest of Merlin, a Masque. II. The Marriage of Guenevere, a Tragedy. III. The Birth of Galahad, a Romantic Drama. IV. Taliesen, a Masque. V. The Holy Grail and Other Fragments. Along the Trail, Collected Poems. By Richard Hovey. New York: Duffield & Co. $1.25 each.

If we are to accept the statements of the editors and the author's own notes, in addition to the evidence of the poems themselves, Mr. Hovey appears to have had a whole theory or system of the relation of family and state, of love and marriage—in short, the foundations of a new morality, if not of a new sociology, which he was seeking to lay in this series of masques and dramas. Unfortunately in the fragmentary condition of the cycle it is impossible to guess exactly the solution which he had to offer of what is after all the eternal conflict between individual inclination and social obligation. All we are told is that "an evolution of societies, governments, religions, an evolution of material conditions, mental conditions, spiritual conditions was the great groundwork of the 'Poem in Dramas.'" But the general machinery by which this vague and grandiose result was to be set forth, appears rather clearer. In all there were to have been nine plays distributed into three parts, or cycles, each part composed of "(1) a masque, *i. e.*, a musical (operatic) interlude or prelude, foreshadowing the events to follow, dealing with the supernatural elements of the myth and symbolizing the philosophic, æsthetic, and ethical elements of the series; (2) a tragedy; and (3) a play ending with a partial (Parts I. and II.) or complete (Part III.) reconciliation and solution."

What strikes one most forcibly about this scheme and its details, as preserved with a number of fragments in the fifth volume of the series, is its complexity, its extreme ingenuity in contrast with the instinct of a great dramatist like Racine. "What pleased me particularly about my subject," so he was wont to say, "was that I found it extremely simple." In the light of such a sentiment this tortured complication seems but another evidence of the unwillingness of the undisciplined writer to confine himself to the legitimate objects of his art and of his impatience with the great and simple conventions of art as shallow and silly. It is in this way that anomalous and hybrid forms of literature are produced, in the manner of a monstrous and symbolic Egyptian grotesque, like the Helena and the classic *Walpurgis Nacht* of Goethe, who, for all his genius, not infrequently went astray for want of a sound and well diffused critical opinion among his public to correct and restrain his individual errors and aberrations.

Nor is it altogether clear, from what Mr. Hovey had already done, that he was capable of succeeding in a doubtful, ambiguous sort of work, in which a Goethe himself was anything but successful. In his "Songs from Vagabondia," with his friend, Bliss Carman, and in his "Along the Trail" he shows himself as a pretty lyric poet, but a minor one, with a comparatively narrow angle of vision, however cheerful. Nor do the completed parts of his Launcelot show him in a much stronger light. Not only does he fail to realize the most dramatic situations of his fable, partly no doubt on account of his unfortunate philosophical prepossessions; but the best parts of his work are those in which the story has come to meet him, not those in which he has been obliged to meet the story. Much as his untimely death is to be lamented by every lover of verse, it is impossible to consider what remains of his cycle as a great or very significant poem or to believe that even if it were finished, it would be other than a work *manqué* as a whole, a thing of brilliant passages and of splendid promise for the time when the author should have found himself and his own best vein.

The Life of Christ in Recent Research. By William Sanday. New York: Henry Frowde.

This somewhat fragmentary volume may be regarded as a supplement to the article "Jesus Christ" in Hastings's "Dictionary of the Bible," since published under the title "Outlines of the Life of Christ," and also as a series of studies preparatory to a larger undertaking, the "Life of Christ," promised for the International Theological Library. The opening paper, "The Symbolism of the Bible," sets forth in a pleasing and persuasive manner the permanent and vital truths which lie concealed in the imagery of both Testaments, and which, because of their symbolic dress, are likely to remain unnoticed, or even to be discarded, in a prosaic and scientific age. There follows a series of six lectures on recent criticism of the evangelic records, and of endeavors to portray the personality and self-consciousness of the founder of Christianity. This painstaking review of the work of modern New Testament students, principally Germans, is the largest part of the book, and is the most interesting and valuable. Perhaps no volume is so well calculated to familiarize English readers with the results of Continental scholarship in this field. With a sincerity which no one can question, and with the fairness and candor for which he is noted, Professor Sanday discusses the views and researches of Weinel, Steinmann, Schweitzer, Baldensberger, Bousset, Johannes Weiss, Wrede, and Lietzmann, as well as Harnack, Wellhausen, and Jülicher, whose opinions are more widely known.

The gentle Oxford scholar will never be other than orthodox, and his temper is essentially conservative, yet it is evident that he is learning much from German students who are commonly tabooed in England. In this volume he admits a large element of truth in the contention that the teaching and conduct of Jesus were strongly influenced by the eschatological notions of contemporary Judaism. Professor Sanday says:

> I doubt if we have realized—I am sure that I myself until lately had not realized—how far the centre of gravity (so to speak) of our Lord's ministry and mission lay beyond the grave. I doubt if we have realized to what an extent He conceived of the kingdom of heaven as essentially future and essentially supernatural. . . . I doubt if we have appreciated the preliminary or preparatory character of His mission.

This is far in advance of the "Outlines," and while one cannot grant that Professor Sanday quite makes the most of this truth in its bearing upon the interpretation of Christ's teaching and person, the author's present attitude indicates that in the forthcoming "Life of Christ" something more thorough and adequate may be expected than he would have given us a few years ago. Indeed, the present volume contains a clear and manly retraction of the criticism advanced in the Hastings's "Dictionary" article upon the endeavor to determine and analyze the self-consciousness of Christ; the author now says of the attempt "to proceed from within outwards, and not from without inwards":

> So much has been done on these lines that is at once reverent and reasonable, and the result has been such a clear gain in reality of apprehension, that I would not express myself as opposed to it in principle.

This is an important admission, since it indicates at least an inclination toward such a change of method as may result in a more real and vital interpretation of the Christian documents, together with emancipation from some of the dogmatic presuppositions which have hindered historical insight.

It must not be inferred, however, that Dr. Sanday has gone over to what he terms "modern critical liberalism." With all his appreciation of German intellectual honesty and thoroughness of research, he insists that there has been no disturbance of the great landmarks. He is anxious to show that Christ "oversteps the human," and that he was "essentially more than man." His Christology is yet unaffected by the new criticism of whose truth he is persuaded, but it is difficult to see how it can permanently remain so, or how those who follow him in his critical admissions

BURLINGAME PUBLIC LIB.

will remain unchanged in doctrine. We may look with some confidence for further retractions in the more thorough treatise on which he is engaged.

Saint Catherine of Siena: A Study in the Religion, Literature, and History of the Fourteenth Century in Italy. By Edmund G. Gardner. Pp. xx, 440. New York: E. P. Dutton & Co.

This is no conventional biography of a canonized saint, but a study in Italian history centred in the work and personality of one of the most wonderful women who ever lived, the truest and most single-hearted patriot of her age. It is, in fact, a picture of the religious and political life of Italy during the epoch which immediately followed the times of Dante and ended with the Great Schism. In a word, Mr. Gardner has done for St. Catherine what Paul Sabatier did for St. Francis; and we are disposed to believe that, unless new records shall be brought to light, something like the final word on the subject has been said in these pages. Rarely do we find the critical faculty so happily blended with enthusiasm. The book is perhaps the best which has been written about Italy by any Englishman since the death of John Addington Symonds; and indubitably it is the best ever written about St. Catherine.

The range of Mr. Gardner's reading is enormous, and he always prefers to go to the fountain-head for his facts. Not content with the printed letters of St. Catherine, he has studied all the original manuscripts, in Siena, in Rome, in Florence, and in the British Museum, thus discovering a vast amount of unpublished matter which had escaped the notice of previous biographers and editors, matter which throws light upon every aspect of the saint's genius and which has enabled him to correct the hitherto accepted chronological order of her writings and the events in her life to which they refer. Particularly interesting is the chapter "The Beginning of the Schism," where, by the aid of documents existing in the Archivio Segreto of the Vatican, the story of that extraordinary event has been retold with the addition of many new and important details. Yet, in spite of all this learning, the book is never dull, never ponderous. On the contrary, it is by far the most readable life of the saint with which we are acquainted.

The volume is illustrated with photographs; there is an appendix of unpublished letters, and an ample bibliography. The index might, we think, be improved. As it stands at present, it contains only the names of persons.

Science.

The Pulse of Asia: A Journey in Central Asia, Illustrating the Geographic Basis of History. By Ellsworth Huntington. Illustrated. Boston: Houghton, Mifflin & Co. $3.50 net.

The crossing of the great salt desert, the very heart of Asia, and probably the largest uninhabited area in the world, the polar regions excepted, was the most impressive part of Mr. Huntington's journey in Chinese Turkestan. His route was from India through Kashmir to the Tarim Basin, and thence over the ancient Lop-Nor lake bed to the inhabited land in the north. He visited many of the ruins in the desert discovered by Sven Hedin and others, but he spent little time in searching for them; for his aim was not that of an explorer, but that of a student of the natural features of the land. With this end in view he traced the courses, both old and new, of many of the rivers which are finally lost in the sands of the desert. His collection of facts illustrative of geologic history, particularly "the climate of antiquity," both here and in other parts of Central Asia, leads him to the conclusion that the desolation of the region, formerly thickly populated and highly cultivated, is due wholly to climatic changes. The depopulation was caused, not by tribal wars, invasions, deforestation, or excessive cultivation, but by the constantly increasing and irresistible aridity of the land. Such is the salinity of the rivers that he does not believe any artificial irrigation will succeed in restoring the old conditions. The present state may be realized from the fact that during "thirty days of steady travelling we saw absolutely no sign of living man."

Another interesting subject which engages his attention is the effect of physical environment on human character. His intercourse with the natives showed him that the nomadic life entailed by the plateaus and deserts accentuates certain characteristics, such as hardihood, hospitality, laziness, morality, and family affection. The dwellers on the oases, on the other hand, who cultivate the land and lead a comparatively easy life, develop weakness of will, cowardice, immorality, and feebleness of the parental and family ties.

The closing chapter is an attempt to apply his main conclusions to illustrate phases of all history, both ancient and modern, of Asia and of America. The incidents of his journey are narrated simply, and are often entertaining. There are many pleasant pictures of native life, and few that are disagreeable. An unusual experience was when, at a height of 20,500 feet in the Himalayas, he heard the song of a bird, probably a migrant from India to Turkestan. It is certainly a marvellous thing that these little warblers, with the most wavering and uncertain flight, should be able to cross two hundred miles of bleak desert, most of the way at an elevation of nearly four miles above the level of the sea. The attractiveness and value of the work are enhanced by eighty-two reproductions of photographs, several maps, a list of books referred to, and an excellent index.

From Ginn & Co. comes the news that Prof. D. E. Smith, who is travelling about the world in search of material for his history of arithmetic, has acquired valuable information from the Buddhists of Burma and from the Calcutta Museum.

The Academies of Berlin and Copenhagen have completed the catalogue of Greek and Latin medical MSS., and now these two academies, with that of Leipzig, have been authorized by the International Association of Academies to publish the Corpus Medicorum. The Medici Græci alone will occupy thirty-two volumes.

"The Semi-Insane and Semi-Responsible," by Dr. Joseph Grasset, professor in the University of Montpellier, France, has been translated by Dr. Smith Ely Jelliffe, and published by Funk & Wagnalls. The tendency to specialization in the problems of psychopathology which has become so marked in the past few months seems to have gained a strong foothold among French investigators. Following the exhaustive studies of Du Bois, and of Janet, whose recent book on a single disease (hysteria) is enjoying a wide reading, the author of this volume has taken up a timely and highly important subject. By "Semi-Insane" he would have us recognize a group of cases rather sharply blocked off from the absolutely sane on the one hand, and the hopelessly insane on the other. His definition would include therefore, those several conditions which in Kraepelin's classification are spoken of as the psychogenic neuroses, constitutional psychopathic states, and the various psychopathic personalities. As for the "Semi-Responsible," Grasset means those individuals who possess an "attenuated" or limited responsibility, inasmuch as their "psychic neurons" are imperfect. He draws a strong distinction between *responsibility* (the expert's descriptive term) and *culpability* (which belongs exclusively to the judiciary) in all medico-legal proceedings. He declares that the semi-insane may be intellectually superior but morally deficient and offers good and fair proof for this statement. Moreover, the semi-insane are often harmful to society, whose duty and right it is to protect itself against their misdeeds while helping and treating them at the same time. Punishment and careful treatment, therefore, should go hand in hand in order that these individuals be not lost to the community in an intellectual and economic sense. The volume is well written and is destined to become the expert's *vade mecum* in future medico-legal discussions.

Drama.

Der Dummkopf: Lustspiel in fünf Auzügen. Von Ludwig Fulda. New York: G. E. Stechert & Co.

It is interesting to note that the first work coming from the pen of Ludwig Fulda since he wrote "Amerikanische Eindrücke," describing his tour of American universities (reviewed in the *Nation* of May 30, 1907, p. 500), is a comedy of the kind in which Fulda usually excels, showing again the genial influence of his contact with Western civilization. In his "Impressions of America," Fulda draws pointed comparisons between social and educational conditions in the Old and the New World, and especially between the social position and the objects in life of young American men and women and those of his Fatherland. In "Der Dummkopf" there is a merciless characterization of that class of social and financial dependents in Germany known as the blooded, but penniless, student, the floating adventurer looking for both *Beruf* and pocketbook; and there is also a rather pleasing sketch of the clever young American—in this case a woman—who thinks clearly, knows what she wishes to do, and in due time goes straight to her goal. She speaks German fluently; and this enables the author to dispense almost wholly with English, using now and then the easily-understood "All-right," of which Germans seem so fond.

"Der Dummkopf," or Blockhead, is a young man, Justus by name, by no means so verdant as at first appears, but inclined to believe every one honest who makes profession of friendship. He alone of many kin has not bowed the knee to Baal in the home of a rich uncle, but has asked him only once for money, and then in behalf of others. The result is that the uncle, in his last will and testament, leaves him the bulk of his fortune, explaining that Justus is the most stupid of all his relatives, in not looking out for himself. Justus resents what he regards as a shameful trick, and refuses the bequest, signing away all claims in favor of several cousins. The American girl or girls, for Doris, the daughter of a multi-millionaire, has a companion with her, appear conspicuously when, having refused the proposals of the fortune-seeking cousins, they learn that these same spendthrifts, who owe all they have to Justus, have turned their backs upon him and actually plan his ruin. Doris's interest leads to a friendly concern for his welfare; successive interviews reveal to her the dreams of the too-confiding young man; and on the eve of her departure for America, she discovers a plot to incarcerate him as a lunatic, and cancels her sailing in order to help him. She intercedes with the physician, learns to her joy that the specialist thinks he is not only sane, but exceptionally gifted; incidentally discovers, through the doctor, who has read his diary, Justus's love for her as a divinity beyond his reach; and finally rescues him altogether by agreeing to marry him and take him to America with her.

The *motifs*, it will be seen, are familiar; and the philosophy is not profound. Doris and her companion Lucy recall Minna von Barnhelm and Franziska, as two women travelling together and besieged because of the reputed wealth of the one. There is a likeness, too, in the use of the trick—the report that the lady is, after all, poor—to ward off unwelcome suitors. Nevertheless, with all that is derivative, Fulda proves himself entertaining. The characters are well drawn, and the situations—such as the opening of the will, the signing away of Justus's rights, and the discomfiture of the scampish cousins—all are capable of strong stage effects.

The third edition of A. E. Haigh's "Attic Theatre" (Henry Frowde) supersedes completely the former two, by reason of the thorough revision and rewriting which the late author had begun, and which A. W. Pickard-Cambridge has finished in accordance with Mr. Haigh's general intentions. All important works and articles bearing on the subject which have recently appeared have been considered, and the results incorporated in the text or foot-notes. Among these are especially Puchstein's "Die griechische Bühne," Dr. Adolph Wilhelm's important collection of inscriptions bearing on the Greek drama, and Prof. Edward Capps's article on the same subject. In accordance with the labors of the two latter, the list of Dionysiac inscriptions has been enlarged, a new appendix discusses the original place of the Lenæa, and a new section states Puchstein's theory of the stage-buildings of the Dionysiac theatre. Dörpfeld's volume and his more recent articles are summarized and controverted at considerable length; while due reference is made to the ideas of Wiesder, Bethe, Roberts, and many others. The book is therefore a fair and useful compendium of the most recent information. Mr. Haigh still clung to his notion of a low stage in the fifth century, for reasons which are chiefly optical and imaginary. Admitting the necessity of free movement at that date between actors and chorus, he says "the main reason for the employment of a stage must have been to make the actors clearly visible to the audience," and to prevent the view of them from being obscured by the chorus. The Harvard performance of the Agamemnon in 1906 would seem to have settled that question: *Solvitur spectando.*

There seems to be a possibility that the Russian Theatre may become a permanent institution here, like the French, German, and Italian. Early in March Madame Komissargovsky, Countess Muravieff, is to give a series of representations in the Liberty Theatre. This lady, described as leading actress of the Imperial Theatre at St. Petersburg, is to bring her own company of thirty. The repertory includes plays by Ibsen, Hauptman, Maeterlinck, Tolstoy, Tourgenieff, Gorky, and others.

Otis Skinner will bring his new play, "The Honor of the Family," to the Hudson Theatre, in a few weeks. It is founded upon one of Balzac's stories, and is said to furnish him with an effective part. Mr. Skinner is one of the few capable actors of romantic parts yet left to us. He knows something about the laws of both utterance and gesture.

Viola Allen will begin an engagement in the Astor Theatre on January 20, appearing in Anthony P. Wharton's play, "Irene Wycherley," in which Lena Ashwell has been very successful in London.

Music.

The Letters of Robert Schumann. Selected and Edited by Karl Storck. New York: E. P. Dutton & Co. $3 net.

Of all the great composers, Schumann and Wagner were the most interesting letter writers. In the case of Wagner, the story of his life and works could be told almost completely from the data contained in his correspondence. The same may be said about Schumann, at least so far as his life is concerned. His letters are not nearly so numerous as Wagner's, and almost all of them are worth reading; nevertheless, for these busy days there are more than the average music lover has time to read. It was therefore a happy thought on the part of Dr. Storck to make a selection of 133 of the best, and to group them in sections illustrating the main divisions of Schumann's career. It cannot be said that the editor's Introduction, which is chiefly concerned with Jean Paul and German romanticism, is particularly illuminating. The translator, Hannah Bryant, probably felt this, and so she wisely added a five-page "Biographic Note," which is more useful. She has done her work well, and has contributed some of the foot-notes, too.

Some of the most interesting of the letters here presented are taken from the two volumes so far issued of Litzmann's "Clara Schumann," which are made up largely of the substance of the diary which Schumann and his wife kept, and which in manuscript fills forty-seven quarto volumes. Dr. Storck heads this section of his book "The Fight for Clara." Even the fragmentary glimpses of the struggle here presented will convince the reader that actuality gives us one of the most thrilling love stories on record, and make him eager to peruse the details in Litzmann's volumes. The characters are: One of the greatest of composers; Clara Wieck, who loved Schumann as ardently as he loved her—"the most glorious of girls, the greatest of artists," as she appeared to him; and Clara's father, who acted with almost incredible meanness and cruelty toward the lovers, compelling them ultimately to resort to the courts for permission to marry without the paternal consent. The father's attitude finds its explanation in the fact that Clara was dearer to him as an artist than as a daughter. He had trained her from her childhood, and she had become one of the most famous pianists of the day. Was he to submit quietly to the merging of the pianist into the wife of a composer in by no means affluent circumstances?

The letters of this group, which are "one of the prose poems of German literature," and which show incidentally how largely Clara influenced Schumann's creative impulses, will interest the general reader as much as the music-lover; so will those of the first group, written during Schumann's university study at Heidelberg and Leipzig and his travels in Switzerland and Italy. These are judiciously selected from the "Jugendbriefe" and the "Neue Folge," edited by F. G. Jansen. One misses many of the gems in these collections; but Dr. Storck has wisely limited his number. The best of the "Jugendbriefe" are addressed to Schumann's mother. In one of them, speaking of her letters, he says: "Every word is a flower." That is certainly the case in some of his letters to her. When he wrote them he did not dream they would ever get into print, yet their literary quality is of the highest. Nothing could be better than p. 28, on which he describes the hubbub on the deck of a Rhine steamer. From Brescia he writes (p. 37) to his sister-in-law a prose poem about the deep blue skies, the luxuriant grass, the groves of apricot and lemon trees, the soft southern air astir with butterflies, the fine flashing eyes of the Italian women, "much like yours when you are enthusiastic about anything"; the distant Austrian Alps, sinewy and jagged, "as they glow red under the sun's parting kiss, and then become cold, monstrous, and lifeless."

In his travel sketches, Schumann surpassed even Mendelssohn—as he does in his music. Yet Mendelssohn was always one of his idols; as late as 1839 he writes: "I doff my hat to him as my superior." His favorite, however, as we discover in several of the letters of the later period, was Schubert. We would emphasize particularly, for the benefit of music-lovers of to-day, the following sentence from a letter to Simonin de Sire: "You are, of course, acquainted with Schubert's songs; but I place at least as high his compositions for pianoforte, especially those for four hands." Nobody ever plays these in public. In the letters of the last period, when his mental breakdown was imminent, his new friends, Joachim and Brahms, play a prominent rôle. Dr. Storck cites, among other things, the diary of a musician dated February 21, 1854, which gives pathetic glimpses of the tragedy in which the love story of Robert and Clara ends:

> Schumann has been out of his mind for some days. . . . Frau Schumann looks worse than I have seen her. . . . Poor, unhappy lady! She sits by the bedside all night, listening for the least movement.

Among the recent publications of the Brahms Society in Berlin, which will interest music-lovers in general, is an arrangement by Brahms of Schubert's "Ellen's Zweiter Gesang" for soprano solo, women's chorus, and wind instruments.

Richard Strauss always gives descriptive titles to his tone-poems, and then tries to mystify the public by withholding the clues to the details. To friends, however, he gives clue after clue, until finally the story is complete. Ernest Newman, though a champion of this composer, cannot refrain from remarking:

> With each new work of Strauss there is the same tomfoolery—one can use no milder word to describe proceedings that no doubt have a rude kind of German humor, but that strike other people as more than a trifle silly.

The imitators of Strauss, whose number is steadily growing, follow him in this "humorous" method, too. The latest of them is Hermann Bischoff of Munich, whose symphony in E major, opus 16, was played in Carnegie Hall last week by the Boston Symphony Orchestra. When this work was produced at Essen the composer wrote that his piece had "nothing to do with programme music," but, nevertheless, in order not to be out of fashion, he insisted that it "presents throughout programme music" whereupon he proceeded to amuse himself by sketching a mawkish story. This may be a joke, but the symphony itself is no joke. It lasts five quarter-hours, and every one of them is a *mauvais quart d'heure*. The man has absolutely nothing new to say, and the way he concatenates his noisy nothings is appalling. Dr. Muck and Mme. Teresa Carreño atoned for this up-to-date Teutonic rodomontade by a capital performance of MacDowell's second concerto for pianoforte. Two days later the same composer's Forest Suite was played under the direction of Dr. Muck. Altogether, the greatest of American composers seems to be coming into his own.

Readers of the Vienna *Zeit* got as a Christmas gift an interesting contribution to the story of Beethoven's life in the form of a memorandum drawn up by the composer in February, 1820, as a basis for an application that the Court of Appeals should reappoint him guardian of his nephew instead of his sister-in-law, Frau Johanna Beethoven. It is written throughout in Beethoven's hand, and throws considerable light upon his mental constitution. It shows him to have been high-minded and true-hearted, honestly anxious that his brother's son should be rightly educated and well trained, but hampered by a pedantic irascibility and a sense of his own goodness that must have been intensely irritating to those with whom he had to deal, and must have facilitated the constant intrigues of the mother to retain control of her son. The portrait which Beethoven draws of his sister-in-law is that of a slanderous, treacherous, malicious, libidinous shrew. He defends himself against the suspicion of rancor towards her, and says:

> Let no one believe that I am, as she says, moved by a spirit of revenge or private hatred against her. It is painful for me to have to speak of her, and, were it not for my nephew, I would neither think of her nor talk of her nor act against her.

The memorandum gives an exact account of the moneys spent upon the education of the nephew, for whom Beethoven provided entirely, and in whose favor he also deposited 4,000 florins in the national bank. The composer must have spent fully $500 a year on the nephew out of his slender resources.

Art.

Die Entwicklung der alt-chinesischen Ornamentik. By Werner von Hoerschelmann. Beiträge zur Kultur und Universalgeschichte, herausgegeben von Karl Lamprecht, Heft IV. Leipzig: R. Voigtländer's Verlag.

The development of ornamental art in ancient China is as much a branch of the history of that Oriental empire as the accounts of emperors, dynasties, political changes and battles. This new contribution toward an interesting problem of Chinese life is apparently due to the inspiration given to young workers by the German historian, Dr. Karl Lamprecht. Herr von Hoerschelmann's pamphlet is a fine illustration of Lamprecht's principles. By careful analysis the author traces the development of the earlier ornamental art of the Chinese as preserved in the sacrificial bronze vessels of the Shang and Chóu dynasties (some of the best specimens of which are in the hands of American collectors, H. O. Havemeyer's ranking foremost), and in the metallic mirrors of the Han dynasty. These bronze works, the only legacy from the most ancient Chinese art, have been described and depicted in Chinese illustrated works, the study of which has within recent years attracted the attention of art investigators.

It is a remarkable fact that the conclusions arrived at were based on the mere analysis of ornaments from the outset, and that the author was in no way biassed by the opinion of native critics. Being an absolute stranger to the Chinese language, he began by trying to classify the drawings before him, thirty-seven characteristic specimens of which form an instructive appendix of plates; and the first result was his conviction that, far from being a medley of fanciful oddities, these ornaments betray a logical sequence of development. His classification being completed from the purely artistic point of view, the author consulted a sinologue, through whom he learned that differences in style can be clearly traced for the various periods to which Chinese archæologists assign the several works. Thus the ornament of the Shang dynasty (1766 to 1122 B. C.) is quite distinct from that of the succeeding Chóu (1122 to 249 B. C.). Native critics rely not merely on this difference in style, but also on the testimony of the hieroglyphic inscriptions found on the greater part of the old sacrificial vessels.

This study of Chinese art has greatly strengthened our confidence in Chinese tradition. Some Western writers date the historical period from an eclipse of the sun, specified by date in the Chinese "Book of Odes," in the year corresponding to our 776 B. C. The latest writer on Chinese history (H. J. Allen, "Early Chinese History: Are the Chinese Classics Forged?" London; 1907) even looks upon Confucius, and with him, of course, upon all we know of the Chinese before him, as mythical. The analysis of Chinese works of art is the best argument against such absurdities. We must admit the doubtfulness as historical figures of the model emperors Yau, Shun, and Yü, to say nothing of Fu-hi and Huang-ti, but the bronzes of the Shang dynasty may be looked upon as living witnesses of national culture existing in the second millennium B. C. It is easy to say, with skeptics like Mr. Allen, "These bronze works are all forged just like the books ascribed to Confucius and his school"; but how do our skeptics explain the progress in the development of ornaments clearly traceable in the products of succeeding generations?

Chinese art, as far as known to us, was up to a certain time autochthonous. Foreign influences began to act on it as the result of political relations with Bactria and other Western Asiatic countries. Hellenistic influences have been traced in certain classes of metallic mirrors, and it is highly probable that the caravan expeditions of the Emperor Wu-ti in the first century B. C., which Chinese historians tell us returned with treasures of Western art and industry for the Imperial museums, are in the first instance responsible for the many changes in the style of ornaments after the fall of the Chóu dynasty. It cannot be denied, however, that influences from quarters nearer by have also had their share. We should not forget that the bronze vessels now representing the most ancient Chinese art owe their preservation to the accident of having been the instruments of ancestral worship as long as Confucianism flourished. We cannot imagine that in times of persecution, as in the days of Shï-huang-ti, when the anti-Confucianist "First Emperor" consigned tripods and bells to temporary oblivion, there was neither art nor ornament, even supposing the technique of bronze casting had been lost. From the analogy of the development of Chinese culture generally we may assume that in those days Chinese and Tartar elements of style began to appear in the bronzes; and some generations later the Hellenistic ornament was grafted on, resulting in ornamental patterns widely differing from those of the Chóu dynasty.

The Macmillan Company announces the first volume of "A Catalogue Raisonné of the Works of the Most Eminent Dutch Painters of the Seventeenth Century," based on the work of John Smith, by Dr. C. Hofstede de Groot, and translated by E. G. Hawke.

Late this month the Stokes Company will publish four new volumes in their Masterpieces in Color, viz.: "Raphael," by Paul

G. Konody; "Lord Leighton," by A. L. Baldry; "Rembrandt," by Josef Israels; and "Fra Angelico," by James Mason.

The second number of the new periodical, *Ausonia*, the organ of the Società Italiana d' Archeologia e storia dell' Arte, contains a number of interesting articles which speak well for the future of this paper. In one Dr. Alessandro Della Seta publishes the Niobid, which was found in Rome in the region of the gardens of Sallust, and which is now set up in the Banca commerciale Italiana. Like Professor Furtwängler, the writer brings the statue into close relation with the two figures of Niobids in the Ny-Carlsherg Glyptothek, in Copenhagen, and thinks that all three once decorated a tympanon. To enforce this theory he quotes a passage from Pirro Ligorio in which is mentioned near the gardens of Sallust the ruins of a temple of Diana, and scattered statues of Niobids. Luigi Savignoni, in another article, discusses the colossal statute of Apollo Pytios, which was found in Crete in the city of Gortyna. By comparing it with other statues of Apollo, in the different European museums, he comes to the conclusion that the statue is a replica of a work of Praxiteles, and reproduces the same type as the statue of Apollo, which Augustus set up in the temple of the Palatine, and which is mentioned in the writings of Propertius. Of special interest is G. Zippel's study of the history of the Palazzo di Venezia, in Rome. In his opinion, the plan of the palace and the architectural decorations are closely analogous to buildings in the south of France, and he mentions especially the palace of Sorgue, which Pope John XXII. built in 1320.

The excavations at Ostia, the ancient harbor of Rome, have lately yielded some interesting finds. A room has been unearthed which is still in a wonderfully good state of preservation, with a pavement in black and white mosaic and walls decorated with figures and architectonic designs. Upon the floor were discovered fragments of the ceiling, painted to match the walls; these can probably be put together again and restored to their original position. Among the rubbish which filled the room were a great quantity of Roman coins, several amphoræ with painted inscriptions (among them one that contained olives), pieces of glass with gold letters, several lamps, and remains of inlaid furniture. The wall-paintings in this room are better preserved than any others found in Ostia, owing to the fact that at some later period they had been covered with a coat of white plaster. The room also contained a window, evidently glazed with mica, the ancient substitute for glass, since many pieces were found immediately beneath it. The excavations are being continued with much energy, under the superintendence of Prof. Dante Vaglieri, who is in charge of the excavations in the province of Rome, and it is hoped that they will meet with further success.

In digging the foundation of the new Italian House of Parliament in the Piazza di Monte Citorio, close to the Piazza Colonna, where the column of Marcus Aurelius stands, a tomb has been unearthed which is believed to contain the remains of the Emperor Antoninus Pius and his son-in-law and successor, Marcus Aurelius. It is thought that further excavations will bring to light fragments of the original inscription, and thus elucidate the history of the monument.

According to the London *Times*, a special commission has just been appointed to direct and supervise the excavations at Herculaneum. This commission is composed of Commendatore Giovanni Gattini, administrative director of the Museum of Naples; Giulio de Petra, professor of archæology, University of Naples; Prof. Ettore Gahrici and Prof. Innocenzo Dall' Osso, both of the Museum of Naples; Prof. Antonio Sogliano. director of the excavations at Pompeii; Commendatore Avena, director of the technical office of the monuments of Naples, and, finally, two civil engineers of the province of Naples. The work that is accomplished, the finds and discoveries, and anything of interest will be described from time to time in official publications, for the benefit of home and foreign students and scholars.

Among the exhibitions in the dealers' galleries in this city are paintings by Eugene Paul Ullman and statuettes and medallions by Dr. R. Tait McKenzie, at Fishel, Adler & Schwartz's, till January 18; paintings by Max Weyl, Bauer-Folsom's, January 25; engravings by early Italian masters, Frederick Keppel & Co.'s, February 1; and views in Holland, by Charles P. Gruppé, February 8.

An exhibition of the works of Remhrandt will be opened in May at the Bibliothèque Nationale.

Charles Hermann-Léon, the artist, has just died in his seventieth year. He was a pupil of Ph. Rousseau and of Fromentin, a member of the Société des Artistes Français, and a constant exhibitor at the Salon, where he obtained medals in 1873, 1879, and 1900.

Finance.

END OF THE MONEY HOARDING.

On October 26, in the week of the run on trust companies and the outbreak of panic, the New York bank statement reported a deficit under the 25 per cent. ratio of reserves to deposits required by law. That deficit grew, by November 23, to the portentous figure of $54,103,000, by far the largest shortage in the history of American banking. At the climax of the panic of 1893, the greatest deficit was $16,645,000; and while the banks published no statements during the worst days of 1873, it is impossible that either of the above-named figures should then have been matched. Since the opening of December, cash holdings of the New York banks have been gradually increasing, and the deficit simultaneously diminishing; last week, a remarkably large increase of $18,300,000 in cash wiped out the deficit, and replaced it with a surplus of $6,000,000. This unusually large gain in cash was caused in part by return of currency from the interior, but chiefly by return of currency hoarded in and around New York. For the sudden and large deposits on both accounts, the plain explanation is, that the New York banks had resumed full cash payments to depositors a week before. This action was indispensable to allay distrust. Had the banks abandoned the "restriction policy" a month ago, they would probably have reported a surplus long before January 11.

Meantime, the problem as to where all this missing cash was held has not been cleared up. In one way or another, after allowing for all the shipments of currency from New York to the interior, not less than $90,000,000 in actual money disappeared, between October 21 and November 23, from the usual repositories. Until last week, the prevalent explanation (as to which the facts were still in doubt) was that the trust companies had gathered large sums of cash to provide against further runs. The December reports of the trust companies to the Banking Department, compiled and published a week ago, show that nothing of the sort occurred. Enormous amounts of currency—certainly more than $50,000,000—did indeed pass into the New York trust companies from other quarters in the panic week, and were then paid out to frightened depositors and to messengers of other banks. But that the trust companies have been "hoarding," is not true. The forty-eight trust companies of Greater New York which passed through the panic without closing their doors, held on December 19 $7,278,500 less cash than on August 22. That is to say, the reports of the trust companies, instead of partly accounting for the $90,000,000 cash which was swallowed up somewhere in New York this autumn. force the investigator to enlarge his estimate of the missing money. Moreover, the figure of $97,000,000, to which the disappeared currency has now risen, ought actually to be increased by the extent to which national banknotes. issued since October. were used as reserves by State banks and trust companies. They have a right to count such currency as reserve, and we may be very sure that some of it was used for the purpose.

Some of the missing cash was doubtless held by savings banks which feared the possibility of another run of depositors when the "sixty-day notice" expired on December 27, and which mistrusted the willingness of deposit banks to give up cash if savings institutions entrusted it to them. The balance must have been somehow kept in hand by a great mass of private individuals.

Under the editorial direction of Prof. J. H. Hollander the Johns Hopkins Press will issue reprints of four important economic essays of the eighteenth century: "The Querist, containing several queries, proposed to the consideration of the public," parts i., ii., iii. (by George Berkeley), Dublin, 1735-37; "An Essay on the Governing Causes of the National Rate of Interest; wherein the sentiments of Sir William Petty and Mr. Locke, on that head, are considered" (by Joseph Massie), London, 1750; "Money Answers All Things: or, an essay to make money sufficiently plentiful amongst all ranks of people, and increase our foreign and domestick trade" (by Jacob Vanderlint), London, 1734; "An Essay on Ways and Means for Raising Money for the Support of the Present War, Without Increasing the Public Debts" (by Francis Fauquier), London, 1756. Each tract will be provided by the editor with a brief introduction and with text annotations.

BOOKS OF THE WEEK.

Abbott, Leonard D. Ernest Howard Crosby: A Valuation and Tribute. Westwood, Mass.: Ariel Press. 50 cents.

Anson, Sir William R. The Law and Custom of the Constitution. Vol. II. Frowde. $3.40.

Baldwin, Ernest H. Stories of Old New Haven. Taunton, Mass.: C. A. Hack & Son.

Barbier, Auguste. Iambes et Poèmes. Frowde.

Bazin, René. Contes Choisis. Edited by Victor E. François. Boston: Heath: 35 cents.

Bellot, Lieut. René. Voyage aux Mers Polaires. Frowde.

Bibliographical Notices. Six books printed in Iceland, 1578-1844. Ithaca.

THE AMERICAN NATURE SERIES

The first book in the large popular natural history is

Fishes

By DAVID STARR JORDAN, President of the Leland Stanford University; 789 pp., 671 illustrations and 18 colored plates. 8vo, $6.00 net. Carriage additional.

This volume contains virtually all the non-technical material contained in the author's standard two-volume work, "Guide to the Study of Fishes."

NEARLY READY

American Insects

By VERNON L. KELLOGG, Professor in the Leland Stanford Junior University.

North American Trees

By N. L. BRITTON, Director of the New York Botanical Garden.

ARRANGED FOR

Seedless Plants

By GEO. T. MOORE, Head of Department of Botany, Marine Biological Laboratory, assisted by other specialists.

Birds of the World

By FRANK H. KNOWLTON, President Biological Society of Washington, etc., etc., with chapter on Anatomy of Birds by FREDERICK A. LUCAS, Chief Curator of the Brooklyn Academy of Arts and Sciences. Edited by ROBERT RIDGWAY, Curator of Birds, U. S. National Museum.

American Wild Mammals

By C. HART MERRIAM. Chief of the United States Biological Survey.

Reptiles and Batrachians of the World

By LEONHARD STEJNEGER of U. S. National Museum.

HENRY HOLT & CO 29 W. 23d St. NEW YORK

Studies in History, Economics & Public Law

Edited by the Faculty of Political Science of

Columbia University

NEW ISSUES

Volume XXVIII. Nos. 2 and 3.

The Legislature of the Province of Virginia

Its Internal Development. By ELMER I. MILLER, Ph.D., Professor of History and Political Science, State Normal School, Chico, Cal. *Paper, 8vo, $1.50 net*

The Distribution of Ownership

By JOSEPH HARDING UNDERWOOD, Ph.D., Professor of History and Economics, University of Montana. *Paper, 8vo, $1.50 net*

Volume XXVIII., in cloth.
564 pages, $3.50 net

A NEW EDITION

Completely revised and enlarged, of Volume IV., No. 2.

The Inheritance Tax

By MAX WEST, Ph.D., Sometime Fellow and Lecturer in Columbia University, Special Examiner in the Bureau of Corporations.
Paper, 8vo, $2.00 net
Cloth, 8vo, $2.50 net

The World's Peoples

By Dr. A. H. KEANE, author of "Anthropology," "Man Past and Present," etc.

270 Illustrations, $2.00 net.

A popular, accurate and concise work, very fully illustrated, comprising a clearly written description of the races of the world by one of the greatest living anthropologists,

G.P.Putnam's Sons 27 W. 23d St. New York

WHAT WE ARE DOING FOR LIBRARIANS

We now have the most efficient department for the handling of Library orders.

1. A tremendous miscellaneous stock.
2. Greatly increased facilities for the importation of English publications.
3. Competent bookmen to price lists and collect books.

All of this means prompt and complete shipments and right prices.

THE BAKER & TAYLOR CO.
WHOLESALE BOOKSELLERS
33-37 East Seventeenth St., New York

The Nation.

NEW YORK, THURSDAY, JANUARY 23, 1908.

The Week.

Gov. Hughes's letter explicitly stating that he will stand for the Presidency if the Republican nomination comes to him unsought, puts the case with simple dignity. It is not for him or any man to refuse the great office and the great responsibility. But his terms must be clearly understood. He is not going personally to engage in a fight for delegates. Whatever may be the fact with another Administration, *his* Administration is to be kept out of politics. Neither by the use of patronage nor by any direct appeal whatever, will Gov. Hughes seek the support of any man at the Chicago Convention. All that he desires is the free expression of the party's choice. If it falls upon him, he will do his best to serve the country; if it prefers another, he will be perfectly content, and will go back to the practice of his profession. The immediate effect of the announcement must be to strengthen the movement for Mr. Hughes; for there is a growing feeling that the peculiar need of the hour is a man who is known for intellectual vigor and moral steadiness; who is progressive, yet sure-footed; who makes the impression on all beholders of courage, independence, and a love of justice.

Ex-Senator Chandler is the latest practitioner of the spoils system to be moved to holy horror by the President's excesses in the use of patronage. He joins Foraker and Gallinger in rebuking Mr. Roosevelt for recreancy to that civil-service reform which they all love. In a letter which Chandler, together with ex-Gov. Kellogg of Louisiana, issued Tuesday morning to Southern Republicans, he calls upon them to resist the President's blandishments and terrors alike, and to send uninstructed delegations to Chicago. Chandler's pen has not lost its cunning, as may be judged by this adroit passage from his letter:

> President Roosevelt's first appearance in public office in Washington was as a civil service commissioner; he abhors the use of patronage to control political conventions and has forbidden Federal officials to use their time and influence for political purposes. Any Federal officeholder seeking to control delegates to the Presidential convention is disobeying his orders and should be thrust aside by every self-respecting Republican at the South.

And it must be said that President Roosevelt is exposed to a peculiar humiliation when he lays himself open to attack by men of the Chandler and Gallinger class. There is every sign at present of a powerful combination in the Senate to uncover and thwart Mr. Roosevelt's use of the Federal patronage to promote the nomination of Taft. On Monday, the Senate rejected the nomination of a pension agent in New Hampshire, avowedly made to further Taft's fortunes in that State. Both the New Hampshire Senators objected to confirmation. Coming on top of the rejection of the Ohio postmasters—a matter which we discuss elsewhere—and taken with the reported intention of the Senate to inquire into the Wanmaker appointment in this city, and into the whole charge that the Federal machine is being worked to its full power to force the nomination of Taft, the incident promises to do something for civil-service reform, even if at the expense of one of our most ardent civil-service reformers.

If a two-cent-per-mile passenger fare is confiscatory in Pennsylvania, as the Supreme Court of that State has just decided, it is fair to ask how many of last year's two-cent-fare statutes could stand the test of litigation. Just how traffic conditions in Pennsylvania compare with those in other States, is a question for experts. The mountainous character of the State doubtless offsets to some degree the economic advantage of exceptionally heavy traffic. Still, Pennsylvania has something like 145 inhabitants to the square mile, as against less than 25 in Minnesota, where a two-cent-fare law, passed with equal alacrity, has likewise been taken to the courts. It seems to us altogether probable that the outcome of all this litigation will be a striking vindication of the wisdom of entrusting the determination of such questions to a special body. It is a notable illustration of slap-dash legislative methods that the only State commission which did undertake an exhaustive inquiry into the general fairness of passenger rates, that of Wisconsin, was overruled by the Legislature, which passed a two-cent law on top of the commission's order fixing 2½ cents a mile as a reasonable rate. It does not appear, however, that the States which took such action on general principles are going to be any the better for it in the long run. Our up-State Public Service Commission has been criticised for failure to reduce passenger fares promptly. We trust that, when it does act, it will be so fortified with facts that its decision will stand judicial scrutiny.

Gov. Guild of Massachusetts argues stoutly for tariff revision, but declares with his next breath that he is not a candidate for any further public office. Is this an acknowledgment that a loyal Republican and sincere protectionist takes his political life in his hands when he asks the friends of the tariff to perform that task for which they alone claim to be qualified—bringing its schedules up to date? That remains to be seen. Still, if tariff reform must have its martyrs, Massachusetts is fitted to produce them. If there are degrees of iniquity in a system to which the objection is always fundamentally on moral grounds, the Dingley tariff is superlatively unjust to Massachusetts. The late Edward Atkinson analyzed, some four years ago, the tariff schedules in the light of the census of occupations, and concluded that, taking the country as a whole, out of 29,074,117 persons in gainful occupations, only 600,000 were occupied in "arts which would require a readjustment if all duties were suddenly removed, which no one proposes," while 2,396,285 more "would be practically free from foreign competition, if materials of foreign origin used in their processes were free of duty." The first class alone included about one wage-earner in 48, both combined about one in 9—a small enough proportion at best to justify a tax on the whole country. But for the city of Boston, the corresponding ratios were found to be 1 in 125 and 1 in 20, respectively. In a community where the possible tariff beneficiaries are only about one-fifth as numerous as in the country at large, it does seem as if Gov. Guild should be comparatively safe, even though his speech before the Shoe Manufacturers' Association was, according to stand-pat theory, incendiary.

The sub-committee of the currency commission of the American Bankers' Association has issued a statement which effectually disposes of two currency reform measures now before Congress—the Aldrich bill and the Fowler bill. The Aldrich bill, authorizing a taxed emergency bank circulation based on State, city, and railway bonds, such as savings banks may invest in, is condemned from almost every point of view. The measure would, in the committee's opinion, be an entering wedge for removal of real security against such circulation; it would not meet the emergency of a panic because of inevitable delay in putting out the notes; it would force the issuing bank to invest $100,000 in such Stock Exchange securities for every $75,000 of new note circulation taken out, and would thereby reduce the lending power of the bank; and, finally, it would tend to create a fictitious market for such securities and thereby encourage extravagance in their issue. The committee might have added, what already seems the politically fatal objection to the plan, that it discriminates against interior banks, which are not in ready touch with the market for such securities. As to the radical and highly complicated Fowler bill, which would revolutionize at one stroke the entire currency system of the country, the committee expresses belief that its passage "would unsettle rather than improve financial conditions." The committee revives, as an alternative proposition, the scheme approved by the Bankers' Convention last September for a taxed circulation equal to 40 per cent. of outstanding bond-secured circulation, and an additional amount equal to 12½ per cent. of capital, both issues taxed and both protected by the same cash reserve as is carried against deposits. In principle, this plan commends itself. Our objection runs chiefly against the low rate at which this additional currency is taxed—2½ per cent. per annum on the first of the above classes, and 5 per cent. on the second. We believe that the tax should be high enough to force the retirement of such notes the moment that urgent need for them has ceased, and in order to compass that end, the issuing bank ought to pay something like the rate which would prevail for money at such times. But since neither 2½ nor even 5 per cent. is a fair price for money in the pinch of acute stringency, such additional circulation might conceivably be issued and kept outstanding, when there was no legitimate call for it. What, for example, would have been the policy of banks, during the artificial stringency created by our "millionaire booms" on the Stock Exchange, in 1905 and 1906? A currency measure which, even indirectly, would give aid to such undertakings—especially when the capitalists behind the speculation are in control of powerful banks—ought to be guarded with the most jealous care.

Congress will often wrangle for days over trifles, and then turn aside to enact an important piece of legislation in ten minutes. An example of the latter is furnished by the bill to limit the right of appeal to the Supreme Court in habeas corpus cases, which the House recently passed on the briefest statement by Mr. Littlefield, and almost without debate. The aim was to check that abuse of repeated appeals in criminal cases, of which we have lately had several notorious instances. If counsel suggest an unimportant or even frivolous "Federal question" in a murder trial, and then get their petition denied, they can lay the basis for renewed appeals to the Supreme Court, of which the end, or at any rate the sole result, is delay. According to the bill now sent to the Senate, appeal from the final decision of a United States court, in a proceeding in habeas corpus, shall be allowed to the Supreme Court only when the court appealed from, or a justice of the Supreme Court, shall be of opinion that there is "probable cause." This would put an end to the misuse of the process, and it is to be hoped that the Senate will agree to this bit of needed law reform.

The death of Edmund Clarence Stedman, removes a unique figure from American commerce and letters. He was a successful business man. He has said: "At thirty I went into the Stock Exchange because I needed to be independent in order to write and study." But he steadily resisted the encroachments and absorptions of Wall Street, and devoted a large part of his time to books. That a stock-broker should compile anthologies, produce volumes of criticism, lecture on literature at Johns Hopkins and elsewhere, edit poets, and even write poetry himself, is surprising; that he should do all this so gracefully seems little less than miraculous. But this city has always been a step-mother to letters, and it seems appropriate that one who represented so fully New York's second generation of literary men should have divided his energy between banking and writing. Among the third generation he will be remembered by many who as young men went to him for advice and encouragement, and found what they sought. He had the satisfaction of knowing that he helped to spread a taste for good reading among his countrymen; but for him personally perhaps the best return for his labors was the pleasure and profit that accrue from a wide intellectual interest. In his genial old age he was a fine specimen of sustained mental alertness and serviceable friendship. With great simplicity, yet with honest pride, he cherished a literary tradition of which few exemplars remain.

On Monday, the museum of the Hispanic Society in this city was thrown open to the public and put at the disposition of students. History and literature are represented by some 50,000 volumes in various tongues; arts and crafts by objects for the most part Spanish in origin, which already give a general view of the attainments of the Spaniards in art, and which in course of time will be augmented by the products of Spanish colonies in different parts of the world. The Hispanic Society, founded by Archer M. Huntington, is limited to one hundred members, each of whom must be a specialist in some line related to the aims of the organization. It is well known that Mr. Huntington has devoted his life to Spanish art, history, and literature. To him is due a magnificent edition of the Cid and many reprints of rare works which are boons to Spanish scholars. That Spaniards attach value to his services may be inferred from the honors they have given him, such as a corresponding membership in each of the three Academies of Language, History, and Fine Arts. Among the members of the Society are Professors C. Carroll Marden of Johns Hopkins, Henry R. Lang of Yale, Hugo A. Rennert of Pennsylvania, and Fonger de Haan of Bryn Mawr. The museum contains the largest and most valuable library of Spanish books in North America. It has in its collections gold coins of the Moorish kings and examples of Hispano-Mauresque lustre-ware which are finer and completer than those in all but a few European museums; they would be an enviable addition to Madrid, and some are lacking to the great collections at the Louvre and the British Museum. These collections will be extended, but already they are comprehensive enough to show what a brave figure the Spaniards cut in the history of the arts. The Hispanic Society is the publisher in Paris of the *Revue Hispanique*, a quarterly necessary to scholars; and here in New York its museum should appeal to a much broader public. Such foundations make for culture; this one also for a closer knitting of the interests between us and the republics to the south.

The Hilprecht case has taken another turn. Professor Hilprecht has asked and received from the trustees of the University of Pennsylvania permission to publish "all the correspondence, documents, and evidence bearing upon this matter, presented before and during the investigation conducted by your committee in the year 1905, together with extracts from Vol. XX. of Series A of the Babylonian Expedition of the University of Pennsylvania, reviews and critiques thereon, and correspondence in your possession and mine, both before and since 1905, bearing upon the controversy." This must be welcomed as a step in the right direction, though we believe that the easier and more direct way would be for Professor Hilprecht to prepare an explicit answer to the specific questions covering the main issues. Such an answer at any time in the last two years would probably have been welcomed by the university authorities; for in his letter to the trustees, Professor Hilprecht says that, as a result of the continued agitation and repeated accusations,

> It is my conviction that the report of your committee as made public in 1905 has not been generally accepted as satisfactory, because your proceedings were conducted in private, and you have not made public the "pleadings" and testimony upon which it rests.

That conviction is certainly well founded. The report of the trustees exonerating Professor Hilprecht has generally been regarded as a mere piece of whitewashing. As Professor Hilprecht admits, such an incident could not do otherwise than work "increasingly serious injury to the reputation of the university." It has been a bitter mortification to the distinguished scholars in the faculty, who are well aware that the world has accepted the action of the trustees as an announcement that wealth and social backing count for more than scholarship and truth.

President Eliot's efforts to bring about an agreement by the New England colleges to reduce the number of intercollegiate athletic contests, particularly in football, are reported to have failed. But to have persuaded four out of ten New England institutions that they might play fewer games without proving altogether false to the academic ideal, is by no means to have failed. Undergraduate opinion at Harvard is not in sympathy with the head of the university. The *Crimson* says:

> If Harvard schedules are cut down, we shall be placed at another disadvantage. Let us use our influence for what seems best, but not perform dangerous experiments upon ourselves.

Had this editor been Sir Henry Campbell-Bannerman or Prince von Bülow, discussing the question of naval disarmament, he could not have been more serious. Athletics is as vital to university life as war to national life; and the college that cuts down its teams is like the nation that stops laying down battleships. Columbia alone was foolish enough to believe that the millennium had come, and to drop football.

The report of the Canadian commissioner appointed to inquire into the causes for the sudden increase of Asiatic immigration, laid before the Canadian Parliament Monday, absolves the Japanese government from responsibility, and places the blame upon the Canadian Pacific Railway and other large employers of labor, at whose direct instigation the Japanese government modified its emigrant regulations. Between 1901 and 1907 about 4,500 Japanese immigrants entered British Columbia, whose Japanese population a year ago was less than 7,500. If that number increased by more than 50 per cent. during the succeeding ten months, it was not because Japan had at last determined to overrun British Columbia, but because, among many similar causes, the Lieutenant-Governor of British Columbia had practically contracted for a supply of mine labor in Japan. Apparently, the seat of the yellow peril is nearer to Ottawa than to Tokio.

The Japanese budget, which was submitted to the two houses at Tokio last week, bears internal evidence of the financial strain under which the government is laboring. Taxes are to be raised on such necessaries as sugar and kerosene, as well as on saké, beer, and alcohol. The item of "finance," which includes the interest on the national debt, is considerably more than half the total estimated expenditures. These Japanese are certainly making sacrifices for the sake of their military and naval prestige. Yet we will ask those of our readers who lie awake nights in fear of the aggressions of the little brown men, to compare the military and naval outlay, made at such cost of privation and burdensome taxation, with the corresponding items for this country. One yen is a minute fraction less than half a dollar, and we compare the figures at the ratio of 2 to 1:

JAPANESE BUDGET.

Army ordinary	$35,104.889
Army extraordinary	18,603,497
Navy ordinary	17.405.368
Navy extraordinary	23.069,062
	$94,182,816

CONGRESSIONAL APPROPRIATIONS, 1907-1908.

Army	$78.535,282
Navy	98.958.007
Military Academy	1.929,703
Fortifications	6,898.011
	$186,321,003

Supine as we Americans doubtless are, criminally neglectful of our duty, indifferent to the yellow peril at our very doors, we are nevertheless spending nearly two dollars on martial preparations where the alert and aggressive Yankees of the Orient spend one.

A well-known German writer declares in the January *Neue Deutsche Rundschau* that protective duties compel German consumers to pay from $100,000,000 to $125,000,000 a year in tribute to the wheat-growers of their country. The increase in cost of meat and other necessaries of life is even greater, and this, too, goes into the pockets of the German producers. Indeed, meat is no longer properly described as a necessity, but as a luxury. Hundreds of thousands of persons have learned to do without it, while the consumption of horse-flesh steadily grows—all of this that the government may bolster up in Prussia a tottering, outworn agricultural system. Meanwhile, the mother of Trusts continues to increase her ill-favored progeny in Germany. New syndicates and combinations to keep up prices are steadily reported in the press, with all the evils of artificial high prices with which we are so painfully familiar in the United States. Is it to be wondered at that there is rioting in Berlin's streets, or that the disfranchised cry for a share in the government? In still other aspects does the protectionist government of Germany resemble ours. It is magnificent in its ability to enlarge national expenditures, but can no more cut down its budget than can our own Republican Congressional majority. Economy is too parochial an issue for a nation which aims at the mastery of the seas and looks beyond them for colonial ventures. Although the collapse of the Russian army and the unrest in that country have forced German military men to admit that they have nothing to fear now from even a joint attack by Russia and France, and although the relations with the latter country grow more and more pacific, despite the Morocco entanglement, no one talks of reducing the peace strength of the German army. Yet, if some of the 600,000 men, now withdrawn, were permitted to return to industrial pursuits, they would in part offset the ever-increasing navy bills. Yet when the whole country is suffering from a trade reaction, and Prussia itself is facing a treasury deficit of $125,000.000, the government of that country, with the sanction of the Imperial authorities, is asking the Prussian Landtag for an extra credit of $100,000,000 for the purpose of forcibly expelling Polish landowners from their estates and paying them for the lands thus wrung from them.

The death of M. Guyot-Dessaigne, the French Minister of Justice, has led to a reorganization of the Cabinet. M. Briand has been transferred from the Ministry of Public Instruction to the vacant post; he has been succeeded by M. Doumergue, who surrendered the portfolio of commerce to M. Cruppi, a vice-president of the Chamber of Deputies and a prominent leader of the Radical Left. M. Briand's appointment as Minister of Justice is not altogether due to the fact that his Christian name is Aristides, as one Paris journal suggests. A more potent reason is the present status of the Separation question. As Minister of Public Instruction, M. Briand was the principal figure in the legislative crisis that followed the coming into force of the Separation Law in December, 1906. Before this he had been head of the committee that steered the bill through the Chamber, and the ablest advocate of that measure. He carried the Supplementary Law of January 2, 1907, made necessary by the almost unanimous refusal of French Catholics to organize into *associations cultuelles* for taking over the management of church property. By this time, however, the question of the devolution of Church property has become fully as important from the judicial point of view as from the legislative. The courts will henceforth have to deal with a vast number of cases involving the fulfilment of gifts and bequests granted for specific religious purposes, which are now incapable of realization. As Minister of Justice and keeper of the seals, M. Briand will therefore be in a position to continue his labors for Separation.

MORE "NAKEDNESS."

In a special message to Congress urging that the census clerks be put under the civil-service rules, the President spoke recently of the "cloaks" which had been devised to cover "the nakedness of the spoils system." But last week's proceedings in the Senate make it look as if Mr. Roosevelt himself were in need of some sort of wrap. He was exposed to a wintry blast from the Ohio Senators, who showed that he had been using the post-offices in their State to aid Taft, and who brought about the unanimous rejection of his nominees. And no Administration Senator came out of the cloak-room to protect the President from the icy cold.

Of course, strictly speaking, there is no violation of the civil-service rules in appointing postmasters who have ratted from Foraker and are devoting themselves to running conventions for Taft. They are not in the classified service—though Mr. Roosevelt has said that they ought to be there, and it has been a professed purpose of his Administration to "retain fourth-class postmasters during good behavior." The rejection of the Ohio workers for Taft, however, leaves Mr. Roosevelt with no possible ground of complaint. He has always "played the game," in the sense of admitting the right of the two Republican Senators from any State to control the patronage. Consequently, when Foraker and Dick caught him playing unfair, they were entitled to expose and defeat him. If there were any Senators from New York, he might similarly be opposed here; but Platt and Depew are evidently not worth, in the President's mind, even the tossing of a coin to decide appointments.

But the whole matter goes far beyond the mere question of Senatorial "courtesy," or even of technical compliance with the rules governing appointment to office. The gravest abuses of the spoils system have had to do with the use of the offices after they are filled. All civil-service reformers, Theodore Roosevelt at their head, have contended that Federal officials, no matter how they got their offices, should not be allowed to meddle with politics. The classic statement of this view was made in the executive order which President Hayes issued on June 22, 1877: "No officer should be required or permitted to take part in the management of political organizations, caucuses, or conventions, or election campaigns." Substantially the same order has been promulgated by President Roosevelt himself, and Federal officials in Philadelphia have been removed for disregarding it. But what do we see to-day? The whole Federal service is, as Senator Foraker expressed it, being "prostituted in order to carry out political bargains." In Ohio, and notoriously in New York, not only are appointments made as a means of helping Taft and hurting Hughes, but Federal officials are taking an active part in political manipulation. For example, at the meeting in this city last Thursday night twenty out of the thirty-five district leaders of the Republican County Committee stood by President Herbert Parsons in opposing a vote of endorsement for Hughes. Seven of the twenty were Federal employees. This may not be as "naked" a proceeding as the effort of a spoilsman to "beat" the civil-service rules, but it is flatly in violation of the President's own orders, and is in clear opposition to the whole spirit of civil-service reform, to say nothing of political decency. In 1879, President Hayes suspended the collector and the naval officer of New York for having defied his executive order and having used the Custom House "to manage and control political affairs." "Their offices," said Hayes, "have been conducted as part of the political machinery under their control." Imagine President Roosevelt taking that stand to-day! It would break overnight President Parsons's control of the County Committee.

We are not blind to all that President Roosevelt has done to advance the cause of civil-service reform. Our praise of him on this score has been ungrudging, and we would not recall a word of it. The Civil Service Reform League has more than once complimented Mr. Roosevelt on his successive advance steps in purifying the public service. But here we come upon the old anomaly, or mystery, in Mr. Roosevelt's character. When he wants a thing, he goes straight for it, undeterred by any scruple or sense of awkwardness arising out of his former positions and utterances. Just now, he is bound to nominate Taft, and, as the political use of the offices seems a good road to that goal, why, he follows it without a moment's hesitation. This is one difference between Roosevelt and Bismarck. The latter scorned "principles"; they merely hindered you from doing what you desired. President Roosevelt delights in principles, only he does not let them hinder him. What he is doing now to rally Federal employees and set them to work like beavers for Taft is of the very essence of the spoils system. The fact that this is done by one of the most vociferous civil-service reformers going, is really too thin and ragged a cloak to cover the nakedness of the transaction.

HINDUS IN THE TRANSVAAL.

Brief dispatches have been telling us of the disturbances in the Transvaal growing out of the presence of British Indians in that self-governing colony. We have read of Hindus being arrested and threatened with deportation. The agitation is both alarming and mounting; and has its echoes in England, where the Imperial relations of the matter are doubtless more clearly perceived than in South Africa. In the Transvaal, this is not a question on which Boer and Briton take different sides. The colonists of British descent are as determined as the Dutch to make of the Transvaal "a white man's country." Hence we have the anomaly of men who, a few years ago, wanted to go to war with Kruger for his dislike of Uitlanders, themselves creating a class of Uitlanders whom they would expel from the land.

It is not a case of keeping out undesirable aliens. The Hindus are already there; and the question is of their treatment, not only as human beings, but as British subjects. The Imperial authorities have not challenged the right of self-governing colonies to pass exclusion acts. The attitude and legislation of Australia and Canada on that subject being what they are, the privilege of the Transvaal to decide what kind of immigration it would allow could not be denied. But it is a horse of another color when British Indians already settled in a self-governing colony are dealt with in a discriminating and unjust manner. It is estimated that there are some 10,000 Hindus in the Transvaal. That they are exceedingly industrious and inoffensive morally is conceded. But they are very keen traders, and 5,000 of them have from the government a license to trade. The main objection to their presence comes from those, both Dutch and British, who allege that they cannot endure Hindu competition in the small trades. Gunga Din is proving too much for slippery Joe from Brummagem, or "slim" Piet of the veldt!

The present and particular grievance of the Indian residents of the Transvaal is a law compelling them to take out fresh registration papers. They had all been registered once. This was done, on the advice of Lord Milner, before self-government was granted to the Transvaal; and the Hindus were assured by him at the time that "that registration would be final." But the colonial government has passed an act compelling re-registration, and that under humiliating conditions. In taking out new certificates, the Hindus must submit to the tests used for criminals, including finger-marks. The aim may have been partly sincere, to prevent false permits, and to detect fraudulent registration; but a secondary object was undoubtedly to infuriate or intimidate the Indians. This was practically admitted by the Colonial Secretary, Mr. Smuts, who said in his speech at Pretoria the other day that since the passage of the act at least 5,000 Asiatics had left the colony in a fright. On the other hand, many of the more self-respecting Hindus have refused to register, asserting that the law was both degrading to them and in derogation of their established rights as British subjects. Certainly, there could be no more direct way of affixing to them what Mr. Morley has called "the bar sinister of inferiority."

To have this difficulty arise at the very moment when the troubles in India are themselves so serious is highly embarrassing for the English government; for the news from the Transvaal cannot fail to make the educated natives in the Punjab more doubtful of British fair play for their race. And the agitation has come to give a sardonic turn to previous pledges and boasts of British statesmen. At the Colonial Conference of 1897, Mr. Chamberlain, then Colonial Secretary, declined to enter into schemes for the restriction of emigration, on the specific ground that outrages might be inflicted upon the 300,000,000 of British subjects in India. They were, he said, "as loyal to the Crown as you are yourselves"; and he, for his part, could not consent to anything which would put "a slight" upon men who had "brought whole armies and placed them at the service of the Queen." This latter tribute might be made stronger to-day. Natal was saved by troops from India; Indian soldiers marched to the relief of the British legation at Peking; the Sikhs averted disaster at Suakim. And what rubs salt into the wounds of British Imperialists to-day is the fact that one of their grievances against the rule of the Dutch in the Transvaal was the treatment of Hindus. Thus Lord Lansdowne said in 1899:

> A considerable number of the Queen's Indian subjects are to be found in the Transvaal, and among the many misdeeds of the South African Republic I do not know that any fills me with more indignation than its treatment of those Indians. And the harm is not confined to the sufferers on the spot; for what do you imagine would be the effect produced in India when these poor people return to their country to report to their friends that the Government of the Queen-Empress, so mighty and irresistible in India, with its population of 300,000,000, is powerless to secure redress at the hands of a small South African State?

The effect can scarcely be less to-day, one would think, when hardships at least as great as those of the days of Kruger are suffered by the King's Indian subjects in a colony owning allegiance to the Emperor of India.

With these mortifying inconsistencies, Imperialism is all the while being brought up short. It professes to be going forward to bless the world with a policy of all-embracing justice. Freedom and self-government it cannot promise, but fair and equal treatment it does. Yet it finds that the ugly prejudice of race and color is ever and again nullifying its fine words. There is no magic in the word Imperial to make men abandon greed and deal with a fellow-being as an equal before the law and in the sight of God. And whether we call ourselves Imperialist or parochial, there is not much for it but to get it into our heads and our hearts that it is infinitely mean to despise a man, and refuse to give him a fair chance, merely because he is poor or black.

THE WORK OF THE CARNEGIE FOUNDATION.

The second annual report of President Henry S. Pritchett of the Carnegie Foundation for the Advancement of Teaching discusses many topics of general interest, such as "The Evolution of the American Type of University" and "The Relation of Efficiency to Cost in Colleges and Universities." Nothing, however, is more significant than those passages which tell—sometimes indirectly—the effect which the Carnegie Foundation has already begun to exert upon higher education in this country. In two ways the pressure of this vast fund is producing beneficial results: in raising standards of scholarship and in freeing colleges from sectarian ties.

The Foundation refuses retiring allowances to professors in institutions which do not require for admission a preparation represented by fourteen "units" of study. There, are, especially in the South and West, many schools, called colleges or universities, whose standards are deplorably low. This shortcoming may be ascribed to a variety of causes: the schools of the community often cannot afford an adequate preparation, and the colleges have to take such students as they can get. But frequently there has been a competition for numbers, especially between colleges of rival religious denominations; and in this struggle one easy way to win is to put down the entrance requirements. But the Carnegie Foundation proposes that such competition shall at least not be destructive; that a college shall not consider its fortunes "as a matter unconnected with the general system of education and without relation to the interests of the whole body of American students." For example, Dickinson College has within the year been put upon the list of accepted institutions. Its requirements for admission "were slightly below fourteen units"; but "these deficiencies were promptly removed by the action of the faculty." Bates College also "readily agreed" to raise its requirements. Washington and Lee has been making a "series of advances covering several years," and by 1909 it "will require the full fourteen units." The Foundation, we may note, does not specify any particular studies, or lay upon the colleges a cast-iron regimen. There may be as wide variation as ever between institutions and between individuals in the same institution. The only point on which the Foundation insists is that a college shall not be a mere high school.

The questions as to sectarian control have been more difficult to handle because the ties between colleges and sects are so various. The commonest form seems to be a charter provision that the trustees, or a fixed proportion of them, shall belong to a certain sect or to a group of sects—say, the Evangelical. In some cases the trustees may belong to any, or no, denomination, but the choice of trustees rests with a sectarian body. For example, the trustees of Georgetown College, Georgetown, Ky., are elected by members of the Baptist Education Society of Kentucky; and one-fourth of the trustees of Wesleyan University, Middletown, Conn., are elected by Methodist conferences in New York and New England. Institutions subject to such sectarian control, direct or indirect, are not admitted to the benefits of the Foundation. And rightly, we believe; for though the college may be liberal in temper, yet so long as it maintains a legal connection with a denomination for the sake of securing financial aid or more students, it is in so far forth sectarian. It cannot eat its cake and have it too. On the other hand, there are colleges—like Princeton and Yale—whose relationship with a sect "is one of tradition and sympathy, and the Foundation is not concerned with the fact that a given college was founded under the auspices of a religious organization, or that it retains to-day a sympathetic relation with it." To avoid misunderstandings, however, the Foundation asks that when these colleges are entered in church year-books, they appear in a list apart from the "official" under the following heading:

> The following institutions are not connected with the —— church by any legal ties, nor are they subject to its control. Their history, however, and associations with the life and work of the church are such as to justify our earnest coöperation with them.

The effects of this policy are already visible. Presidents of colleges and universities and editors of year-books have "willingly coöperated in this change." Thus Dickinson College has been removed from the "official list" of educational institutions of the Methodist Episcopal Church; and Randolph-Macon Woman's College, though founded under Methodist auspices, has in a similar way defined its independence. Bates College, Lewiston, Me., had been controlled by the Free Baptists, but in 1905 the Legislature restored the college "to its original undenominational status."

This movement toward unsectarianism we cannot but regard as wholesome. Without in the least undervaluing the services to education of the sects which have founded and maintained schools and colleges, we are convinced that a college is hampered by any form of sectarian control. Whenever scientific investigation and the tenets of the denomination come into conflict, the latter are too likely to prevail, or at least to restrict the scientists; among teachers and officers loyalty to the denomination may count for as much as professional skill. On this point President Pritchett's report throws interesting light. He notes that it is doubtful "whether those whose primary object is to save men's souls are the best qualified for training their minds." He has asked for "the opinion of those in charge as to the effect of denominational connections in the conduct of the organization"; and "almost without exception the conviction has been expressed" that such connection "is not a help in the organization of a college, and that denominational control is nearly always a source of organic weakness." The grounds upon which such connections and control are defended are:

> First, a belief that such institutions are more likely to be conducted by strictly religious men than other colleges; second, the financial assistance obtained from the denomination; third, and perhaps most influential of all, a desire for a constituency to which to appeal for students.

We hope, however, that with the makeweight of the Carnegie Fund thrown into the balance, our colleges will be more and more constrained to rely on intellectual rather than religious resources to attract students; in short, that they will pursue more strictly their aims as institutions of higher learning.

SCIENCE AND POETRY.

The late French astronomer, M. Janssen, was not only a great scientist, but a writer of no little distinction. He kept his mind open to literature as few men are able to do whose lives are devoted to absorbing technical work; and the union of science and love of letters, which he illustrated in his own person, was a theme on which he often dwelt. In particular, he resented the common assertion that the spirit of science is hostile to the spirit of poetry. The Paris *Figaro* recently printed a posthumous article from his pen, sustaining the thesis that science and poetry represent "the two greatest manifestations of the human spirit," and arguing that the time is now ripe for their "beautiful and fruitful" alliance. As an example of what M. Janssen conceived to be the strong appeal of scientific truth to the imagination, he gave an account of an experience of his own with Gounod. That great musician might certainly be cited as a man of the poetic temperament. He sought out Janssen to ask for a few lessons in the higher astronomy. One day, the discourse fell on Kepler's laws, and as Gounod grasped their theory, he was so much moved that he exclaimed: "How beautiful!" and burst into tears.

Such personal incidents, however scarcely go to the root of the difficulty. Great natures and great poets, from Lucretius down, have been profoundly impressed by scientific discoveries and speculations regarding the universe and the soul of man. But that fact does not meet the real charge that science is hostile to poetry. It is not that scientific conceptions, such as the reign of the iron laws of nature, and the struggle for existence, are in themselves recalcitrant to poetic treatment. They may be found underlying many great poems. But it is the peculiarly scientific attitude that eats into the heart of the poet and extinguishes his enthusiasm. To the poet nature and law must be seen through the medium of human hopes and fears, they must be transmuted into emotion and personal equivalents; whereas true science begins just when these media of ideas have been laid aside. The instance of Tennyson is frequently adduced to the contrary, and indeed no poet appears to have followed more closely the scientific movements of his age. But it is also true that when consciously he writes as the interpreter of science he ceases to be a poet. Who does not recall the jargon of "Locksley Hall Sixty Years After":

> Evolution ever climbing after some ideal good,
> And Reversion ever dragging Evolution in the mud.

So far as science wrote itself in Tennyson's verse, the result fell far short of M. Janssen's dream of a poetry transfigured and made at once more vital and more beautiful by blending with the scientific spirit. Janssen could cry out, in one of his lectures on the chemistry of the heavens, "Oh, star, send me one of thy rays, and I will write thy history!" But in his observatory, as a man of science, he must have thought more of the mechanism of the telescope than of any personal appeal to the heavens. He may have been poet and scientist, but scarcely both at the same time.

The fact remains, nevertheless, that men will be ever seeking the human interpretation of life, and the imaginative presentation of truth. Indeed, it is the function of poetry so to make life and truth vividly apprehended. Hence, as the domain of science is extended, the demand will be heightened for poets who can reconquer it for the imagination. This is the feeling which underlies Clough's "Come, Poet, Come!" To teach emotionally what others attain by self-denying labor is the way to "make their meaning clear in verse." If science is to win its way to the inner soul of mankind, it will need a poetry suffused with its spirit, but capable still of making its message personal. It is doubtless true that if a poet shall ever arise who is imbued with the methods and the results of science, he will be compelled to depart from some of the older conventions. He will surely have fewer hymns to write to the individual, and more to the commonalty; will summon to a combat which is the sterner for the immutable laws of nature. But he will never cease to weave into his verse those human feelings and those deep-seated virtues which, though beyond the reach of chemic test, are still among the most indubitable affirmations of science:

> To defy power which seems omnipotent;
> To love and bear; to hope till hope creates
> From its own wreck the thing it contemplates;
> Neither to change, nor falter, nor repent.

PATRIOTIC SONGS AND THEIR MAKING.

The death last week of James Ryder Randall, author of "Maryland, My Maryland," has called attention to the paradox that the Southern Confederacy should have derived so much lyric enthusiasm from an appeal to a State which did not secede, after all. That fact should have been a reason for taking its sentiment a trifle less seriously; yet it had no such effect. The song was ringing, manifestly sincere, and it was adapted to a German tune that is one of the best in the world. Nothing more was needed, and Southern sympathizers went on singing with tears in their eyes:

> She'll come, she'll come,
> Maryland, my Maryland,

long after it had become clear that Maryland was not coming.

Yet this is neither more nor less absurd—if it be at bottom absurd at all—than the contradictions to be found in the history of most patriotic songs. Every one knows that the melody of the "Star-Spangled Banner" belonged to an old English drinking song:

> To Anacreon in Heaven, where he sat in full glee,
> A few sons of Harmony sent a petition,
> That he their inspirer and patron would be, etc.

But the words of the "Star-Spangled Banner," stirring as they are, can be contrasted rather ludicrously with the events they commemorate. No doubt the stanzas written by a prisoner of war, who was actually straining his eyes through the night to see if the flag were still flying, had an almost ideally inspiring origin. But, as the editor of *Scribner's* recently pointed out, the song is supposed to commemorate about the most inglorious campaign in which American arms were ever engaged. Only a little while before the song was written the Free and the Brave had run away from Washington, leaving it for the President's wife to save even the White House portraits, and letting the Hireling and Slave burn down the Capitol.

There is no need for more than a reminder that "Dixie" was written by the comedian of a Northern minstrel show—"Dixieland" itself, according to some authorities, being named after a slaveholder here on Manhattan Island; that "Yankee Doodle" is "Lydia Fisher's Jig" of the time of Charles II.; and that some historical muckrakers have satisfied themselves of the German origin of the Marseillaise, and of the French origin of certain German national songs. On the other hand, few songs of unimpeachable origin and strictly logical sentiment ever find their way into the same vogue. Several times in this epoch of magazines, some large-minded editor has commissioned a leading poet and a leading composer to collaborate in filling a long-felt want with a patriotic song that should be purely and everlastingly American. Some years ago one of the State branches of the Society of the Cincinnati received, in response to a request, 517 new airs for "My Country 'tis of Thee." We confess complete ignorance as to the result of any of these praiseworthy efforts. "Cursed is the war no poet sings." Nevertheless, if history be any guide, the poet who desires to sing a war will improve his chances of immortality by expatriating himself and singing some other country's war, or at least borrowing the tune from his country's foeman, or picking out some episode in which his country had distinctly the worst of it.

This is a condition which may be deplored, yet cannot apparently be changed. It offers a singular contrast to the business-like methods of modern war. The fact is eternally impressed upon us that preparations for even the most remote conflict cannot begin too soon, that it is the best organized commissariat which really wins the battles, that patriotism is of no use unless Congress votes some scores of millions to equip it. The day is past when peasants can pick up flails and scythes and rush out to defend their homes from the invaders; or when the minute man can be called from the field, reach behind the door for his musket, and hurry off to fight. Yet even now, after the arsenals and the shipyards have done their part, something is still requisite for a successful war. Congress has neglected to provide the songs for the men! On this one point warfare remains impromptu. Some poet wakes up in the middle of the night and tumbles out of bed with a song, as Randall did to write "Maryland, My Maryland." Or if the poet is a sluggard, the soldiers levy on civilians just as they do for provisions. In the Civil War they found a Methodist camp-meeting tune and extemporized the words of "John Brown's Body," which are not without a sort of rude dignity. In the Spanish war they found a "coon song," "There'll Be a Hot Time in the Old Town To-night," and did not even try to put it under military discipline. It is said that newspaper readers on the continent of Europe were perplexed when they read in 1898 of victories celebrated by the singing of "Il fera très chaud dans la ville ce soir." But their perplexity was both in degree and in kind like that of the American who read in the accounts of the last Thibetan expedition about the firing of "Jingals from a Jong." Americans and Tibetans alike, caught unprepared, had seized the best makeshift they could, the one a piece of music, the other a piece of ordnance.

KIPLING AS A POET.[*]

The issue of a collective edition of Kipling's verse comes opportunely with the award to him of the Nobel prize for idealism in literature. Though the committee must have reckoned into the account all his writing, his poetry is presumably the chief item; and here we have it in convenient form for reading, comparison, and criticism. The volume contains the matter in "Ballads and Barrack-Room Ballads" (with additional poems), 1893; "The Seven Seas," 1896; and "The Five Nations," 1903. Mr. Kipling has not reprinted the bits of verse scattered through his stories, and he has omitted a considerable number of the pieces in "Departmental Ditties, Barrack-Room Ballads, and Other Verses," widely circulated in this country in 1890. Most of these early "Barrack-Room Ballads" have been saved; none of the "Departmental Ditties," and but few of the "Other Verses." Mr. Kipling's willingness to let the "Departmental Ditties" die is easy to understand: while they are always smart and sometimes clever, they are, without exception, immature and trivial. Yet they throw no little light on his development. Most of the "Other Verses" equally merit oblivion; and yet we must regard "The Ballad of Fisher's Boarding-House," "The Grave of the Hundred Head," and "The Galley Slave" as worthy of place with much of his later production.

I

In this 'prentice work which he has consigned to oblivion, he tries his hand, as is wholesome and proper in an aspiring poet, at various metres—bits reminiscent of W. S. Gilbert, Bret Harte, FitzGerald, Will Carleton, and C. S. Calverley. But Kipling's versification has received its deepest impress from that great master of sheer verbal melody, Swinburne. This is the craftsman whose elaborate alliterations and assonances, as well as sentiment, the younger author has studied most assiduously.

This is not to say, of course, that Kipling is a mere echo. One of the qualities, indeed, which brought him such instant popularity was a certain originality both of manner and matter—an originality which seems greater perhaps than it really is, because the effect of all that Mr. Kipling says, either in prose or verse, is heightened by an extraordinary terseness and vigor of phrase. This power of swift and vivid expression appears in his earliest writings. He was only twenty-five when in "The Ballad of the King's Jest" he gave that dazzling description which was thought to offer rich promise of future performance:

In a turquoise twilight, crisp and chill,
A kafila camped at the foot of the hill.
Then blue smoke-haze of the cooking rose,
And tent-peg answered to hammer-nose;
And the picketed ponies, shag and wild,
Strained at their ropes as the feed was piled;
And the bubbling camels beside the load
Sprawled for a furlong adown the road;
And the Persian pussy-cats, brought for sale,
Spat at the dogs from the camel-bale;
And the tribesmen bellowed to hasten the food;
And the camp-fires twinkled by Fort Jumrood;
And there fled on the wings of the gathering
dusk
A savour of camels and carpets and musk,
A murmur of voices, a reek of smoke,
To tell us the trade of the Khyber woke.

In this kind of composition we must admit, however, that his latest volume shows little or no advance. The execution is as brilliant as ever; but custom has staled us and we are no longer astonished. A fair parallel is with the first four stanzas of "Bridge-Guard in the Karroo," dated 1901:

Sudden the desert changes,
The raw glare softens and clings,
Till the aching Oudtshoorn ranges
Stand up like the thrones of kings—

Ramparts of slaughter and peril—
Blazing, amazing, aglow—
'Twixt the sky-line's belting beryl
And the wine-dark flats below.

Royal the pageant closes,
Lit by the last of the sun—
Opal and ash-of-roses,
Cinnamon, umber, and dun.

The twilight swallows the thicket,
The starlight reveals the ridge;
The whistle shrills to the picket—
We are changing guard on the bridge.

In fine, as one reads through this collection just issued, one is forced to the conclusion that though in the fourteen years from 1889 to 1903 Kipling has extended somewhat the range of his rhythms and metres, and has become more fluent, dexterous, and practised, yet in what is for most poets the critical age, his development in the art of versification has been surprisingly slight.

II.

This, his admirers will reply, is only another way of pointing out a precocity that fitted him at twenty-five with a technique which most poets would be glad to have acquired at forty. Almost from the beginning he had perfect command of the means of expression. The important question then relates to his development as a thinker; for verse without thought is, after all, as sounding brass or a tinkling cymbal. What then are the great and inspiring ideas to which Mr. Kipling's almost miraculous gift of tongues has given currency? In answering this question, we think it fair to turn for a moment to some of the "Departmental Ditties" which he has disowned. His dissatisfaction with these children of his brain must be due to their shallow conception quite as much as to their feeble execution. Like some of the "Plain Tales," they are very cheaply cynical. The prevalent mood is of tolerance if not admiration, of sheer unscrupulous smartness. There was Sleary, with his simulated fits; and the young man who caught "the spouse of Sir Julian Vouse" in an indiscretion, held his tongue, and received promotion. In these vivacious skits in verse moralizing would be wholly out of place; we do not ask for it. Our complaint is that their defect is the same as that of the Restoration comedy: the author seems to regard all sorts of malicious trickery and even adultery as merely, or at least chiefly, funny. Many of these pieces strike one as the utterance of an astoundingly clever man who, if he has a conscience, at any rate lacks a delicate sense of propriety and honor. This flaw does not, we may note, mar the light verse of, say, Thackeray or Dobson. Yet in fairness to Mr. Kipling, we must say that among these poems that paint a world of sharpers, debauchees, and their paramours, is one that strikes a graver note. At the end of a modern version of the story of David and Uriah comes the stanza:

---

[*] *Collected Verse of Rudyard Kipling.* New York: Doubleday, Page & Co.

> And. when the Last Great Bugle Call
> Adown the Hurnai throbs,
> When the last grim joke is entered
> In the big black book of Jobs,
> And Quetta graveyards give again
> Their victims to the air,
> I shouldn't like to be the man
> Who sent Jack Barrett there.

Though Mr. Kipling has long since outgrown that mood of boyish and irresponsible cynicism, he has too often, even in his later writings, preserved his old attitude as worshipper of mere mental dexterity or physical prowess. These are splendid qualities; but they are not, as Mr. Kipling sometimes seems to imagine, the most divine attributes of humanity. We have no quarrel with his "first-class fighting man," but even that resourceful creature is not the intellectual and moral flower of our race. We may pass over with few words his multitude of smaller heroes, with their strong right arms and their indomitable pluck in hewing paths through the wilderness and ploughing the pathless sea—for the glory of Britain. All these minor pioneers and patriots are swallowed up in Cecil Rhodes, who united the mind and energy of a superman with the conscience of a buccaneer. It is profoundly significant of Mr. Kipling's spiritual limitations that he seems to regard Mr. Rhodes's character as wholly admirable. Here are two of the stanzas on the death of that exploiter of South Africa:

> Dreamer devout, by vision led
> Beyond our guess or reach,
> The travail of his spirit bred
> Cities in place of speech.
> So huge the all-mastering thought that drove—
> So brief the term allowed—
> Nations, not words, he linked to prove
> His faith before the crowd.
>
> . . . . .
>
> There, till the vision he foresaw
> Splendid and whole arise,
> And unimagined Empires draw
> To council 'neath the skies,
> The immense and brooding Spirit still
> Shall quicken and control.
> Living he was the land, and dead,
> His soul shall be her soul.

This, though noble in style, is morally of a piece with his thin jingo rhymes and his strident patriotism. As a rule he fails to look beyond the immediate demands of Imperial policy and the views of Kitchener and his fellows of blood and iron. Their aims and their will Mr. Kipling accepts as the tables from Sinai. He seems scarcely to conceive of a higher mission than to "Take up the white man's burden," that is, subdue the earth in the name of our Blessed Saviour, the Anglo-Saxon. Naturally, the Boer war inspired some of the most frantic of his lyric outbursts, yet there were moments when the fife and drum did not drown all other sounds. There was the lucid interval of the "Hymn before Action" and the "Recessional," so different in tone from his shrill glorification of brute force and British power.

III.

But despite these exceptions and deductions there remains much that is impressive in Mr. Kipling's output. His descriptions, as we have already said, are extraordinarily swift and vivid. It would be easy to quote pages of brilliant writing in this kind. Moreover, he has carried into verse the narrative skill of which he has given such notable exhibitions in prose. We need but mention "The Ballad of East and West," "The Ballad of the King's Jest," "The Ballad of the King's Mercy," "The Last Suttee," and "The Rhyme of the Three Sealers." Then, too, among his contemporaries he is eminently the poet of Nature in her more tremendous aspects. In his feeling for the sea he stands almost with Swinburne; in his feeling for the mountains, he is among living Englishmen, alone. His marines, if we may use that term, rank among his finest pieces. No man can sail up the English Channel, for example, without acknowledging the exquisite aptness of "The Coastwise Lights":

> Our brows are bound with spindrift and the weed is on our knees;
> Our loins are battered 'neath us by the swinging, smoking seas.
> From reef and rock and skerry—over headland, ness, and voe—
> The Coastwise Lights of England watch the ships of England go!
>
> Through the endless summer evenings, on the lineless, level floors;
> Through the yelling Channel Tempest when the siren hoots and roars—
> By day the dipping house-flag and by night the rocket's trail—
> As the sheep that graze behind us so we know them where they hail.
>
> We bridge across the dark, and bid the helmsman have a care,
> The flash that wheeling inland wakes his sleeping wife to prayer;
> From our vexed eyries, head to gale, we bind in burning chains
> The lover from the sea-rim drawn—his love in English lanes.

Mr. Kipling is also peculiarly felicitous in his interpretation of what we may call the life of the inanimate. He tells us the things a ship would say if it suddenly found itself with a mind and tongue. In this direction he has exercised his imagination abundantly. We have just quoted an utterance of the Coastwise Lights; in similar vein are "The Deep-Sea Cables," "The Merchantmen," and "The Bell Buoy." We might also cite "The Song of the Banjo"; but a more notable poem is "The Derelict." It shows, perhaps, a more refined and delicate perception than most of Kipling's verses; and refinement and delicacy are all too rare in Kipling:

> I was the staunchest of our fleet
> Till the sea rose beneath our feet
> Unheralded, in hatred past all measure.
> Into his grip he stamped my crew,
> Buffeted, blinded, bound and threw,
> Bidding me eyeless wait upon his pleasure.
>
> . . . . .
>
> For life that crammed me full,
> Gangs of the prying gull
> That shriek and scrabble on the riven hatches!
> For roar that dumbed the gale,
> My hawse-pipes' guttering wail,
> Sobbing my heart out through the uncounted watches!
>
> Blind in the hot blue ring
> Through all my points I swing—
> Swing and return to shift the sun anew.
> Blind in my well-known sky
> I hear the stars go by,
> Mocking the prow that cannot hold one true!
>
> . . . . .
>
> I that was clean to run
> My race against the sun—
> Strength on the deep—am bawd to all disaster;
> Whipped forth by night to meet
> My sister's careless feet,
> And with a kiss betray her to my master!

From the inanimate dumb to the animate but still dumb is an easy step; and for this kind of interpretation, too, Kipling has extraordinary aptitude. We need not quarrel with his animals because they are merely human beings in strange guise. That convention we may accept without difficulty in reading the songs scattered through the two "Jungle Books." The "Seal Lullaby," for instance, is not less graceful and tunable because the mother who sings it is really human:

> Oh! hush thee, my baby, the night is behind us.
> And black are the waters that sparkled so green.
> The moon, o'er the combers, looks downward to find us
> At rest in the hollows that rustle between.
> Where billow meets billow, there soft be thy pillow;
> Ah, weary wee flipperling, curl at thy ease!
> The storm shall not wake thee, nor shark overtake thee,
> Asleep in the arms of the slow-swinging seas.

And the next step up the ladder takes Kipling to the region where he seems most at home—the heart of men of primitive instincts and desires. He delights to tell us how people felt in the Neolithic age; he speaks with the tongue of rough sailors, impelled by an overmastering *Wanderlust* to the remotest corners of earth, the men who "cannot use me bed too long"; and, above all, he is the mouthpiece of the British common soldier. Nearly a third of the present volume, for example, is made up of "Barrack-Room Ballads"; while many of the other poems are presented as the utterance of men of the same type. His success in this delineation is indisputable. Sir Anthony Gloster in "The Mary Gloster," repellent though he may be, is firmly drawn and veritable; and so is Mulholland of "Mulholland's Contract"; so, too, are the seven daredevils who "took the Bolivar out across the bay." But Thomas Atkins is Kipling's masterpiece. Here again we must accept the convention of what Ruskin would call the pathetic fallacy. Just as Kipling animates his ships, his sea-cables, and his buoys, and elevates his beasts to the level of human beings, so he endows his primitive men with the feeling of the poet and lover of nature. He ascribes to them the sentiments that perhaps might, but in fact seldom do, move them. Thus he translates vague uneasiness into clearly defined and articulated regret, as in "Mandalay"; half-understood dissatisfaction with the quiet life of peace at home into a clear and unmistakable longing for adventure, as in "Sestina of the Tramp-Royal" and "For to Admire." But, granted the legitimacy of this clarifying and heightening of emotion for rhetorical effect, Kipling is unmatched. Of all his verse, nothing has seized the popular fancy more than "Danny Deever," "Fuzzy-Wuzzy," "Gunga Din," and "Mandalay," all of them early productions. His later service songs have seemed as a whole less fresh and spontaneous. But at least two of them have received less attention than they deserve. The first is the "Chant-Pagan" (the lament of an English irregular, discharged), from which we quote a single stanza, showing this very vision of the sophisticated poet, to which we have just referred:

> Me that 'ave rode through the dark
> Forty mile, often, on end,
> Along the Ma'ollisberg Range,
> With only the stars for my mark
> An' only the night for my friend,
> An' things runnin' off as you pass,
> An' things jumpin' up in the grass,
> An' the silence, the shine an' the size
> Of the 'igh unexpressible skies—
> I am takin' some letters almost
> As much as a mile, to the post,
> An' "mind you come back with the change!"
> Me!

The second is the marching song, "Boots," which, men of experience say, suggests more forcibly than any other verses in our language the fatigue bordering on delirium produced by long-forced marches:

> We're foot—slog—slog—slog—sloggin' over Africa!
> Foot—foot—foot—foot—sloggin' over Africa—
> (Boots—boots—boots—boots—movin' up and down again!)
> There's no discharge in the war!
>
> Seven—six—eleven—five—nine-an'-twenty mile today—
> Four—eleven—seventeen—thirty-two the day before—
> (Boots—boots—boots—boots—movin' up and down again!)—
> There's no discharge in the war!
>
> . . . . . .
>
> Try—try—try—try—to think o' something different—
> Oh—my—God—keep me from goin' lunatic!
> Boots—boots—boots—boots—movin' up and down again,
> There's no discharge in the war!
>
> . . . . . .
>
> We—can—stick—out—'unger, thirst, an' weariness,
> But—not—not—not—not the chronic sight of 'em—
> Boots—boots—boots—boots—movin' up and down again!
> An' there's no discharge in the war!
>
> . . . . . .
>
> I—'ave—marched—six—weeks in 'Ell an' certify
> It—is—not—fire—devils—dark or anything
> But boots—boots—boots—boots movin' up an' down again,
> An' there's no discharge in the war.

IV.

But if Kipling's fame rests chiefly on his celebration of the British flag and the British soldier, we must also add that he presents two or three general ideas. In his vigor, his youth, and his enormous popularity he is often likened to Byron. The similarity, however, is superficial. Byron died at thirty-six, but he left a mass of verse that shows far wider intellectual range that all of Kipling's writing, verse and prose, put together. Kipling has given us nothing large and sustained, nothing that exhibits high skill in architectonics. From Byron we have, in addition to his numerous miscellaneous poems, "Childe Harold's Pilgrimage," eight or nine tales, like "The Giaour" and "The Corsair," eight dramas, and "Don Juan"—all of them informed with ideas; all of them, to use Matthew Arnold's phrase, a criticism of life. To compare Kipling's product with this is impossible. For besides Kipling's proclamation of the duty of conquering savage wilds and spreading Anglo-Saxon civilization, and his exposition of the heart of the unlettered soldier and sailor, his chief contribution to our stock of ideas is his theory of art; to wit, that steam and electricity cannot kill romance. On this theme he offers several variants, the best of which is "McAndrew's Hymn" in the passage beginning:

> Lord, send a man like Robbie Burns to sing the Song o' Steam!
> To match wi' Scotia's noblest speech yon orchestra sublime—

Besides this there is little beyond what we have already noted in passing. Indeed, he has never, in the best of his later verse, written anything more thoughtful than the few lines which serve as a motto for "To Be Filed for Reference" in "Plain Tales from the Hills":

> By the hoof of the Wild Goat up-tossed
> From the Cliff where She lay in the Sun,
> Fell the Stone
> To the Tarn where the daylight is lost;
> So She fell from the light of the Sun,
> And alone.
>
> Now the fall was ordained from the first,
> With the Goat and the Cliff and the Tarn,
> But the Stone
> Knows only Her life is accursed,
> As she sinks in the depths of the Tarn,
> And alone.
>
> Oh, Thou who hast builded the world!
> Oh, Thou who hast lighted the Sun!
> Oh, Thou who hast darkened the Tarn!
> Judge Thou
> The sin of the Stone that was hurled
> By the Goat from the light of the Sun,
> As She sinks in the mire of the Tarn,
> Even now—even now—even now!

This is a noble beginning for a poet who would discourse of human life with high seriousness. It would be easy to argue that since he penned those penetrating lines, Kipling's vision has been dimmed and narrowed, his utterance choked, by his furious zeal for the British flag and his microscopic study of the British soldier. On the other hand, we may doubt whether a man capable of seeing life steadily and seeing it whole would ever become the victim of such small prepossessions. But whatever the cause, the effect remains: we cannot yet rank Kipling with those poets who have won immortality by their "profound and beautiful application of ideas to life."

NEWS FOR BIBLIOPHILES.

The Shakespeare Birthplace Museum has just acquired two additional quartos, "A Midsummer Night's Dream," Roberts's edition, 1600, and "The Merry Wives of Windsor," 1619. They are the Van Antwerp copies. In announcing this addition to the library, Sidney Lee says:

> The two volumes long formed part of the famous Rowfant Library of Frederick Locker-Lampson. It will be remembered that in 1904 the whole of that splendid collection was, to the general regret, sold to a bookseller of New York, who subsequently disposed of the Shakespeareana to an American connoisseur. But the migration proved temporary. In the spring of last year the American collector resold most of the Locker-Lampson Shakespeareana in London.

Actually the first of the two, "A Midsummer Night's Dream" only, was from Locker-Lampson's library. The Rowfant copy of the second is still in New York. Of the seventeen Shakespeare items in the Van Antwerp sale, six only were from the Rowfant collection, and at least one of these, the first folio, is back again in America. Of the forty-nine Shakespeare items described in the two Rowfant catalogues, all but five are still in America, and are likely to remain here.

A new monthly magazine for book-lovers, the *Bibliophile*, will begin publication in London next March. Among the contributors are to be George Wyndham, F. T. Bullen, Arthur Symons, Cyril Davenport, Sidney Lee, A. W. Pollard, and H. B. Wheatley.

On January 24 the Anderson Auction Company of this city will sell the autograph collection of the late William C. Hess, with additions from other sources. There are included a fine A. L. S. of John Adams, written when he was twenty-one; several letters of W. C. Bryant, one mentioning "Thanatopsis"; autograph verses and several letters of O. W. Holmes; A. L. S. of Gen. Jedediah Huntington, mentioning the battle of Bunker Hill; a fine A. L. S. of J. R. Lowell; and A. L. S. of George Cruikshank, Charles Dickens, Gen. Grant, Alexander Hamilton, Marquis de Lafayette, James Madison, and W. M. Thackeray.

On January 27 and 28 the Anderson Company will sell a collection of Americana, mainly formed by Miss Nellie Malcolm of London. A considerable part of the library relates to the American Indians, and contains such books as Adair's "History of the American Indians," 1775 (uncut); Colden's "Five Indian Nations of Canada," 1755; Samuel G. Drake's "Indian Biography," 1832; Livingston's "Review of the Military Operations in North America," 1758 (uncut); Hennepin's "New Discovery of a Vast Country in America," 1698; Hopkins's "Historical Memoirs Relating to the Housatunnuk Indians," 1753; Long's "Voyage and Travels of an Indian Interpreter and Trader," 1791; McKenny and Hall's "Indian Tribes of North America," three vols., 1848-1854; Mackenzie's "Voyages from Montreal to the Frozen and Pacific Ocean," 1802; and a number of books by Schoolcraft, including the rare "Algic Researches," 1839.

On January 30 and 31 the same firm sells the library of George M. Williamson, one of the choicest collections offered for some time, and, so far, the most important sale of the season. The most notable single item is Washington's copy of "Don Quixote," four vols., with his autograph on the title page of each volume, and his book plate in vols. I., II., and IV. Washington's library contained comparatively few books which could be classed as literature, and this is one of the most interesting. The set of first editions of Robert Louis Stevenson is, perhaps, the finest in the country. Primarily, it was formed by the late C. B. Foote, who secured several rare private issues. When Mr. Foote sold his library in 1894-1895, he retained Stevenson's books and added to them from time to time. After his death, the collection was acquired privately by Mr. Williamson, who was able to extend it by items from the A. J. Morgan collection, and a series of presentation copies from Stevenson to his old nurse, Alison Cunningham, the "Cummy" of the letters. In 1901, Mr. Williamson printed, at the Marion Press, an account of his Stevenson collection. Stevenson's first book, "The Pentland Rising," 1866, has laid-in a letter to Mr. Foote, in which the author writes: "I was just sixteen in November, 1866, and the 'Pentland Rising' in a green cover is my first work, printed by a fond parent." The two scientific pamphlets, "Notice of a New Form of Intermittent Light for Lighthouses," 1871, and "On the Thermal Influence of Forests," 1873, are both presentation copies, as are the "Charity Bazaar," 1868; "An Appeal to the Clergy of the Church of Scotland," 1875: "An Inland Voyage," 1878; "Travels with a Donkey," 1879; "New Arabian Nights," 1882; "A Child's Garden of Verse," 1885; and some later books. Almost all the privately printed books are in the list, including four plays: "Deacon Brodie," "Beau Austin," "Admiral Guinea," and "Macaire"; most, if not all, of the issues from the toy press at Davos Platz; the suppressed "Story of a Lie"; the curious "Object of Pity," printed at Sydney, N. S. W., by Lady Jersey; and issues for copyright of "The Silverado Squatters," "The Master of Ballantrae," "The South Seas," and "Weir of Hermiston." The Dickens collection is notable, including a fine copy of "Pickwick," with parts i. and ii. in the earliest state, with the correct covers and variations of many of the plates; "Sketches by Boz," first octavo edition, in the original parts; "Oliver Twist," the first issue; and Dickens's own copy of "Doctor Marigold." Other English writers of whose books extended series of first editions are offered are Lewis Carroll, George Eliot, and the Brontë Sisters. Almost all the great American authors are represented, and a number of the series are long and important, especially the Whitman and the Hawthorne. Bryant, Lowell, Longfellow, Emerson, Thoreau, Holmes, and Whittier are represented by some of their scarcest books. Many later authors, such as Howells, Burroughs, Eugene Field, D. G. Mitchell, and James Whitcomb Riley, also appear, in many cases by presentation or autograph copies.

On January 28 and 29 the Merwin Clayton Sales Co. of this city offers a collection including first editions of Aldrich, Emerson, Hawthorne, Holmes, Longfellow, Lowell, Thoreau, and Whittier; books on the Revolution, Indians, Massachusetts, New Hampshire, Vermont, etc.

Correspondence.

SOME LOST FAIRY TALES.

To the Editor of The Nation:

Sir: Of the making of books there is no end indeed; and one can well imagine that a single volume of fairy tales would not be missed. Yet I have repeatedly, at the holiday season, mourned my inability to find "Rainbows for Children," published first I think in 1848, another edition being issued in 1875 by James R. Osgood & Co., Boston. These stories were printed under the name of Lydia Maria Child, who, however, entirely disclaims their authorship in the little preface to both editions. The book was beautifully finished and well illustrated, and was the delight of my earliest years; then of my own boys and girls; and finally I sought it for a little grandson, but sought in vain.

A friend recently lent me a copy, and I was greatly pleased at the impression they made upon the lad of six to whom I read them. Their charming imagery causes the most delicate ethical suggestions, but never intrudes them; and yet I have not known these to be lost upon a young reader. Would that some good publisher could offer these refined and satisfying stories to the present generation, surfeited by cheap "Teddy Bear" parodies—and weak nature studies. S. M. H. G.

Andover, Mass., January 12.

A. C. BENSON'S LITERARY ACTIVITY.

To the Editor of The Nation:

Sir: In a reference in the *Nation* of January 2 to our author, Mr. Arthur C. Benson, he is criticised for "bringing out four or five books a year." Such a statement does not do justice to the record of Mr. Benson's literary work. His first book was published anonymously some twenty years back, and since that date a number of further volumes have come from his pen which were, in like manner (with a few exceptions) published without the name of the author, or under a pseudonym. Two years ago appeared the "Upton Letters," and six months later "From a College Window." These also were originally issued under a pseudonym, but were within a few months of their publication acknowledged by the author. The books attracted widespread interest, and the author has been accepted as belonging to the group of leading English essayists. It is quite natural that the publishers of Mr. Benson's earlier books should take advantage of the repute that had been secured for his name through these later and more mature productions, and should bring again into print, connected with the author's name, all the books for which he was responsible. Some of these reprints contain attractive, and even delightful material, but it is not fair that, on the ground of the reissue by various publishers, in the course of one year, or of two years, of a group of these earlier books, the author should be charged with "bringing out four or five books a year."

G. P. Putnam's Sons.

New York, January 17.

A FRENCH SUMMER SCHOOL.

To the Editor of The Nation:

Sir: The recent appearance of the annual report of the Committee on Patronage of the University of Grenoble calls attention to an institution concerning which many of your readers may be glad to learn. For ten years public-spirited citizens of Grenoble have maintained courses of instruction in the French language and literature for foreigners during the months of July, August, September, and October. Excellent courses have been given by professors in the University of Grenoble and instructors in the lycées of Dauphiné; and the instruction has been adapted to all grades of learners. The tuition charges are nominal—eight dollars for the summer session, a fee which admits one to all lessons, lectures, conferences, social reunions, and excursions; and good board may be obtained in French families for $30 a month and upwards. Grenoble is picturesquely situted in the heart of the French Alps, and is the starting point for numerous interesting mountain excursions, thus affording an opportunity for the combination of study and recreation. Many splendid mountain peaks are within walking distance of Grenoble, and the mountain roads in Dauphiné are among the best in Europe.

American teachers and students interested in the summer school at Grenoble may obtain full information by addressing M. Marcel Reymond, Président du Comité de Patronage des Étudiants Étrangers, Université de Grenoble, Grenoble, France.

Will S. Monroe.

Westfield, Mass., January 13.

Notes.

E. P. Dutton & Co. announce for immediate publication "London Parks and Gardens," by the Hon. Mrs. Evelyn Cecil, with colored illustrations by Lady Victoria Manners; "Flower Grouping in English and Irish Gardens," with articles by the Hon. Emily Lawless, Rose Kingsley, and others, and with notes and sketches in color by Margaret Westerfield; and "Municipal Ownership," by Leonard Darwin.

The Macmillan Company has a number of notable books of verse on its spring list, including the new edition of Tennyson, a volume by Alfred Noyes, and new dramas by Stephen Phillips, W. B. Yeats, and Percy MacKaye, the last-named, however, being in prose.

On the spring list of Houghton, Mifflin & Co. we note a new book of essays by John Burroughs, entitled "Leaf and Tendril"; and a volume by Prof. Irving Babbitt of Harvard, on "Literature and the American College."

February 1, Thomas Y. Crowell & Co. will bring out "Thomas Alva Edison, Sixty Years of an Inventor's Life," by Francis Arthur Jones; also three new volumes, "The Tempest," "Othello," and "The Winter's Tale," in the First Folio edition of Shakespeare.

Thomas D. Murphy has written a volume of travel called "British Highways and Byways from a Motor Car," which is so well provided with maps and comments on the roads as to make it practically a guide book for motoring in Great Britain. It will be published by L. C. Page & Co.

Under the title of "A Family Chronicle," John Murray is issuing a volume of reminiscences of Fanny Kemble, Bulwer Lytton, Lord Lynedoch, "Bobus" Smith, and other luminaries of the last century.

Darling & Pead (32 Harrington Road, South Kensington) are preparing a privately printed book of letters called "Brougham and His Early Friends." The work, to occupy three volumes, is edited by R. H. M. B. Atkinson and G. A. Jackson.

Edmund G. Gardner is preparing an edition of "Dante's Lyrical Poems," which will construct a critical text of the fifteen *Canzoni* and include a study of mystical and erotic poetry. It will be published by Constable & Co.

To the excellent Tudor & Stuart Library, published by Henry Frowde, are soon to be added Thomas Wilson's "Arte of Rhetorique" (1553) and George Turberville's "Noble Arte of Venerie or Hunting" (1576).

William J. Locke has resigned his position as secretary of the Royal Institute of

British Architects, and is going to Africa in order to be free to complete the novel he has on hand. In the spring John Lane Company will issue a uniform edition of his works in ten volumes.

With the March number *Putnam's Monthly* will be combined with the *Reader*. The new magazine will carry the name of both periodicals, and will bear the imprint of G. P. Putnam's Sons, New York and London, and the Bobbs-Merrill Co., Indianapolis.

Two reprints from the Clarendon Press are worthy of mention. One is the "Golden Treasury" now issued in the Oxford Edition, with the addition of a hundred poems from Americans and from writers who were living when Palgrave made his famous anthology. Browning has quite the lion's share in this supplement. Another reprint is of Sidney's "Apologie for Poetrie" from the Olney edition of 1595, with an introductory "Memoir of Sidney" and notes by Prof. Churton Collins. It is an excellent edition for school use.

A new book that every teacher of composition should masticate is "The Writing of English," by P. J. Hartog (Henry Frowde). Apparently, it has grown out of an able paper by the same hand, "The Teaching of Style in English and French Schools," which appeared six years ago in the *Fortnightly Review*. Mr. Hartog approaches his subject from the historical as well as the practical side, showing, after the fashion of Brunetière, that the French mastery of style is not fortuitous, but is the direct result of tangible efforts, and of methods in education that with little change might be introduced into the primary and secondary schools of England. His assumption that American schools are superior to English in the teaching of the mother tongue we are inclined to discount. Substituting the words "American boy" for "English boy" we may render Mr. Hartog thus: (1) The American boy cannot write English; (2) the American boy is not taught to write English; (3) the French boy can write French; (4) the French boy can write French because he is taught how to write. The optimist then gives (5) historical reasons for the foregoing facts, telling us (6) how the French boy is taught to write, and (7) how the American boy may be taught to write. The book is a distinct contribution to the history of style.

Thomas J. Wise, the English collector and bibliographer, has just printed privately, thirty copies only, a little volume of thirty-four letters of Robert Browning to various correspondents, including Professor Dowden, Robert Buchanan, John H. Ingram, and F. J. Furnivall. A facsimile of a letter to Christopher Dowson, about 1830, forms a frontispiece; it is supposed to be the earliest letter of Browning extant. A second volume is promised in about three months. Mr. Wise printed a similar series of two volumes in 1896.

The Lincoln Fellowship has printed privately one hundred copies of "Lincoln and the New York *Herald*," being facsimiles of two letters written by Lincoln in August, 1860, addressed to George Fogg, in reference to a statement made in the *Herald* that Lincoln feared being lynched if he visited Kentucky. The two letters now belong to Judd Stewart of Plainfield, N. J., who writes the Introduction. With these two letters to Fogg are reprinted four letters to Samuel Haycraft, in one of which Lincoln jocosely wrote, in reply to an invitation to visit his birthplace: "But would it be safe? Would not the people lynch me?" This was probably the basis of the *Herald's* statement, and is referred to by Lincoln in his letters to the paper.

In various ways Montrose J. Moses has made himself an authority in juvenile literature, and his volume on "Children's Books and Reading" (Mitchell Kennerley) may be trusted as a safe guide in a problem that becomes yearly more difficult. He neglects neither the literary and purely imaginative appeal to the child's mind, nor the influence of all reading on character. Thus, after quoting the correspondence between Godwin and Charles Lamb in regard to certain brutalities to be expunged from Lamb's adaptation of the Odyssey, and alluding to Felix Adler's and W. D. Howells's oversensitive dread of any "relic of ancient animism," he adds, judiciously:

> A mushroom growth of story-writers, those who "tame" our fairy tales, who dilute fancy with sentimentalism, and who retell badly what has been told surpassing well, threatens to choke the flower. It is not the beast man in classic literature we have to fear so much as the small man of letters, enthused ["an ill phrase, a vile phrase"] by the educational idea, who rewrites to order, and does not put into his text any of the invigorating spirit which marks all truly great literature.

Besides this discussion of the present problem, Mr. Moses treats the growth of children's books historically, and adds a useful bibliography. There must be room for legitimate difference of opinion in the details of such lists, and we take advantage of the omission of George Macdonald's "Ranald Bannerman" to call attention here to what we have always regarded as one of the best boys' books ever written.

Two pleasant books made up of old-time gossip and tradition, compiled by women having an eye for the picturesque, with numerous attractive pictures, are: "Little Pilgrimages Among Old New England Inns," by Mary Caroline Crawford (Boston: L. C. Page & Co.), and "Old Paths and Legends of the New England Border, Connecticut, Deerfield, Berkshire," by Katharine M. Abbott (G. P. Putnam's Sons). In all ages and countries a vast amount of human interest attaches to inns, centres of genial life that they always are; and probably "mine host" was never more in the foreground than in the early New England to which the first of these books relates. The readers of John Adams's Diary will recall as a charming and natural page the statesman's account of the journey of the Massachusetts delegates to Philadelphia, in 1774. At each stage we know not so well the name of the town as that of the cheerful landlord with whom they lodge. Starting at Coolidge's, in Watertown, they bring up in a few days at Isaac Bears's in New Haven, thence on to Curtiss's, Quintard's, Fitch's, Haviland's, Cook's, and Day's, until they reach Hull's, "The Bunch of Grapes," in New York. John Adams makes it plain the landlords were members of a jovial brotherhood, and this brotherhood it is which Miss Crawford treats with much painstaking, as they stand under their quaint signs, behind them the tavern in which the dinner steams, plentiful entertainment for man and beast. Of the inns described, some have historic associations, like the Wolfe tavern at Newburyport, the Wright tavern at Concord; the "Hancock" and "Green Dragon" in Boston. The "Wayside Inn" at Sudbury takes hold of literature, and many another touches men and events in a way worth remembering. All of which Miss Crawford puts down with good taste and diligence. The purpose of Katharine Abbott's book is not historical, certainly not critical. With a woman's sensitiveness to landscape beauty, she describes the fair hills, meadows, and rivers of western Connecticut and Massachusetts, assigning to the spots she touches the fact or fiction which links it especially with the life of the past. The first consideration with her is not that the legend must be true, but that it must be picturesque. With this no one will quarrel. It is pleasant to have the story of the angel at Hadley, the appearance of the regicide Goffe at the Indian attack, again brought up, though George Sheldon has exploded it. Miss Abbott is anxious to relate, not what actually occurred, but what the country-folk have believed or fancied as occurring; and in pursuing this end she pours out a lavish store of things amusing, pathetic, often in a high degree romantic, the selection showing a good appreciation of what takes hold of the heart of the world. The many photographs make very real the beauty of the localities with which the book is concerned.

The "Life and Correspondence of James McHenry," edited by Bernard Steiner (Cleveland: The Burrows Bros. Co.), promised much because of the man's relations with prominent characters in the Revolution and first years of the republic. James McHenry was trained to be a physician, served in Washington's military family, where he was an industrious and capable secretary, and, attaining some prominence in his State, was chosen a delegate to the Federal Convention of 1787—the privilege of his life, as he expressed it. The editor maintains that "several portions of the Constitution owe their present form to McHenry's efforts," a claim which it would be difficult to establish. In those appointments McHenry was respectable, but showed no special talents. He is chiefly interesting for his circle of correspondents, among whom may be noted Washington, Hamilton, Lafayette, Hugh Williamson, Pickering, Tallmadge, and Vans Murray—the last writing at portentous length on European affairs. Many of the notes from Washington are personal, not historical, and are too trivial to warrant publication. The two compositions from Eleanor Parke Custis are of greater interest, though it may be doubted if she was responsible for the language. There are few of McHenry's own letters, and those few do not prove ability to judge of other men. He was a Federalist, and could see in Gallatin only a political adventurer. Naturally he felt keenly his dismissal by Adams, but it was unnecessary to print so much of his outpourings against the President. The editor is at times indiscreet in his notes, some of which are uncritical and some spiteful. By far the most valuable material in the volume is the letters and drafts of State papers by Alexander Hamilton. They fully bear out the fact of his dominating influence over McHenry while in the cabinets of Washington and Adams, and once more give evidence of his mastery of the foreign relations of the country in their political aspect. This influence, beginning when he and McHenry were Washington's aides, is all the more suggestive, as it was Hamilton who named McHenry for the War Department. He then expressed his opinion that McHenry "would give no strength to the Administration, but would not disgrace the office. His views are good." In less than three years this somewhat colorless endorsement was changed to a charge of insufficiency. This was not due to jealousy, but to a realization that in McHenry's hands the department would make no progress—which was only the truth. The burden thrown upon him by the difficulties with France was too great for him. One-half of this portly volume of 600 closely printed pages is given to his service as War Secretary, and may thus be regarded as a defence of his administration. There is nothing to alter the accepted belief that McHenry was not a large enough man for the emergency, and much to confirm it. To devote so much space to a fruitless and very dry restatement of controversies, important, perhaps, in their day, but no longer of vital interest, is unfortunate. A volume of one-half the size, comprising McHenry's own letters and a selection of those from his correspondents, would have conveyed a better impression of the man. The index is inadequate.

In explanation of certain points of our review last week of "The Reminiscences of Carl Schurz," the McClure Company wishes us to say that there was no intention on their part of leading purchasers to suppose that the work was complete in the two volumes now issued, and that later advertisements made clear that a third volume was to succeed. This will contain the remainder of the autobiography, which comes down to Grant's administration. Mr. Schurz also left a vast amount of material and notes for writing the reminiscences of the latter part of his life, and these have been entrusted to a competent historian, who will continue the narrative from the point where Mr. Schurz left off to the date of his death. The terms of the original contract with Mr. Schurz are responsible for this issuing of the work at different times.

"The Reminiscences of Carl Schurz" are appearing in German, the second volume having been published under the title "Lebenserinnerungen" (Berlin: Georg Reimer). This volume has been translated by the daughter of the author, Miss Agathe Schurz, assisted by Miss Mary Nolte.

In "The Rise and Development of the Gerrymander" (Chicago: Scott, Foresman & Co.) the subject is more interesting than the manner in which it is handled. The author, Elmer C. Griffith, professor of history and political science in William Jewell College, has worked diligently to bring together material, much of it gathered from old newspapers, records of election returns, etc., bearing upon the practice of gerrymandering, from the earliest date down to 1840. He defines a gerrymander as "the formation of election districts on another basis than that of single and homogeneous political units as they existed previous to the apportionment, with boundaries arranged for partisan advantage." Of course, it is a political trick, for the most part turning out to be of real disadvantage to the party that practises it. Professor Griffith rarely philosophizes. He likewise abstains from dealing with the subject as a sociologist. His style is at times obscure. The "dissertation" (for it was submitted for a degree) is a narrative, doubtless accurate, of the several instances in the various States where political parties have perpetrated this species of outrage—and, viewed as a catalogue of misdoings, it is not without value.

"Israel in Europe," by G. F. Abbott (The Macmillan Co.), will be a surprise to the general reader who has a dim idea that the history of the Jews closed with the fall of Jerusalem under Titus. Successive chapters, carefully and authoritatively prepared, prove that Jewish history is continuous, and that with the final destruction of the Temple the Jew's real history began; for voluntary or compulsory migrations, which had already commenced previous to that era, were to scatter his race throughout the globe. This movement, termed the Diaspora, is commonly overlooked in all school and college text books. Yet Mr. Abbott's work shows what fascinating material is furnished by one branch of the subject—the story of the Jews in Europe. Judging from his pages of authorities, general and particular, his book, even if a summary, is sufficiently comprehensive in its way, while he is to be commended for his sober and judicious style. Without glorifying or exaggerating, he aims to be just, and succeeds in his scholarly presentation. Mr. Abbott has been happiest in his recital of facts—generally neglected—which throw light on Jewish conditions in Europe. While he has given less prominence to the Jew's intellectual activity, his social, political, and economic relations receive ample treatment. The story of Israel in Europe, a pariah for eighteen centuries, is a tragedy; and the chapters on Spain, the Ghetto, Catholic Reaction, the Crusades, Anti-Semitism, hardly suggest a civilized era. And as to the future, Mr. Abbott is not hopeful—he believes "there is no rest for Israel." Yet if so much has been overcome, one might be less pessimistic. This note of hopelessness is the only unsatisfactory feature in a work which will do much to popularize the knowledge of Jewish history and lead to a juster and kindlier estimate of the Jew's place in modern civilization.

"Socialism Before the French Revolution," by W. B. Guthrie (The Macmillan Company), is a history of communistic and socialistic theories from the sixteenth century to the close of the eighteenth. The author has grasped the fact that Socialism in every age has been the outgrowth of the existing social conditions; and from this point of view seeks to interpret the writings of More, Campanella, Morelly, and two or three radicals of the period of the French Revolution. He does not profess to deal with all the socialistic works that appeared between the sixteenth century and the eighteenth, since he thinks that "such an attempt would lead in this case, as it has done in so many other cases, to a mere annotated bibliography." The general conclusion to which he comes is that "close generic relationship" exists between the socialistic doctrines of the time with which he deals and Socialism of the present day. This has long been obvious to students of Plato, More, Campanella, and the others; and the researches of André Lichtenberger have thrown much light upon the problem. Mr. Guthrie, however, confines himself so closely to the beaten path that he adds little to our knowledge of the extent and nature of the relationship between earlier and later socialistic theories. Such additions are to be expected chiefly from detailed investigations, like those of Lichtenberger, in fields which have long been neglected even by the Socialists themselves.

Dr. M. A. Tenney's "Social Democracy and Population" (Columbia University Press; the Macmillan Co., agents) is an attempt to answer the question whether it is possible for modern society to realize the democratic ideal—that every man shall have a chance and know that he has it. The author assumes that this ideal, which he terms "social democracy," can exist only where the plane of living is relatively high; and he investigates, from the "sociological" standpoint, the effect of the growth of population upon the "plane of living." His first discovery—"that permanent maintenance of a social democracy requires a rate of population increase less rapid than the rise in the standard of living"—seems to be a somewhat clumsy "sociological" restatement of the Malthusian doctrine. He then proceeds to consider other factors in the problem, such as the ability of one people to defend its standard of living against the competition of another people with a lower standard; the alleged tendency of civilization to encourage the survival of the unfit, *i. e.*, to produce race degeneration; the question whether the level of natural ability can be raised by social control over the growth of population; and the precise things the United States must do in order "to meet the conditions necessary for the attainment and maintenance of social democracy." We gather that he would have our population increase but slowly, would not have us develop a foreign trade based upon exploitation of inferior races, would restrict the immigration of laborers having low standards of living, and would avoid international complications. We infer, too, that he would have us go in for eugenics on a wholesale plan. With its combination of things obvious and things past finding out the monograph well illustrates certain tendencies in sociological writings of the day.

"Industrial Education," by Harlow S. Persons, director of the Tuck School of Administration and Finance, Dartmouth College (Houghton, Mifflin & Co), is one of the prize essays in the series established by Hart, Schaffner & Marx. The volume deals with the training required by young men who would fit themselves for the higher positions in industry or commerce, and the need of providing such training in the United States. The need is now generally admitted, and Mr. Persons has stated the case temperately and forcibly. The outline which he offers for a system of industrial education for the United States is both interesting and instructive. His opinion clearly is that while commercial training should be offered in high schools, collegiate courses, and professional departments, the ideal conditions can be found only in distinctly professional instruction, open solely to those who have already completed a liberal education. The question here raised is a large one, about which, as is well known, there is serious difference of opinion. Mr. Persons, in any case, advances good reasons for the position he maintains, and his book is a useful contribution to an important branch of educational discussion.

W. G. Aston has added an exposition of "Shinto, the Ancient Religion of Japan," to the series of slender books on Religions: Ancient and Modern, published by Archibald Constable & Co. We observe that Dr. Aston, contrary as he admits to the opinion of "nine out of ten educated Japanese," makes nature worship and not ancestor worship the true basis of Shinto. He holds that Lafcadio Hearn's "interesting and valuable work, 'Japan, an Interpretation,' is greatly marred by this misconception."

For purposes of reading the Rev. Alexander V. G. Allen's "Phillips Brooks" in one volume (E. P. Dutton & Co.) is superior to the three volumes of the "Life and Letters" published seven years ago. The abridgment is of sufficient compass to tell the story of the man and his work, and the most valuable and interesting portions of the letters have been retained.

A dozen of the addresses delivered at the beginning of the academical year by Edward Caird, while he was Master of Balliol, are brought together under the title of "Lay Sermons and Addresses" (The Macmillan Co.). They are well worth preserving. Ranging in theme from "The Jubilee of Queen Victoria" to such topics as "Freedom and Truth," "Immortality," "The Faith of Job," they display alike the gifted teacher's power of penetrative analysis and rich spiritual appreciation. Contact with such a mind is in itself an education. "A complete humanity," he says, "cannot be developed either by the spirit that produced the 'De Imitatione Christi' or by the spirit that produced the 'Areopagitica,' but only by both in one." One reading these pages with that sentence in mind will be inclined to fix first upon the gentle submissiveness of à Kempis, and then no less positively upon the rugged independence of Milton, as the dominant temper of the author, and the two elements are indeed so finely blended that it is impossible to determine which prevails. When one turns from these quiet pages of real spiritual power to the loud and strident heresy of the minister of the City Temple ("New Theology Sermons," by R. J. Campbell, The Macmillan Co.), the shock is great. With their endless confusions, their perfervid and narrow zeal for a type of doctrine, their blindness to the most real distinctions, the discourses of Mr. Campbell induce anything but the feeling of religious calm and trustfulness. In the face of such a display the counsel of the British bishop is certainly in order: "Above all things, flee enthusiasm." The plea may be entered for the author that the *rabies theologorum* is not conducive to gentle and edifying discourse, but the fact remains that the volume leaves the reader with the feeling that he has listened for an hour to some old-time teacher of polemic theology, and not at all with the grateful sense of having dwelt for a little in a peaceful house of prayer.

A new "Dictionary of the Bible," to be issued in one volume, under the editorship of the Rev. Dr. James Hastings, the editor of the well-known Dictionary in five volumes, is announced by Charles Scribner's Sons. The work will not be an abridgment of the larger one, as entirely new signed articles by competent scholars are promised. This one-volume Dictionary will be the third work of reference edited by Dr. Hastings.

The new historical introduction of eighty-three pages which Prof. Th. Kolde of the University of Erlangen has furnished for the recently published tenth issue of the Müller edition of the "Symbolische Bücher" (Gütersloh: C. Bertelsmann), gives to this theological classic the value of a new publication. In this introduction the most valuable part is the investigation of the problems connected with the Augsburg Confession. Most important of the results is the proof that neither the present Latin nor German text is the exact reproduction of the original, but that the Latin text has the better claim to correctness This investigation carries still further the conclusion of Prof. Paul Tschackert of Göttingen, made several years ago on the basis of a close comparison of all the manuscripts of the Augustana. He demonstrated that not even the so-called *editio princeps* can lay claim to absolute critical accuracy.

Students of modern religious problems will welcome the second *bedeutend vermehrte* edition of "Die moderne Gemeinschaftsbewegung," by Paul Fleisch, with an introduction by Dr. Behrmann of Hamburg (Leipzig: H. G. Wollmann). The movement, of which this is a critical and very objective investigation, is an agitation directed against the critical neology of the day.

The third annual edition of "Wer Ist's" (the German "Who's Who"), for 1908, edited and published by H. A. L. Degener, in Leipzig, has just appeared. It contains biographies of about 18,000 persons, 2,500 more than in the edition of 1907. The price, ten marks ($2.50), is reasonable for a bound volume, so carefully prepared and well printed, and comprising 1,731 pages. Preceding the body of the work are statistical tables and other useful mater, including biographies of the heads of all nations. The book is imported by Lemcke & Buechner of this city.

The Royal Library in Berlin has published an appeal, requesting that all who have letters of the late Theodor Mommsen send them to the library authorities, to be deposited there either permanently or at least until copies can be made. Mommsen's two sons, Karl and Ernst, have recently given to the library his entire correspondence with the proviso that this collection, containing letters to and from more than fifteen hundred prominent scholars and men of affairs, will be kept under lock and key until the year 1933. This collection contains however, only about one-half of Mommsen's correspondence, and the library authorities hope in response to their appeal to secure the greater portion of the remainder.

A new Swabian author, Wilhelm Schussen, who has the gift of portraying vividly the peasant life of his native Würtemberg, is being warmly welcomed by German literary journals. Two of his recent works are: "Vincenz Faulhaber," a so-called *Schelmenroman*; and "Meine Steinauer," a *Heimathgeschichte*. (Stuttgart and Leipzig: Deutsche Verlagsanstalt.)

To Americans wishing to acquire the rudiments of Danish may be recommended a primer entitled "How to Learn Danish" by Miss Henni Forchhammer (Copenhagen and Chicago: Gyldendal Publishing Co.). The book gives in 91 pages a fair statement of pronunciation, the phrases most needed by a traveller, a brief outline of grammar, and a vocabulary. The preface is by W. G. Collingwood.

One of the chief sensations in this winter's Scandinavian book market is the publication (Copenhagen and Chicago: Gyldendal Publishing Co.) of the long lost manuscript of Ibsen's epic "Brand." This manuscript, which had been left in the lumber-room of the Scandinavian Artists' Society in Rome, has now, after many vicissitudes and forty years of oblivion, come into the possession of the Copenhagen Royal Library and has been edited with copious and instructive notes by Prof. Karl Larsen.

The same publishers have also issued a two-volume edition of Kielland's letters, edited by his sons and prefaced by Prof. Gerhard Gran of Christiania University. Alexander L. Kielland, who died a couple of years ago, as an officer high in the service of the state, had a rather meteoric career as a novelist in the late seventies and the eighties. He proves himself in his letters the same wielder of a forcible pen and the same master of form as in his novels. The collection contains, besides letters to the author's near relatives, epistles to the two brothers Brandes, to Björnson, the publisher Hegel, and many others. Among the most charming letters are those written to the author's Danish friend, Mrs. Viggo Drewsen.

With the volume entitled "Les Bangala," published by the Institut International de Bibliographie, Brussels, the author, Cyril van Overbergh, in conjunction with Dr. Eduard Jonghe, begins a series of works on tribes of the Congo district. The chief purpose is not to furnish entirely new data, but to select and utilize out of the chaos of details found in the vast Congo literature those facts which the scientist, traveller, and merchant most need. The plan is to follow this volume with one on the Monbuttu, or Mangbata, who until recently controlled a territory from South Sudan to the great lakes, and among whom Schweinfurth found old Egyptian traditions. Next will come the scattered warlike tribe of the Asandeh, or Fan, the Majombe, the Ababia, and the Bajandsï. The whole project is largely due to the initiative of the Belgian Société de Sociologie.

François Simiand makes an important contribution to the discussion of one of the most pressing modern problems, in his book "Salaire des ouvriers des mines de charbon," supplemented by answers to criticism before the Société de Statistique de Paris. By reducing fifty years' statistics of wages and results in French coal mines to relative values (percentages on the single year 1892), he translates into graphic tables the comparative variations of average daily production, average cost of labor per ton, selling price per ton, value produced by one day's labor, average day's wage, etc. In his analysis of results and the search after causes, he studies the complicated play of action and reaction on the part of both workmen and employers; variations in the effort of both; changes in the organization of labor, and particularly the development of mechanism. In conclusion, M. Simiand establishes the order of the four tendencies common to workmen and employers, each tendency being stronger than the one immediately following and demanding first satisfaction: tendency to keep to the same gain; not to increase effort; to increase gain; to diminish effort. Examples of the practical utility of such conclusions are given in their application to the settlement of wage rates, to strikes, and to the ratio of profit to wages. M. Simiand's work quite agrees with that of Harzé on coal mining in Belgium; the latter shows that, from 1861 to 1895, the proportional share of the owners with relation to that of the workmen, in value produced, had decreased by 60 per cent.

From the University of Louvain we have the doctor's thesis of a Benedictine monk, Christian Baur, in the form of an essay on "Saint Jean Chrysostome et ses œuvres dans l'histoire littéraire." It is published for the fifteenth centenary (in 1907) of this last of the really great writers in Greek, a Christian Cicero rather than a Demosthenes, having a profound influence on the development of Christian eloquence and appreciated by so leading a modern as Macaulay.

The Ligurian Society of local history is about to celebrate the fiftieth anniversary of its formation. It announces the publication shortly of several important works. "Historical Notes on the Monte di Pietà," by Michele Bruzzone, begins a series of studies on the history of local charities; while two monographs, "The Reminiscences of Francesco Cyho," edited by Luigi Staffetti, and the "Life of Agostino Mascardi," by Francesco Luigi Mannucci, continue the study of local customs which began with Belgrano's "Private Life of the Genovese," and Gian Vincenzo Imperiale's "Travels and Journals," edited by Anton Giulio Barrili. Another member, Paolo Accame, is preparing for the press a continuation of the "Mediæval Inscriptions of Liguria"; and translations are being made of Caro's "Genoa and Its Power on the Mediterranean in the Thirteenth Century," and of Samanek's account of the help given the Ghibellines by Arrigo the Seventh of Luxembourg, whom Dante hailed as the saviour of Italy. The Society has issued recently, "The Finances of the Middle Ages," and the "House of San Giorgio," by Prof. Enrico Sieveking.

When the Dominican Biblical and Archæological School at the Convent of St. Stephen, Jerusalem, was founded fifteen years ago for the purpose of providing training for teachers and writers on Biblical subjects, Pope Leo XIII. expressed his desire that all the lectures should be open to non-Catholic students—an opportunity which has been appreciated. In addition to the lectures there is an archæological walk every week, and two excursions each year, so planned that in two years the whole country is traversed from Petra to Baalbek. The students are accompanied by professors who explain every object and place of interest, while the practical nature of the journeys is shown by the fact that some valuable discoveries have been made in them—for example, numerous Nabatean and Greek inscriptions at Petra. Last year the whole American Institute of Archæology at Jerusalem formed part of the body of students that went through Palestine across the Dead Sea. Among the works in preparation by the school is a large historical geography of the Holy Land, the result of years of research.

The Baltimore Association for the Promotion of the University Education of Women offers a fellowship of $500 for the year 1908-1909 available for study at an American or European university. As a rule, this fellowship is awarded to candidates who have done one or two years of graduate work, preference being given to women from Maryland and the South. Applications must be made before March 20 to the chairman of the committee on award, Dr. Mary Sherwood, The Arundel, Baltimore.

Edmund Clarence Stedman died in this city January 18. He was born in Hartford, Conn., in 1833, and entered Yale at the age of fifteen. At the end of his sophomore year he was suspended for some breach of discipline, and he never returned; but in 1871 he received the honorary degree of master of arts. In 1852 he became editor of the Norwich *Tribune,* and then proprietor of the Winsted *Herald.* But not satisfied with the field of country journalism, he moved to New York in 1856, and soon gained recognition as one of the group of writers which included Bayard Taylor, George William Curtis, William Cullen Bryant, William Winter, and R. H. Stoddard. He contributed to *Vanity Fair, Putnam's Monthly,* and *Harper's Magazine.* Joining the editorial staff of the *Tribune,* he wrote for that paper a number of pieces of popular verse, including "The Diamond Wedding," "The Ballad of Lager Beer," and "How Old John Brown Took Harper's Ferry." These and other poems were printed in his first volume, "Poems; Lyric and Idyllic," 1860. Then Mr. Stedman went to the staff of the *World*; was correspondent of that newspaper at Washington, and at the army headquarters of Gens. McDowell and McClellan; and finally private secretary to Attorney-General Bates in Lincoln's Cabinet. His next step was into the business of banker and broker. He retired from the Stock Exchange in 1900, but until his death he took an active interest in his banking house. Through all this period of more than forty years in Wall Street he kept up literary activity. His published volumes of verse include "Alice of Monmouth, an Idyl of the Late War; and Other Poems," 1864; "The Blameless Prince and Other Poems," 1869; a collective edition of "Poetical Works," including "Pan in Wall Street," "Toujours Amour," and "The Doorstep," 1873; "Hawthorne and Other Poems," 1877; "Lyrics and Idyls, with Other Poems," 1879; "Poems Now First Collected," 1894, and "Mater Coronata," 1900. He was also an industrious and successful editor. In collaboration with Thomas Bailey Aldrich he edited a selection from the writings of Walter Savage Landor; with Miss Ellen M. Hutchinson, "A Library of American Literature," eleven volumes, 1888-90; with George E. Woodberry, Poe's writings in ten volumes, 1895. In this line his most important work was "A Victorian Anthology," 1875; and "An American Anthology," 1900. These substantial volumes are recognized as standards in their field. He wrote for the magazines various critical articles which he gathered into "The Victorian Poets," 1875, followed ten years later by "The Poets of America"; and by "The Nature and Elements of Poetry," 1892. In 1905 he published a "History of the New York Stock Exchange." He was active in many literary and artistic movements, such as the American Copyright League, of which he was vice-president, and after the death of James Russell Lowell, president.

William Livingston Alden, who died in Buffalo January 14, was in his day a popular writer and humorist. Many of his books for boys enjoyed a wide circulation. He was born in Williamstown, Mass., in 1837, and practised law from 1860 to 1865. For the next twenty years he was in journalism in this city, and then he was appointed consul-general to Rome by President Cleveland. Since that time he had lived chiefly abroad. Among his books are "Canoe and Flying Proa," "Domestic Explosives," "Shooting Stars," "Life of Columbus," "Adventures of Jimmy Brown," "Loss of the Swansea," "The Moral Pirates," "Cruise of the Ghost," "Cruise of the Canoe Club," "New Robinson Crusoe," "Trying to Find Europe," "A Lost Soul," "Told by the Colonel," "Among the Freaks," "The Mystery of Elias G. Roebuck," "His Daughter," "Van Wagener's Ways," and "Drewitt's Dream."

James Ryder Randall, author of "Maryland, My Maryland," died in Augusta, Ga., January 14. He was born in Baltimore in 1839, and was teaching in Louisiana when at the outbreak of the civil war he wrote the lines by which he is best known. He enlisted in the Confederate army, but was discharged on account of physical disabilities Since the war he had been engaged in journalism, most of the time in Augusta, Washington, and New Orleans. His verses have never been collected; but among the more popular are: "The Lone Sentry," "There's Life in the Old Land Yet," "The Battle Cry of the South," "Arlington," and "The Cameo Bracelet."

John Ordronaux, lawyer and physician, died January 20 at Glen Head, L. I. He was born in New York in 1830, was graduated from Dartmouth in 1850, and from the Harvard Law School in 1852. While practising law he studied medicine and received a degree in that subject. He was examiner of army recruits in Brooklyn at the time of the civil war, and for many years he lectured on medical jurisprudence in the Columbia Law School. He was the first New York State commissioner in lunacy, and he revised and codified the statutes on lunacy. Among his writings are: "Hints on Health in Armies," "Manual for Military Surgeons on the Examination of Recruits and Discharge of Soldiers," "The Legal Status of the Medical Profession in New York," "Report on Expert Testimony," Hallucination Consistent with Reason," "On Suicide," "The Jurisprudence of Medicine, in Its Relation to the Law of Contracts, Torts, and Evidence," "Moral Insanity," "On Expert Testimony in Judicial Proceedings," "The Proper Legal Status of the Insane," "Legislation in New York Relating to the Insane," "Institutes of Equity as Revealed Through Its Maxims," "Judicial Aspects of Insanity," "The Plea of Insanity as an Answer to an Indictment," "Judicial Problems Relating to the Disposal of Insane Criminals," and "Constitutional Legislation in the United States."

THE AMERICAN NATION.

National Development, 1877-1885. By Edwin Erle Sparks. *National Problems, 1885-1897.* By Davis R. Dewey. [The American Nation, vols. xxiii. and xxiv.] New York: Harper & Brothers. $2 net each.

With these volumes the "American Nation" series enters the field of the newest history. Contemporary history is proverbially hard to write, not only because it is too near to us, but also because there is much about it that we do not yet know. Professor Sparks, for example, has not had the use of the papers of President Hayes, while of such matters as the relations of Blaine and Harrison, the failure of Sherman to secure the Presidency in 1888, and the origin of Cleveland's tariff message of 1887, we still, as Professor Dewey confesses, know too little to offer a definitive explanation. One is prepared, accordingly, in these two volumes for some change of manner. The chronicle of events is reasonably full, and on the whole well-balanced and skilfully arranged, but the narrative is left, as a rule, to tell its own story, with but rare intrusion of the author's personal judgment. Happily for those who will most need such accounts as these, the events of the last twenty-five years in this country could hardly be related, if one tried, with colorless effect; the evils of patronage, the shortcomings of Garfield, the devious policy of Blaine, and the scandalous invasion of Indian rights speak for themselves. At the same time, we cannot but think that the authors of the works before us have rather too much abdicated the historian's judgment seat, and fallen too easily into the position of the intelligent chronicler. One need not write the history of his own time unless he chooses; but if he chooses, the public have a right to expect that he will not systematically withhold his opinion of the permanent significance of the events he deems it worth while to narrate.

Save at this point, there is little but praise for the work here offered. It may well be doubted if even the wisest of the men who have made American history since 1877 have realized how large and varied were the interests which concerned the national life and moulded the national spirit during that brief period. The first five chapters of Professor Sparks's volume are an informing summary of the social and economic change, with its new distribution of population, its epoch-making discoveries and inventions, and its grave problems of industry and transportation, that crowded the decade after 1877. With this as a background, the narrative takes up the Administration of Hayes and the party struggles which the withdrawal of the Federal troops from the South brought on. Of Hayes himself, Professor Sparks gives (pp. 178, 179) a somewhat equivocal judgment. Hayes, he tells us, "coming into office at the dawn of the period of reform, . . . failed to appreciate its meaning, or to respond to its demands." "He represented the old school of gentlemanly statesmanship, when the times were beginning to demand originality and aggressiveness." Yet the material results of his Administration, as shown in the pacification of the South, the resumption of specie payment, the reduction and refunding of the debt, and the industrial prosperity of the country, are pointed to as the "achievements" by which his Administration is to be measured. If we understand these statements, they would seem to indicate that Hayes bridged the gulf of a transition period extremely well, and that his personal qualities were in the main such as fitted him for his own time, and not for some other, rather than that his personal qualities marred fundamentally his success.

Before Hayes's term ended the questions of silver and the civil service had forced themselves into prominence. The story of the early struggle for sound currency and a non-partisan civil service is not pleasant reading, save as one discerns in opposition, intrigue, and failure, the gradual triumph of right; and a perusal of Professor Sparks's chapters at this point may well afford thoughtful Republicans food for reflection. The principal questions of foreign policy in the decade were the Isthmian Canal and Chinese exclusion, the handling of the latter being, we think, a bit tender. The development of the West, on the other hand, is vigorously set forth. The topic least satisfactorily treated is the tariff, the point of view being too exclusively that of Congress and party platforms rather than that of the economic condition of the country as a whole. The volume ends with a sketch of the progress of railway consolidation and the problems arising therefrom, and an account of the Cleveland election of 1884.

The election of Cleveland, the first Democratic President since Buchanan, marks the end of the transition from reconstruction politics. Professor Dewey, who takes up the story at this point, continues the account of the three great economic questions, tariff, silver, and railroads, begun by Professor Sparks, and adds a chapter on the labor movement then rising to national importance. These are but incidents, however, in a struggle whose real issue, as Professor Hart points out in his editorial introduction, was "between the powers of vested interests, of capital and accumulated savings, as against the pressure of producers of farm staples and of the organization of workmen in trades and manufactures." One feels increasingly the press of varied interests, the clash between economic exigency and party expediency, the straining of Constitution and laws in the effort to deal rationally with novel and difficult conditions. Professor Dewey, who is particularly at home in the economic portions of his field, has skilfully indicated the main lines of development. In the stormy administration of Cleveland, especially, he contrives to exhibit with moderation both the strong and the weak points of the President; and it must be admitted that the figure of the great Democratic leader does not become less imposing in his drawing of it.

No one can read with care these skilfully written volumes without being led to some serious reflections on the recent trend of American politics. For one thing, one realizes the overtopping prominence of economic considerations in political life. To-day more than ever, the financial significance of political action tips the scale. Partly as a consequence of this, one notes the disappearance of the school of statesmen whose views, however much to be dissented from, were nevertheless grounded on constitutional principle and adjusted to a broad view of national welfare; and the rise of a school of politicians, who, ignorant of the complicated problems which they are asked to solve, and destitute of the historic sense which alone can make the past shed light upon the future, content themselves with temporary expedients and piecemeal reforms. We still call ourselves a democracy, but we legislate only for classes. Of even soberer significance is the effect of political temporizing upon the Supreme Court, which now for a generation has less and less known its own mind, and to-day guides but unsteadily the course of opinion even among lawyers and judges. Professor Sparks and Professor Dewey scarcely more than suggest these larger aspects of politics, and they wisely refrain from prophecy; but their clear and impartial narratives should perform a needed service in discriminating the numerous and conflicting elements of which American politics has of late come to be compounded.

CURRENT FICTION.

Under the Crust. By Thomas Nelson Page. New York: Charles Scribner's Sons.

It is to be supposed that the title of this collection of stories means "under the social crust," in recognition of the fact that most of the persons presented do not belong to any fashionable set. Certainly Col. Page has never shown more clearly his inability to get beneath the surface of things, never written fiction more dapper, more accommodating, more commonplace. His work has always been popularly successful, it still has the "magazinable" qualities (except humor), if no others. Its properties are those of the generally acceptable sermon or the generally acceptable play. It amiably reflects such views of life as are presentable in the mirage of conventional sentiment. Its individual charm lies in its occasional touches of that highflown eloquence, that ferocious "chivalry," which are even more engaging than disconcerting to the Barbarian of the North. The present "Down-East" tales give little play to that kind of ebullience. Perhaps this is why they will have a moderate interest for readers who recall with pleasure "Marse Chan," and other early plantation stories by Col. Page.

Red-Coat Captain: A Story of That Country. By Alfred Ollivant. New York: The Macmillan Co.

This is a fairy parable for all comers. The classifying mind dockets it at once with "Water Babies," "Alice in Wonderland," and "Peter Pan." We find that children and adults of our acquaintance differ alike as to whether it is moving or silly.

and we frankly own that we are not quite sure of our own opinion. A superficial difficulty for Americans young or old lies in the fact that the terms of the fable are those of English garrison life. Apart from this obstacle of form, there are various questions of interpretation which become rather irritating if the reader allows himself to think of them at all. Is this the adventures of a family or neighborhood of children promoted to the dignity of parable? If the Junior Subaltern is the baby, who is the Commander-in-Chief, and why is he the villain? If the Queen is cook, who is the King? No doubt it is safer not to try to analyze this kind of thing. Much of it is over the heads of children, and some of it is over the head of everybody but the author. The child-idiom of the narrative is delicious.

The Story of Christina. By Mary Harriott Norris. New York: The Neale Publishing Co.

This book is in some respects like its heroine. Christina is described as being "part of the new womanhood in whom intellect and emotion are so completely fused that the ardor of one intensifies the ardor of the other, lifting both to an altitude which fills a woman with the exigency of demand that until the nineteenth century was a masculine prerogative." "Exigency of demand" is quite the keynote of woman and book. The ground plan is not unreasonable, the details careful and often keen but raw. The story is written to show what happens when a beautiful daughter of an American mother and a Swedish father, of Western birth and education, is suddenly whisked from her co-educational college into the ferocious prominence of being a multi-millionairess, a slayer of ten thousand by her beauty and her wealth. The conservative East, the untrammelled West, the lavishness of youth, the avarice of heredity strive within her for possession of her "strong, simple, sincere spirit," each power bringing its own array of scenery, costumes, lovers, and temptations. "In her train were gentlemen, barons, counts, earls, dukes, and princes, most of whom were bankrupt."

"I am not episodical, David," cries Christina, at a late stage of her development. Just what she meant it is hard to say. She was, in fact, little else. In the course of one day in Chicago she is twice made tipsy, she is worked upon by a professional hypnotist, and she is almost married to the villain, escaping only when an opportune alarm of fire supplies a cooling hose and breaks up the wedding. If these be not episodes, what was it to pass hours in a man-hole on the Fourth Avenue railroad in an attempt to escape again from the same villain? And what to be swept from a horse's back into a mill pond and fished out by the hero just as the dam is about to claim her for its own? No, Christina was wrong: episodical she certainly was, and very troublesome the villain made the episodes for her. There was, however, one true soul, a Westerner, whose faith never faltered, who deservedly won the prize.

The story is more successful as photography and topography than as a history of soul development. Christina's soul is rather a mirror for changeful externals than an individual existence. Even the touch of the meaner traits, like avarice, do not avail to make her humanly alive. In fine, she does not quite convince us of her importance.

A King in Rags. By Cleveland Moffett. New York: D. Appleton & Co.

The sociological story is sometimes a great achievement and stirs the world to listen; oftener it is unreadable, and its lessons are lost in air. Mr. Moffett's novel is of neither the one class nor the other. It is assuredly not a commanding exposition of its theme, or in any large way sensational. But while obviously, even naïvely, a vehicle for a moral, the story slips along so easily that it affords no chance to escape the appalling facts it marshals relating to the conditions of labor and living in our city.

The several attitudes held toward the question of poverty by the three leading characters are that:

> Poverty is an ugly beast, . . . created by the greedy and luxurious rich for their own undoing.
>
> Poverty is the lot of the weak and the unworthy, the survival of the unfittest.
>
> Poverty would disappear if there were a fair division of the products of toil.

On these three assumptions the great problem of living is approached, and some interesting experiments made, involving a sojourn in a slum tenement by a railroad king. His way, until his heart has been better taught, is to apply trust methods to trades, to control sanitary conditions so far as shall be pecuniarily profitable, and let who must starve for want of work. The old Socialist, on the contrary, sees no cure for the world's pain but an industrial republic, where a new division of wealth would assign to the people everything that the magnates now hold. He openly charges the captains of industry with keeping back safety devices from their systems, because it is cheaper to kill men than to protect them. A middle ground is held by the young hero, who hails improved tenements and children's playgrounds as the best help to citizenship.

Into the story, which is kept astir with incident, are woven such statistics of vice, crime, and mortality resulting from wrong industrial conditions as must go home to the consciousness of the most callous. From the gilding of our picture frames to the wet-nursing of our babies, there is no employment which should not make stern appeal to every conscience that would not carry a load of blood-guiltiness. If these great problems have been treated more largely, they have not often been presented more sincerely and straightforwardly, nor in more available form.

The Van Rensselaers of Old Manhattan. By Weymer Jay Mills. New York: Frederick A. Stokes Co.

A showy, even virulent, concoction of colored plates, illustrated titles, illuminated initials, page borderings, and large type, enclosed in blue-lavender covers with a beribboned picture of the heroine outside. The whole is in the style of an acute Christmas card many times multiplied. Incidentally there is some text—a romance about sundry real and reputed Van Rensselaers, both Whig and Tory. Into the general flutter of ribbons and rhetoric is introduced Washington with his aide, "Merry Harry Knox," who asks his chief "Art sorry, your excellency, you insisted on turning back?" Madam Van Rensselaer had already questioned him—"Wast thinking where you last saw me?" and we put a fresh laurel leaf on the brow of the Father of his Country listening unperturbed. He did not have to read the book, however, and so was spared much elaborate twaddle.

John Rae, the illustrator, has done some pretty work.

Signora. By Gustav Kobbé. New York: Thomas Y. Crowell & Co.

Though Mr. Kobbé has chosen the form of fiction, he has written not so much a story as a series of miscellaneous sketches. His real subject is the life behind the scenes of a "grand opera" house. It is a life which has undeniable glamour for the ordinary opera-goer, in its mechanical as well as personal aspects. Mr. Kobbé gives a clear idea of the topography of this mysterious realm, and a good deal of amusing gossip about its inhabitants. Under very thin disguises the chief operatic figures of the passing generation appear in citizen's garb—a company of amiable and rather childlike enthusiasts. The nominal heroine of the narrative is a foundling left at the stage door and adopted by the "general utility man." Brought up almost literally upon the stage, she becomes in the end a worthy successor to the great "Caravé" as Carmen. One ought perhaps to be a little "stage-struck" to get the most pleasure out of such a book, but it may be commended for its refreshing quality of ingenuousness to the more cold-blooded reader.

The History of the Squares of London. By E. Beresford Chancellor. Philadelphia: J. B. Lippincott Co. $5 net.

The Ghosts of Piccadilly. By G. S. Street. New York: G. P. Putnam's Sons. $2 net.

Bohemia in London. By Arthur Ransome. New York: Dodd, Mead & Co. $2 net.

The Colour of London. By W. J. Loftie. Philadelphia: George W. Jacobs & Co. $6 net.

The interest of Mr. Chancellor's volume is more for the student or diligent lover of London than for the mere seeker after gossip and anecdote. Taking up the squares of the city in regular order—and there is little of value in London history that in one way or another does not come into their domain—he gives their topographical history and personal associations. The work is the result of great labor, involving research into all parish records and into the archives of many families and land-owners. To those who wish to follow the fortunes of various London houses, with their confusing changes of designation, Mr. Chancellor's work will be indispensable, as, indeed, to all students hereafter of the city. There are numerous illustrations from old prints, giving the historic aspects of the more important squares.

Having made ourselves familiar with the squares in London, we may pass through the Haymarket to Piccadilly, down whose memorable way we shall find in Mr. Street a well-informed and communicative guide.

"The Ghosts of Piccadilly" is not written for antiquarian purposes, although the author does not shirk the necessity of discoursing on the origin of the highway and its quaint name. His interest is frankly with its romantic associations, with the poets and statesmen and great ladies who have lived and written and loved, and, above all, gambled in its famous houses. And what a society: "Old Q.," Beau Brummell (whom Mr. Street treats with proper respect), Mrs. Garrick, Byron (for whom he has always a good word), Macaulay (for whom he confesses a hearty dislike), the Palmerstons, the Duke of Wellington, Emma Hamilton, Scott, Mrs. Coutts—there is no thoroughfare in the English world which so lends itself to piquant and pathetic reminiscences. The *genre* of writing undertaken by Mr. Street is known for its difficulty: on the one side lies the danger of pragmatical dulness, on the other lurks the temptation of strained vivacity. In keeping the middle way between these two extremes, Mr. Street has been unusually successful; he has assumed the right degree of whimsical aloofness to carry off his romantic sensibility, and he has made a thoroughly entertaining book. The portrait illustrations are good; one could wish that views of the houses were added.

From Piccadilly to Soho and the back streets of Chelsea is a step from one world to another; yet, as so often happens, extremes here meet, and the Bohemia of the *beau monde* has its curious affinities with the "Bohemia in London" described by Arthur Ransome. It is not the *poseurs* of the artistic world Mr. Ransome deals with, but the struggling young artists and writers who walk the streets, feeding on bread when they can get it, and on visionary hopes always. We know of no book which portrays the genuine privations and proud independencies of that world better than the volume before us; and his conclusion is sound:

> Bohemia is only a stage in a man's life, except in the case of fools, and a very few others. It is not a profession. A man does not set out saying, "I am going to be a Bohemian"; he trudges along, whispering to himself, "I am going to be a poet, or an artist, or some other kind of great man," and finds Bohemia, like a tavern by the wayside. He may stay there for years, and then suddenly take post-horses along the road; he may stay a little time, and then go back whence he came, to start again in another direction as a civil servant, or a respectable man of business; only a very few settle down in the tavern, forever postponing their departure, until at last they die, old men still laughing, talking, flourishing glasses, and drinking to their future prosperity.

The illustrations, in black and white, by Fred Taylor, are in full harmony with the text.

In his introduction to "The Colour of London," M. H. Spielmann, F.S.A., tells how a young Japanese, with a portfolio under his arm, and looking tired and pale, came to his room and asked him to examine some sketches of London. The young artist was Yoshio Markino, a dreamer in that Bohemia of Chelsea which Mr. Ransome describes, and the outcome of that interview was the present volume, with its abundance of full-page illustrations in color. The pictures exhibit the romantic aspect of the streets and river and parks, with just a touch of Japanese delicacy shown especially, perhaps, in the curved lines of the women's skirts. W. J. Loftie, the well-known antiquarian, furnishes the text for the volume, an agreeable and fully informed chronicle of associations called up by the various streets and buildings.

Science.

NEW LIGHT ON FRANKLIN'S ELECTRICAL EXPERIMENTS.

In his "Autobiography," Franklin states that in 1746 he met a Dr. Spence in Boston, who showed him some electrical experiments, imperfectly performed, but sufficient to awaken an interest in that line of investigation. Returning to Philadelphia he repeated these experiments, became expert in performing them, and added a number of new ones. His house was continually full of people who came to see these wonders, and he found the calls upon his time so exacting that he determined to share the burden. Accordingly, he encouraged an ingenious neighbor, Ebenezer Kinnersley, then out of business, to devote himself to the work. Franklin drew up for him two lectures, "in which the experiments were ranged in such order, and accompanied with such explanations in such method, as that the foregoing should assist in comprehending the following. He procured an elegant apparatus for the purpose, in which all the little machines that I had roughly prepared for myself were nicely formed by instrument-makers." In 1751 Kinnersley went to Boston armed with a letter of introduction from Franklin to James Bowdoin, who dabbled somewhat in science, and the lectures "proved acceptable to the gentlemen of Boston, and were like to be serviceable to himself." Not all of the experiments shown were Franklin's, who was ready to recognize the good work of others. To Kinnersley he ascribed success in applying electricity in ringing of chimes and moving of light-made orreries, and it was Kinnersley who discovered the fact that "electric fire" passes through water. After taking his experiments and apparatus through the capital towns of the colonies, Kinnersley went to the West Indies, in 1753, but his stay there was not long.

So far as I know, no sketch even of these two lectures has been known to exist, and it was with not a little gratification that I found in some papers of William Thornton, so honorably associated with the designing of the Capitol at Washington, a broadside giving the details of the experiments shown. What makes it the more interesting, is the fact that it was issued in St. John's, Antigua, and is dated April 26, 1753. Franklin states that in the West India Islands the experiments were made with difficulty, from the general moisture of the air. And the last words on this broadside are: "Note, the experiments succeed best in fair, dry weather." The lectures were to be continued for a few weeks, and for the entertainment of the curious, the course of experiments on the "newly discovered Electric Fire" containing "not only the most curious of those that have been made and published in Europe, but a considerable Number of new Ones lately made in Philadelphia," would be accompanied with "methodical Lectures on the Nature and Properties of that wonderful Element." Again is met the Franklinian touch in the following sentence:

> It may, perhaps, be quite equal to some Persons which Lecture they begin with; BUT the experiments of the Second Lecture may be much better understood by those who have well attended to the experiments of the First, the One being a proper Introduction to the Other.

This is only an echo of the statement made in the "Autobiography." What has also a personal flavor is the statement:

> As the Knowledge of Nature tends to enlarge the human mind, and give us more Noble, more Grand and Exalted Ideas of the Author of Nature, and if well pursued, seldom fails producing something useful to Man, 'tis hop'd these Lectures may be thought worthy of Regard and Encouragement.

All this for a chequin for each lecture.

There were twenty experiments in the first lecture, and twenty-three in the second. The prevailing theory of the nature of electricity occupied the greater part of the first demonstration, and it is more than a mere curiosity to repeat the general heads, if only to show the simplicity of the method and apparatus:

LECTURE I.

i. Of Electricity in General, giving some Account of the Discovery of it.

ii. That the Electric Fire is a real Element, and different from those heretofore known and named, and *collected* out of other Matter (not created) by the Friction of Glass, &c.

iii. That it is an extremely subtile Fluid.

iv. That it doth not take up any perceptible Time in passing thro' large Portions of Space.

v. That it is intimately mixed with the substance of all the other Fluids and Solids of the Globe we live on.

vi. That our Bodies at all Times contain enough of it to set a House on Fire.

vii. That tho' it will fire inflammable Matters, itself has no sensible Heat.

viii. That it differs from common Matter in this: Its Parts do not mutually attract, but mutually repel each other.

ix. That it is strongly attracted by all other Matter.

x. An artificial Spider, animated by the Electric Fire, so as to act like a live One.

xi. A Shower of Sand, which rises again as fast as it falls.

xii. That common Matter in the Form of Points, attracts this Fire more strongly than in any other Form.

xiii. A Leaf of the most weighty of Metals, suspended in the Air, as is said of *Mahomet's* Tomb.

xiv. An Appearance like Fishes swimming in the Air.

xv. That this Fire will live in Water, a River not being sufficient to quench the smallest Spark of it.

xvi. A Representation of the Sensitive Plant.

xvii. A Representation of the seven Planets, shewing a probable Cause of their keeping their due Distances from each other, and from the Sun in the Center.

xviii. The Salute repulsed by the Ladies Fire; or, Fire darting from a Lady's Lips, so that she may defy any Person to salute her.

xix. Eight musical Bells rung by an electrised Phial of Water.

xx. A Battery of eleven Guns discharged by Fire issuing out of a Person's Finger.

LECTURE II.

i. A Description and Explanation of Mr. *Muschenbrock's* wonderful Bottle.

ii. The amazing Force of the Electric Fire, in passing thro' a Number of Bodies at the same Instant.

iii. An Electric Mine sprung.

iv. Electrised Money, which scarce any Body will take when offer'd to them.

v. A Piece of Money drawn out of a Person's Mouth in spite of his Teeth; yet without touching the Money or the Person.

vi. Spirits kindled by Fire darting from a Lady's eyes (without a Metaphor).

vii. The Electric Fire shewn to be the same with Lightning.

viii. A bright Flash of real Lightning darting from a Cloud in a painted Thunder-Storm.

ix. The Force of a small Quantity of it making a fair Hole thro' a Quire of Paper.

x. Metal melted by it (tho' without any Heat) in less than a Thousandth-Part of a Minute.

xi. Animals killed by it instantaneously.

xii. Air issuing out of a Bladder, set on Fire by a Spark from a Person's Finger, and burning like a Volcano.

xiii. A few Drops of cold Water impregnated with Lightning, and let fall on a Person's Hand, supplying him with Fire sufficient to kindle a burning Flame with one of the Fingers of his other Hand.

xiv. A sulphureous Vapour kindled into Flame by Lightning issuing out of a cold Apple, a Lime, or an Orange.

xv. The Cause and Effects of Lightning explained by a more probable Hypothesis than has hitherto appeared.

xvi. An experiment shewing why Clouds charged with Lightning fly nearer the Earth than other Clouds; and why Emimences are most frequently struck by Lightning.

xvii. Another Flash of Lightning from the painted Thunder-Storm.

xviii. An experiment shewing how Lightning, when it strikes a House or Ship, &c may be conducted to the Earth, or Water, without doing the least Damage.

xix. A Flash of Lightning made to strike a small House, and dart towards a little Lady sitting on a Chair, who will, notwithstanding, be preserved from being hurt, whilst the Image of a Negro standing by, and seeming to be further out of Danger, will be remarkably affected by it.

xx. An Experiment shewing how to preserve Houses, Ships, &c. from being ever *struck* by Lightning.

xxi. The endeavouring to guard against Lightning, shown to be not chargeable with Presumption, nor inconsistent with any of the Principles either of natural or revealed Religion.

xxii. Wheel of a curious Machine turned round by Lightning, and playing Variety of Tunes on eight musical Bells.

xxiii. A Battery of eleven Guns discharged by Lightning, after it has darted thro' ten Foot of Water.

It is only necessary to turn to Franklin's writings on electricity to realize how many of his experiments were given in those lectures. WORTHINGTON C. FORD.

Washington, January 27.

"Les Maladies de l'Énergie," by A. Deschamps, with a preface by Charcot's successor, Professor Raymond, attacks resolutely the disease of the age—neurasthenia. The author's wide and peculiar experience, first in his own case, and then among the poor, especially in the country, where the springs of energy are drained by misery and maternity, sets right many erroneous ideas and frankly opposes the reaction and exercise cure. The disease precisely consists in inability to follow this regimen. The rest cure seems the alternative.

L. Ranvier, professor of general anatomy, publishes a large illustrated volume of the work done during the years 1905 and 1906, in the Laboratoire d'Histologie au Collège de France.

The account given by the American mountaineer, Dr. W. Hunter Workman, of his last exploring expedition in the Himalayas to the Royal Geographical Society forms the principal feature of the *Geographical Journal* for January. He was accompanied by his wife, whose ascent of a peak 23,300 feet high is ranked as one of the most wonderful mountaineering exploits on record. The special object was the study of the glaciers, one of which ended, like a polar glacier extending to tide-water, in a perpendicular ice-precipice about 600 feet long and 200 feet high. A remarkable experience at great altitudes was the enormous difference between the day and night temperatures.

The second international congress for the study of sleeping sickness, which was first called for last November, is to be held in London in February. The German government asked for this postponement in order that the results of Professor Koch's researches during his recent tour in Africa might be presented by Koch himself.

The death of Morris Ketchum Jesup in this city January 22 removes a generous patron of education, and especially of the sciences. He was born in Westport, Conn., in 1830, and entered business at an early age. During most of his life he was a banker in this city. He made large gifts to Princeton, to the Union Theological Seminary, to the Young Men's Christian Association, and to other educational and philanthropic enterprises. His chief interest, however, was the American Museum of Natural History, of which he was president at the time of his death. Through his help the Museum now possesses the most valuable collection extant of specimens of American woods, and a fine collection of the minerals of this continent. He was president of the Museum's East Asiatic Committee, under whose auspices Dr. Berthold Laufer went to China and made collections, the beginning of a department in which all the different cultures of Eastern Asia shall be represented. Mr. Jesup in 1897 gave the Jesup North Pacific exploration fund. Under this, MM. Bogoras and Jochelson went to the Amur region, Siberia, to study the tribes there. In May, 1905, following a gift from Mr. Jesup to the St. Petersburg Academy of Sciences, the Czar appointed him a Knight of St. Stanislaus of the first degree, in recognition of his services to the cause of ethnological research. Explorations in British Columbia were completed in 1903, and were later extended to the State of Washington. Ultimately, through the Jesup endowment, scientists hope to discover the course of racial migration in the New World and the relationship between the earliest known inhabitants of Northwest America and the aborigines of the Asian continent and Japan. Mr. Jesup also assisted Peary on different occasions, to the extent of some $200,000, in the attempts to reach the North Pole.

Alfonso Sella, professor of physics in the University of Rome, has recently died at the age of forty-two. After graduating at Turin, he studied at Göttingen under Riecke and Voigt, and for ten years was Prof. Pietro Blaserna's assistant in the Institute of Physics at Rome. He was appointed professor extraordinary at the University of Rome in 1899, and was promoted soon after to an ordinary professorship. He was a member of various learned societies, was secretary of the Italian Society of Physicists, and was secretary and one of the founders of the Italian Society for the Advancement of Science, whose successful organization last September was largely due to his initiative and to his executive ability. He was also well known as an Alpine climber. Among his publications were: "Investigations of the Physics of Crystals," "Influence of the Röntgen Rays and of Ultra-Violet Light upon Sparks," and "Investigations of the Radioactivity of the Air."

The Rev. Lorimer Fison died December 29 near Melbourne, Victoria. He was born in England in 1832 and educated at Cambridge. After several years of gold digging in Australia, he joined the Wesleyan mission to Fiji. There he began his career as an anthropologist; and he later extended his labors through Australia. His research established the fact of a system of group marriage among the aborigines, according to the conclusions set forth in L. H. Morgan's "Ancient Society." Among his publications are "Kamibaroi and Kurnai," "Group Marriage and Marriage by Elopement" (with A. W. Howitt), "Land Tenure in Fiji," "Tales from Old Fiji," and papers on anthropological questions published by the Anthropological Institute and the Smithsonian Institution.

Prof. Albert Hoffa of the University of Berlin, and well-known for his various works on orthopædy, has just died at the age of forty-seven. He was author of "Lehrbuch der orthopädischen Chirurgie," and "Frakturen und Luxationen."

Drama.

TWO NEW PLAYS.

Poetic works are so infrequent upon the contemporary stage that a piece like "The Jesters," now to be seen at the Empire Theatre, is entitled to a word of hearty appreciation, even if it does not fulfil all pleasurable expectations. It must be admitted that the original work of Miguel Zamacois has suffered at the hands of the adapter, John Raphael, who, by his unfortunate choice of metre and imperfect sense of musical diction, has robbed the verse of much of its fluency and simple grace, and taken the bloom, in many places, from a sentimental, romantic, and humorous fantasy by a touch of prosaic realism. But, even as it stands, the little play, for those who have ears to hear and sympathetic, discerning vision, has distinctive literary and imaginative qualities of an agreeable if not very dazzling order. The story, one of the innumerable variations of the oldest of fairy tales, is naught in itself. A dainty maiden, cloistered by a doting but penniless old sire in a ruinous castle, prompted by mysterious yearnings of which she knows nothing, longs for a mate, the fairy prince of nursery fable. He comes in the shape of a hunchbacked jester, who wooes her with the magic of his mind and tongue. At first she is inclined to favor a rival, duller of speech, but straighter of form, but presently, by a pretty conceit, the crooked lover teaches her the danger of judging the inner by the outer man, and wins from her a confession of love. Then, of course, he discards the false hump, shows himself as valiant and beautiful as he is wise, and carries her off to his own lordly castle. There are other personages—the proud but poor old father baron, the rival lover, a swaggering, drunken retainer of the ancient

Pistol kind, a harassed steward, servants, and so forth—and all of these are individualized with keen strokes of characterization and a vein of genuine if not very original humor, but practically there is no dramatic interest save in the progress of the hunchback's suit. The tale charms by its sweetness, simplicity, and humanity—a humanity that is none the less real because it is enveloped in the fanciful atmosphere of romance. To judge such a delicate trifle by the rigid standards of actuality would be ridiculous. The appeal is directed to the heart and the imagination, not at all to cynical common sense. For adequate stage interpretation it demands a degree of histrionic accomplishment far beyond the attainment of any of our present theatrical companies. The slovenly speech, ineloquent, spiritless, and graceless action of our modern players strip it of nearly all the illusion which is the life of an imaginative creation. In Paris Sarah Bernhardt played the part of the disguised lover, and it is not difficult to imagine with what pictorial and oratorical perfections she endowed him. At the Empire the hero is dependent solely upon the personal fascination of Miss Maude Adams, a rich possession, indeed, but in this instance inadequate. The only thoroughly competent performance, except for his broken speech, is the bully of Gustav von Seyffertitz, who ought hereafter to prove a great acquisition to the English stage. But in spite of all "The Jesters" is a delightful entertainment.

To what extent is a wife bound by her matrimonial vows to her husband? This is the theme of "Irene Wycherley," Anthony P. Wharton's play, which has been received with critical acclaim in London and was produced in the Astor Theatre here on Monday evening. It is a piece full of youthful extravagancies and inconsistencies, but is nevertheless a remarkable work for a beginner, being uncommonly well made and deriving its action from the impelling force of character and circumstance. Its chief fault lies in the unnecessary crudity of some of its details, a fault common to youth, which is too apt to regard artistic reticence, in speech or action, as a sign of weakness. Mr. Wharton leaves little to the imagination, and the effect of his argument, as well as the general quality of the play, is lowered by his insistence upon unsavory, if veracious, details. Thus the principal scene, which has been widely praised for its truth and insight, in which the blinded and disfigured husband revolts his wife and brings about the final catastrophe by an exhibition of gross animalism, is, as a matter of fact, as unreasonable in the prescribed conditions as it is offensive to good taste. There can be no question that he has demonstrated a case in which the husband has made the matrimonial yoke an intolerable burthen; but he has failed to show the necessity of his wife's submission to it. Nor has he suggested any way out of her dilemma, except by the rupture of bonds imposed upon her only by her own conscience. To this extent the play is futile as well as unpleasant. Moreover, it must be admitted that the murder and suicide, through which the distressed wife ultimately secures her freedom and the promise of a new happiness, are less probable than they are convenient, although much ingenuity is displayed in leading the action up to them. But, in spite of these shortcomings, the clever construction, excellent dialogue, lively and varied characterization, and cumulative interest, are merits that greatly outweigh the faults. The general performance is very good, but Miss Viola Allen is too self conscious and artificial an actress to give full effect to the character of Irene, while Mr. Arden, by an over-brutal impersonation of Wycherley, makes it difficult to sympathize with any woman who could ever have debased herself by marrying him.

It is pretty plain from the London criticisms, and, indeed, it is no more than might have been expected—that the "Edwin Drood" which Comyns Carr has constructed and Beerbohm Tree has produced at His Majesty's Theatre will give little satisfaction to the lovers of Dickens. These will not put much faith in the solution of the story's problem as worked out by Mr. Carr, or find much in the stage puppets to remind them of the original characters in the book.

Duffield & Co. will publish this season: "A Scheme and Estimate for a National Theatre," by William Archer and Granville Barker; The Stratford Town Shakespeare in ten volumes; Brooke's poem of "Romeus and Juliet" in the Shakespeare Library Series, and four volumes of the Shakespeare Classics: "The Troublesome Reign of King John," "The History of Hamlet," "The Play of King Leir and His Three Daughters," and "The Taming of a Shrew."

Music.

The History of Music to the Death of Schubert. By John K. Paine. Boston: Ginn & Co. $2.75 net.

The History of Music. By Waldo Selden Pratt. New York: G. Schirmer.

To the late Prof. John K. Paine belongs the honor of having introduced music as a regular course in Harvard University, a good example which other universities have since followed. One of his subjects, from the beginning, was the history of music. For fully three decades he lectured on that to classes numbering at first only half a dozen hearers, but gradually growing larger and larger. It was his intention to end his career by editing his lectures and issuing them in book form; but his sudden death prevented him from completing that plan. He had had the lectures covering the time to the death of Schubert typewritten, and had begun the revision of this material for the printer. After his death Mrs. Paine asked Prof. Albert A. Howard to see the book through the press. Professor Howard is an expert on ancient musical instruments, who is cited by Paine (p. 18); he has done his editorial work conscientiously, and has supplied helpful marginal notes. As the remainder of Paine's work existed only in the form of manuscript notes, and had not received the same careful treatment as the earlier portions, the editor wisely decided to end the book with Schubert, and to fit the title to the abbreviated form.

For more reasons than one it was perhaps just as well that this was done. Paine was a conservative; he had little sympathy with Liszt, Berlioz, and the later developments of the romantic school, and his treatment of them would perhaps have lacked the objective, judicial attitude which now distinguishes his book, as well as the charm of sympathetic appreciation which attaches to his comments on the older masters. Wagner, too, used to be on his black list, but concerning him he changed his mind, and while he incidentally expresses his conviction that even Wagner's orchestral preludes are not so great in tragic pathos as some of the works of Beethoven, he ranks him with his idol in the ability to make his various works wholly unlike each other in style and treatment. In saying of Beethoven that "his bold modulations were unprecedented," he forgot Bach for the moment, though a worshipper of that composer. In pointing out that Beethoven was not preëminent as a vocal composer, he refers to the curious fact that while Beethoven often consulted orchestral musicians with regard to instrumental technical effects, he apparently did not ask the advice of singers as to vocal treatment. Schubert is ranked by Paine as supreme in song, and second in the symphony only to Beethoven. Oddly enough, he makes no adequate reference to Schubert's pianoforte pieces, which Rubinstein and Dvorák placed even above his songs in charm and originality.

The chief value of Paine's history lies in the remarkable clearness of all his statements. Frequent iteration of the same points to constantly changing classes finally gave him the faculty of getting at the kernels of the hardest nuts with ease; subjects like ancient Greek music, the development of a musical notation, the first steps in the evolution of polyphony and harmony, which in some treatises are shrouded in impenetrable mystery, are here shown with stereoscopic distinctness. The account of Palestrina and his services to church music corresponds with the latest researches.

Professor Pratt's aim in writing a history of music was quite different from Professor Paine's. Though he, too, lectures on this subject (at Smith College and elsewhere) his object was not to produce a book for use in the class room, but rather a work of practically encyclopædic fulness. He has packed an immense number of facts into his 683 pages, and he must be commended specially for his skill in grouping the material in such a way as to give a proper perspective of the enormous field in view by his way of grouping the facts, the more important in larger type. It may be said that too many minor names are included among the numerous sketches of composers. By omitting such trivial information, room might have been provided for references to the more important books in which the subject of each chapter can be studied in detail. Apart from this, it would be difficult to suggest a way in which this book might have been improved. The summaries of each century are particularly serviceable, and the great composers are happily characterized in brief space. To the history of musical instruments more space is given than usual in books of this kind, and this feature will be welcomed, as information on this branch is widely scattered and not always easy of access. Beside the numerous illustrations of instruments and portraits of composers there are several maps of Europe in different ages. To sum up, Professor Pratt's history is a marvel of industrious research and exceptional usefulness.

Few things in the annals of opera are comparable to the apparition and triumph of Luisa Tetrazzini. Her career began eleven years ago, and she soon became a great favorite in St. Petersburg and in the cities of South America. Once she appeared in San Francisco and aroused so much enthusiasm that Mr. Conried engaged her for the Metropolitan Opera House; but she never appeared there, and nothing more was heard about her until, last November, she sang in London to an audience which only half filled the theatre. The next time she sang, the house was crowded to the ceiling, and so it was at all her subsequent appearances. The press joined the public in acclaiming her as a new Patti, and Mr. Hammerstein, who was sadly in need of a prima donna, engaged her promptly for the Manhattan Opera House. She has now appeared here three times, as Violetta in "La Traviata" and as Lucia in Donizetti's opera, and so far as the public is concerned, her triumph has been even greater here than in London. A stronger searchlight has, however, been thrown here on her vocal art, and the assertion that she is a second Patti must be denied. Her voice is not, like Patti's, of equal beauty in all its registers, nor are the registers equalized. The critical listener is disturbed by ugly gulps and an occasional false attack of a high note. Her trill is not so even as Melba's, or her cantilena so beautiful and expressive as Sembrich's. There is little dramatic feeling in her singing; and yet she thrills audiences that like ornate song as few of her predecessors have thrilled them. The chief beauty of her voice lies in the top register; her high C, D, and E flat are of dazzling brilliancy, and the ease with which she flings out the most dizzy *staccati* and the intricacies of florid song is astounding. There are many thousands who greatly prefer this ornate style of song to the more dramatic styles exemplified in "Aïda," "Carmen," and "Madama Butterfly," not to speak of "Tristan"; and for such as these Tetrazzini is a blessing.

Cincinnati is to hold its eighteenth biennial Music Festival May 5 to 9. The principal choral works to be given are: Bach, "St. Matthew Passion"; Grieg, "Olaf Trygvasson"; Haydn, "The Seasons"; Pierno, "The Children's Crusade"; Beethoven, Ninth Symphony. The soloists thus far engaged are Johanna Gadski, Corinne Rider-Kelsey, Schumann-Heink, Janet Spencer, Daniel Beddoe, Edward Johnson, Dalton Baker. The festival forces consist of a chorus of 500; children's chorus from the public schools of Cincinnati, numbering 700; the Theodore Thomas Orchestra of 100. Frank Van der Stucken is conductor; and the associate conductor is Frederick Stock.

A year ago Humperdinck wrote a dozen pieces of incidental music for Shakespeare's "Winter's Tale," and now an opera has been written with that play as a libretto, by Carl Goldmark, whose "Queen of Sheba" was at one time one of the most popular operas on the stage. He is now seventy-six years old.

Art.

THE PENNSYLVANIA ACADEMY EXHIBITION.

The one hundred and third annual exhibition of the Pennsylvania Academy of the Fine Arts is, as is usual with exhibitions of that institution, an interesting one. It is also, more nearly than is always the case, an exhibition of current work; for there are comparatively few borrowed pictures of earlier date than the last few years, and no special exhibits of the work of one painter, living or dead. The galleries are too high, and not too well lighted, and some of them still retain the cruel red wall covering which once pervaded them all, but the general aspect of the show is a striking example of the advantage of sufficient space, not so much for the placing of many works as for the proper installation of those selected. There are four hundred and fifty-nine pictures here, only a few more than were shown in the last National Academy exhibition in New York, but the impression is of a much greater number. Each picture has some space about it, and the spreading of the exhibition through a number of smallish rooms has enabled the Hanging Committee to group the paintings sympathetically and to avoid the clash of opposing methods and discordant tones. Each picture looks its best, and this or that old friend reveals new beauties in its present surroundings.

There are many of these old friends. More than forty pictures were at once recognized as having figured in the National Academy exhibitions of the last year or two, and there are probably many more which have so figured, but were not remembered. When one notes that among these are such things as W. Sargeant Kendall's two portraits and his Reflection, Ben Foster's In the Pines, Elliott Daingerfield's dramatic Mountain Showers, J. W. Alexander's Portrait of Mr. Whittredge and A Favorite Corner, Louis Loeb's The Summit and Twilight—Calm Refuge of Day, E. W. Redfield's March, W. T. Smedley's Booklovers, Emil Carlsen's Canaan Mountain, Leonard Ochtman's December, Hugo Ballin's The Bath, Irving R. Wiles's Portrait in Black, Henry O. Walker's Portrait of Brother and Sister, and Paul Dougherty's Surf Ring and Twisted Ledge, to mention but a few, one realizes how much that is important here comes from our own exhibitions. One must add to these the pictures by E. C. Tarbell, T. W. Deming, W. M. Chase, Willard L. Metcalf, J. Alden Weir, and the late John H. Twachtman, which have been seen at the exhibitions of the Ten American Painters or at "one man shows" in New York, and such borrowed works as Winslow Homer's Search Light (from the Metropolitan Museum), J. Frank Currier's Whistling Boy, John S. Sargent's Lady With a Rose, and George DeForest Brush's early Moose Hunt, all familiar to well-informed New Yorkers.

That these pictures should be in the exhibition is altogether to its advantage, and to the credit of the managers, but their presence makes the task of the critic difficult. If he would not repeat comments already, and very recently, made, he must restrict himself to the merest mention of many of the things which are best and most important. The Sargent is, indeed, so old a friend that it is almost new. The quarter century since it was painted has slightly and pleasantly gilded its surface, and added the last charm to its always perfect workmanship and delicate refinement. Mr. Sargent has done more vigorous and more brilliant things since 1882, but never anything lovelier, and it is good to see again this expression of a mood that is not common with him. The richness and quality of the blacks are especially delightful, and one cannot avoid the wish that he would oftener paint them in this way; but the great charm, after all, is that of a winning personality treated with entire sympathy. The John Sargent that we have is a great figure in contemporary art. It is well to be reminded that there was another Sargent, finer in some ways if less forceful.

Directly opposite this great picture hangs one of the most important of the new works shown, E. C. Tarbell's almost entirely admirable portrait of President Seelye of Smith College. It is a large canvas, nearly square, and represents the scholar, in academic gown, seated at a table with books and a lamp upon it. The head is sympathetically characterized and admirably painted; the gown is well arranged and is unmistakably black, while receiving as much light as the head; and the background shows the feeling for gradation and illumination which made the Girl Crochetting one of the most remarkable genre paintings of our day. It is a picture as well as a portrait, and should add to the painter's great and deserved reputation. The only fault in it is the rendering of the right hand, somewhat self-conscious in pose, sharp of edge, and, to my feeling, false in value. It catches the eye and holds it with a certain insistency, disorganizing somewhat the adjustment of the tones which would otherwise be perfect.

Near these two pictures hang the new contributions of Paul Dougherty and Sergeant Kendall. Mr. Kendall's Narcissa is a variant on his Reflection—the same model in the same surroundings, but differently posed. It is even more interesting in line than the other, and the bit of bright green ribbon gives its color an odd tang that pleases. Mr. Dougherty's Blue Gale is of the same sturdy, full-blooded kind as his previously seen contributions. It is of fine, full color, and the hump of the wave over the rocks—it is moving too fast to break against them—is well caught. Near by is a marine of another quality, Charles H. Woodbury's Deep Sea. It is a small canvas, but, as in his larger At Sea, in another room, there is a great lift to the wave, and great sense of bulk and massiveness, attained with little actual height and by sheer force of drawing. Good and interesting drawing of another kind—drawing occupying itself with the intricate loops of foam formed by the surf—is shown in Frederick J. Waugh's three contributions. In the largest of these, Under the Full Moon, there is also a good study of moonlight on the creamy water. A different condition of moon on sea, when the dancing glitter of reflection is the principal thing aimed at, is shown in F. W. Benson's Moonlit Sea. There is little wave drawing here, but the glitter is attained.

Three large figure canvases are Cecilia Beaux's Brother and Sister, which, where it is hung, looks less interesting than her work usually does—it may be the fault of the lighting that the eyes seem unduly dwelt upon; Eugene Paul Ullman's Child at Play, with its clever handling which reminds one of that of Alfred Stevens; and Homer Boss's Portrait of an Actress. The latter is, as to manner, of the ivory black school of the moment, but shows a feeling for character, which is of no school. W. W. Gilchrist, jr., paints charmingly in his small picture called In the Little Gold Room, and Philip L. Hale, in his Glitter, experiments with some success in the vein of Howard Cushing. There is so much knowledge and ability in Mr. Hale's work that one wishes he might find himself and cease echoing others.

In Gallery G one notes Frederick Clay Bartlett's soundly designed and painted Roman Afternoon; Edward W. Redfield's Fallen Tree, vigorous and fresh in its blue and white and gold, and Alfred H. Maurer's black and white Parisienne, which shows the artist in a transitional state and less sure of himself than he was some years ago. Perhaps I may, without impropriety, mention Mrs. Louise Cox's two contributions before passing on to Gallery H, filled, mainly, with the work of the more impressionistic among the "Ten American Painters" or with pictures in harmony with theirs. Of the pictures here, not previously seen by the present writer, Mr. Benson's Portrait of my Three Daughters, awarded the Temple gold medal, is perhaps the best. The pervading sunlight is admirably rendered, and the tones of warm rose and violet and blue make up a fine harmony of color. Robert Reid's White Lilac is exceedingly pale, but full of a delicate charm, and Willard L. Metcalf's Trembling Leaves succeeds in conveying the dazzle of young foliage shaken by a light breeze. Childe Hassam always has fresh work to show, and he has two good pictures in this room, but even better is his Leda in Gallery I, a beautiful piece of out-of-door painting, with admirably designed tree masses, in which the white of the swan plays its part to perfection. His Aphrodite, from the Pittsburgh exhibition of last year, completes his representation. William M. Chase is never so much himself—never so much the painter—as when he is occupied with still-life, and his study of Fish, in Gallery A, is of his best, powerful in color and direct in handling, if less flowing and unctuous than some of its predecessors.

With such new works as these and such works already seen as those before mentioned, and with much more, new and old, of a high degree of merit, is furnished forth an exhibition which cannot fail to justify further one's admiration of the present achievement and confidence in the future excellence of the American school of painting. Our sculpture is not so well shown, although there are a hundred and thirty-nine pieces on exhibition—a number far in excess of what our narrow gallery accommodation admits of in New York. The truth is that this number has been attained by a doubtfully judicious liberality of admission, much of the work seen being below any conceivable standard of merit. Outside a few things from recent New York exhibitions, such as Karl Bitter's Testimonial Tablet and Edith Woodman Burroughs's charming Circe, and outside a large collection of the animal bronzes of the late Edward Kemys, the sculpture shown is mostly of local origin, and as there are some first-rate sculptors in Philadelphia there are some good things, such as Charles Grafly's well-modelled Maidenhood, A. Stirling Calder's graceful and elegant Pacific Venus, and Albert Laessle's capital studies of tortoises; but of many other pieces it may be said, as it cannot be said of many paintings, that the exhibition would be the better for their absence. KENYON COX.

To the Italian art magazines a new *Vita d'Arte*, published in Siena, is now added. Among the articles contained in the first issue (January) may be mentioned "Le Meduse degli Uffizi," by Corrado Ricci; "Un' Altra Figlia del Mare," by Angelo Conti, and "Alberto Martini," by Giovanni Papini. The illustrations are well printed, but it is only right to add that one or two of the subjects reproduced from Martini's work are revoltingly unwholesome.

Charles Scribner's Sons have now on their list of imported books the second volume of "In English Homes" with its many handsome photographs by Charles Latham and its letterpress edited, and in part written, by H. Avray Tipping. What was said in the *Nation* (October 13, 1904) about the first volume of these papers collected from the London *Country Life*, stands equally well, with the change of names, for the second. There is the same series of handsome photographs, the same lack of plans whether of the interiors or of grounds, and the same sketchy text. In the present work forty-nine places are pictured and described, including such old historic homes as Hever Castle, Holland House, Welbeck Abbey, and more modern structures, such as Clouds, in southwest Wilts, built by the Hon. Percy Wyndham. A volume of the same character, but much smaller in scope and cheaper, is "The Fourth Book of Pilgrimages to Old Homes," by Fletcher Moss, with photographs by James Watts (published by the author, Didsbury, England). The heart of this fourth tour takes us to Wales, where romantic associations and ruins are more abundant than ancient castles that are still homes. But there is Gwydyr Castle, of the Wynne family, with its furniture, panelling and relics well preserved from restoring and modernizing. A chapter still more interesting than this takes us into Derbyshire, to old "Bess of Hardwick's" glaring mansion, Hardwick Hall. Mr. Moss tells the matrimonial adventures of that famous lady with considerable vivacity.

The latest volume of the series Les Maîtres de l'Art is devoted to Scopas and Praxiteles, but really includes all Greek sculpture from the fourth century B. C. to the time of Alexander. It is written by Prof. Maxime Collignon, whose abundant historical work in this field is too well known to need recalling.

Marcel Dieulafoy, who with his wife began the excavations on a great scale at Susa and published the wonderful reproductions of the Esther and Ahasuerus palace, consecrated by a hall in the Louvre museum, has turned his attention to a more recent field. In "La Statuaire polychrome en Espagne" he describes the almost unknown work of artists whom he calls "pupils of Michael Angelo and contemporaries of Velazquez." The volume (price 100 francs) has 80 fine plates, of which 3 are in colors.

Two reproductions of antique mural paintings in colors are published by E. A. Seemann, as the twenty-fourth *Heft* of his large collection, Die Galerien Europas. These pictures, now in the Thermal Museum of Rome, were originally in a Roman house dating from the early days of the empire.

The frescoes by Domenico Ghirlandaio in the choir of S. Maria Novella, Florence, are once more exhibited after more than two years of concealment behind scaffolding. Most of this time was wasted in inconclusive debate about the proper method of cleaning. At length, about two months ago, the matter was placed in the hands of a committee consisting of Bernhard Berenson, Signor Marrai, and Professor Volpi. It was decided that only a careful cleaning with bread crumbs was necessary to remove the dust and grime, and the work proceeded rapidly in the skilful hands of the restorer, Domenico Fiscali. Now one sees the series not as Ghirlandaio left it, for the cleaner has cautiously refrained from removing the last vestiges of dirt, but, at least, better than it has been seen in the memory of men. On the whole, the result is an exposure of Ghirlandaio's weakness as a decorator. The work abounds in superficial and fetching prettinesses, but except in the portrait groups one lacks the serious note of the Florentine Renaissance. These designs appear as a perfunctory and weary product of his old age, and one suspects that not merely in execution but in invention student assistants played a prominent part.

In many ways Italy is now showing her sense of responsibility in the matter of protecting both her ancient monuments and the beauty of her landscape. The Commissione Centrale per le antichità e belle arti has passed several important resolutions at recent meetings for the preservation of old buildings. The project of destroying the Porta al Borgo in Pistoia and the historic city ramparts of Lucca for the passing of electric trams, has been strictly forbidden. The project of changing the old picturesque arch of the Buontalenti in Florence, which joins Or San Michele with the Palazzo dell' arte della Lana, has also been stopped. It is due to the energy of the same society that the erection of a modern villa close to the famous Oratorio di San Bernardino in Perugia was prohibited. The government and the city of Perugia will purchase the land close to the Oratorio so as to prevent any repetition of such an attempt. The archæological section of the Commissione Centrale has, moreover, passed a resolution which will meet with general approval. There has been much talk of cutting down all the trees in the gardens of the Villa Mills and the monastery of San Bonaventura on the Palatine. One of the most picturesque spots in Rome would thus be spoiled. It has now been decided to preserve them and carry on excavations on that site only in so far as no damage is done to them. The present Municipal Council of Rome has been severely criticised, both in Italy and elsewhere, for opening several breaches in the walls of the Capital. It appears, however, from an official statement which has just been issued, that the new council is by no means to blame. It has done nothing but continue what has been proposed and ratified by scientific bodies and carried out by the previous administration. The openings were made in the stretch of wall between the Porta Pinciana and Porta Salaria, which contains portions in a very reduced condition, or with considerable modern restorations. Thus new and direct communications between the adjacent quarters could be established without sensible damage to the Pincian walls.

The Alhambra at Granada is being cleared, as far as possible, of all modern restorations which now obstruct various parts of the monument. The original design of the building will then come out to greater advantage.

At the Pratt Institute, Brooklyn, there is an exhibition of aquarelles, illustrative of the life of Jeanne d'Arc, by Maurice Boutet de Monvel, till February 13. Among the exhibitions at the dealers' galleries are paintings by Henry Moret, Durand-Ruel's, January 25; pastels and water-colors by Alexander Robinson, Powell's, January 31; pictures by Paul Dougherty, William Macbeth's, February 1; paintings by Henry R. Poore, Theodore C. Noé's, February 6.

Eugène Vidal, painter of portraits and landscapes, member of the Société Nationale des Beaux-Arts, has died at Cagnes. One of his works is now on the wall of the Luxembourg.

Finance.

CLEARING-HOUSE CERTIFICATES.

It was said at the New York Clearing House, on Monday, that the loan certificates, issued to New York banks for use in exchanges during the money-hoarding panic, have been redeemed and cancelled with such rapidity that their complete retirement is plainly in sight. This result, it hardly need be said, followed naturally on the $26,000 000 gain in cash reserves by the city's banks last week, of which $10,000 000 to $15,000,000 apparently represented return of hoarded cash. After the decision of the New York Clearing House, on October 26, to resort to loan certificates, no information as to the amount allotted to the banks was given out. The public was left in the dark until a few days ago, when the president of the Clearing House declared that, at the crisis of the panic, $97,000,000 of this substitute money had been issued.

In this matter of Clearing-House certificates several considerations are worth examining. That the maximum issue of $97,000,000 far surpassed all precedent—the $38,000,000 in 1893 holding the previous record—is not of itself more remarkable than the fact that the deficit of New York bank reserves, below the 25 per cent. ratio to deposits required by law, should have reached $54,000,000 last November, as against the high record of $16,500,000 in 1893. We are dealing nowadays with much larger totals, and despite the seemingly enormous shortage of reserve in November, the cash still left was 20 per cent. of outstanding deposits, or practically the same as at the crisis of 1893.

The larger question is, what this experience of 1907 foreshadows for the future. By general consent, recourse to loan certificates, adopted with great reluctance last October, sustained the solvency of the banks at a critical moment. But this does not prove the expedient a good thing *per se*. People are asking whether the certificates did not bring serious evils in their train.

In theory, the use of such paper, secured by appropriate collateral, in payment of daily Clearing House balances against a bank, means that the stronger banks lend their cash reserves to a weaker associate. They are creditors; by the ordinary rule, they should receive lawful money in payment; this claim they forego, and accept instead a 6 per cent. due-bill. It is easy to see how such an expedient may serve without further consequences where support of a few weak institutions is the object in view. But if all banks were to take out such certificates, and were to use them in payment of balances, the purpose of the device would be defeated. The result would simply be that no bank would pay cash for its indebtedness to other Clearing House institutions. In one month of 1893, no less than 95 per cent. of these balances was paid in loan certificates, and something like this must have happened last November.

But, obviously, what this signifies is that all the fifty-three Clearing House banks of New York city suspended cash payments to one another. From this it is but a step to suspension of cash payments to depositors; and to restriction on cash remittances against drafts by out-of-town banks, or on provision of "pay-roll money" to commercial depositors. The result, therefore, is the currency premium, the blockade of interior exchange, the suspension of payments at other banking centres, and the issue of checks for "wage money" at industrial centres.

This chain of events seems a fairly conclusive argument against the plan proposed by President Gilbert of the Clearing House Association, for the extension of the device of loan certificates under the form of law, to all of the banks of the country. This plan approaches the problem from the wrong side. Provision for a taxed "emergency currency," based on deposited assets of the banks, as the Bankers' Association plan provides, would do something to relieve the strain on bank reserves at a time of actual crisis. Reform in the practice of carrying insufficient cash reserves, and reform in the habit of basing large credit issues on deposits borrowed from other banks a thousand miles away, would do far more. The time has come for the thoughtful banker to grapple with this question of recurrent suspension of payments by American banks, and, without waiting until actual emergency is again upon us, make provision for the longer financial future. The theory, cherished by many intelligent bankers during the recent era of rapid expansion, that the consolidation and greater capital resources of our banks would prevent any relapse into primitive conditions, has turned out a mere delusion. Not only were payments suspended, as before, in the panic of 1907, but the area affected, the number of institutions involved, and even the duration of the period of restriction, were more serious than in either 1893 or 1873. For the good name of American finance, this ought never to occur again.

"The Causes of the Panic of 1893," by W. J. Lauck (Houghton, Mifflin & Co.), is a prize essay in the series established by Messrs. Hart, Schaffner & Marx. It reviews the industrial and financial history of the decade preceding 1893, and then describes the panic itself. In the account which Mr. Lauck gives of the conditions in Germany, France, and Great Britain his work supplements usefully A. D. Noyes's "Thirty Years of American Finance"; but in his discussion of events in the United States he adds substantially nothing to Mr. Noyes's narrative. By a process of exclusion of other possible causes, Mr. Lauck reaches the conclusion that the "fundamental and effective" cause of the financial disturbances of 1893 was the Sherman Silver-Purchase Act of 1890—a conclusion from which, we take it, few are likely to dissent at the present day. So far as the reviewer can find, our author does not even dignify by the barest mention the theory that the trouble was due to impending changes in the tariff. Since he is in search of "fundamental and effective" causes he is justified in refusing to consider this theory seriously; but as a contributary cause of minor importance, unsettlement due to proposed tariff legislation might well have been mentioned. We suppose that even a proposal to raise the tariff would lead to some hesitancy in investing capital in certain directions until the precise character and scope of the change should become known.

STUDIES IN THE HISTORY OF VENICE

By HORATIO F. BROWN. 2 vols. 8vo, pp. xiii—366 v—349. Net $6.00.

This distinguished student of Venetian history has given us in these volumes such a work as only a lover of Venice, and one having an extensive knowledge of the subject from long study could produce. It illustrates her history by the selection of certain crucial times and significant episodes in the formation, growth, and decline of the Republic. It is written with the fluent ease of a master of his subject and of his art.

SAINT CATHERINE OF SIENA

A study of the Religion, Literature and History of the XIV Century in Italy

By EDMUND G. GARDNER, M.A., author of "Dukes and Poets of Ferrara," "The King of Court Poets." 8vo, pp. xix-439. Net $4.00.

This work of the historian is, as the author says in his preface,

"not the conventional biography of a canonized saint, but a study of Italian history centered in the work and personality of one of the most wonderful women that have ever lived; while devoting my attention," Mr. Gardner says, "mainly to Catherine's own work and her influence upon the Italian politics of her age, I have endeavored to make my book a picture of certain aspects, religious and political, of the fourteenth century in Italy—the epoch that immediately followed the times of Dante, the stormy period in the history of the Church of which Petrarca and Boccaccio witnessed the beginnings."

SYRIA: The Desert and the Sown

By GERTRUDE LOWTHIAN BELL. With colored frontispiece and map and many illustrations. 8vo, xii-347. (New and cheaper edition.) Net $3.00.

When this book was published a year ago it was called by the reviewers with scarcely an exception "the best book of modern travel."

The ATHENÆUM says of it:
"After a searching criticism this book remains one of the best of its kind that we have ever read."

The SPECTATOR:
"An enchanting example of travel literature."

New York TRIBUNE:
"There are few books of travel which cast such a spell upon the reviewer."

FEBRUARY
CENTURY
"MIDWINTER NUMBER"

NO magazine is able often to make such an issue as this—so full of human interest and on such a high plane of literary and artistic achievement.

¶ Robert Hichens's article on "The Spell of Egypt" is one of the most exquisite presentations of the picturesqueness, wonder, and mystery of Egypt ever given to the world. One would know that the author of "The Garden of Allah" would write interestingly of the land of the Nile, but one might not think he would rise to such heights as this. And Jules Guérin's pictures, in full color, are as wonderful as the article.

¶ Here is Helen Keller's exquisite story of the world she lives in—a world of silence and of darkness, yet one that she finds "alive, ruddy, and satisfying." A unique and important human document.

¶ The article on Steichen, the painter-photographer; Professor Lowell on the similarity of the origin of life on the Earth and Mars; Lady Randolph Churchill's charming reminiscences, covering the exciting years just before the retirement of her husband from political life; capital stories, including a mystery story of the Colorado Cañon—all these go to make up a remarkable number of The Century.

On every news-stand. 35 cents. *THE CENTURY CO.*

The Nation.

NEW YORK, THURSDAY, JANUARY 30, 1908.

The Week.

If there were any doubt that Mr. Bryan intends to make himself the Democratic nominee again this year, it would be dispelled by his descent upon Washington and his bearing there. Secure in the control of the party machine, he has defied any man to come forward openly and challenge his domination. All Democrats who question his right to treat the party as his personal property, are instantly branded as either themselves among the powers that prey or secret agents of the predatory rich. And it must be said that the results of Mr. Bryan's arrogance vindicate his course. His enemies flee before him. The Democratic party says to him, like Sterne's donkey: "Do not beat me, but if thou wilt, am I not thine ass?" Mr. Bryan, with his hand on the local machine in so many States, knows that he can start a revolt against any politician who dares to oppose him. If a Southern Representative or Senator were to come out publicly for a candidate other than Bryan, there would instantly be talk of sending another man to Washington in his place. This is the true account of the paradox that Southern public opinion, as seen in many influential newspapers and voiced by business men and solid citizens generally, is against Bryan, but that so few Southern politicians venture to lisp against him. They want to get or keep office; he has or appears to have the disposal of offices; and so he keeps them cowed. That Mr. Bryan will be the Democratic candidate for the Presidency this year, if he chooses to be, may now be set down as among the political certainties. And those Republican managers are living in a fool's paradise who think that it will be a holiday task to beat him. He has a vast and idolizing personal following. Its vote can be transferred to no other. As a campaigner, he has inexhaustible physical energy. And on what willing ears his appeals would fall in present circumstances! The Republican platform of 1896 could be read as an indictment of the Republican party of 1908. All the dire consequences of misgovernment therein set forth are now swarming home to condemn Republican policies. Business has suffered deep hurt; mills have shut down; thousands of men are out of work; the unemployed throng the cities; the resources of charity are strained to provide for those in want by no fault of their own. Bearing in mind Mr. Bryan's extraordinary gifts as an agitator, and remembering how invariably the party in power loses popular support when depression overtakes industry and cripples enterprise, no one but a Republican drunk with complacency could deny that the coming campaign will test his party to the utmost.

The seriousness of the crisis should force the Republican leaders to cast about for their very best man to pit against Bryan. And here is where even the most rudimentary sense of political strategy leads men to think of Gov. Hughes. New York, as Bryan's managers admit, is absolutely indispensable to Democratic success. Bryan cannot win without New York. The Republicans might, but they would think it a fearful risk, as was confessed in Mr. Taft's letter, to plan a campaign leaving out this State. And the Bryan campaign is to be directed mainly at New York's electoral vote. Hence the proposal to nominate Lieut.-Gov. Chanler as Vice-President. Hearst is to lend a hand; Tammany will marshal its disciplined cohorts; and the immense unpopularity of the Roosevelt Administration in this State will be counted upon, too, to swing it back to the Democrats. With all this clear, it is elementary wisdom, the simplest prudence, for the Republicans to nominate a man who would be from 50,000 to 100,000 votes stronger in New York than any other candidate. Nor is this merely a question of local pride. The same qualities which have given Mr. Hughes commanding strength in his own State fit him to impress the nation. As against the Bryan-Hearst agitation, Hughes would stand for that calm and ordered progress, and even-handed justice, which must ever be the country's main bulwark against the demagogue and the uprooter.

Secretary Taft's manly and straightforward letter to Congressman Parsons insures a solid Hughes delegation from this State to the Chicago Convention. Mr. Parsons himself announces that he will not wait until February 20 to attach himself to the Hughes movement, but will call a special meeting of the Republican County Committee at once to pass the Hughes resolution which, by the aid of the local Federal officeholders, he was twice able to defeat. But it is mainly Mr. Taft who has shown that political acumen is not wholly lacking among those who are concerned with his candidacy. Without doubt, he would have taken the stand he did even if it were not a shrewd political move. It is in keeping with the popular conception of him as an outspoken man, with no other desire than to play the game in an open and above-board manner. Had the managers of his campaign, in and out of the White House, displayed an equal sagacity, they would never for an instant have opposed the Hughes sentiment in this State. By using Federal officeholders to make it appear that the State was not a unit, they performed an inestimable service for Mr. Hughes in uniting his friends and forcing them to begin an active warfare in his behalf. Had Mr. Roosevelt and Mr. Parsons been wise enough to let a formal resolution endorsing Mr. Hughes slip through the New York County Committee, the Governor's "boom" might simply have ranked with those of Messrs. Cannon and Knox, as that of another "favorite son." Instead, the national interest in Mr. Hughes has everywhere been quickened.

It was high time that the President took notice of the widespread complaint that he is using the whole power of the Administration to force the nomination of Taft. In a few days there is to be an official statement on the subject. According to Secretary Loeb, this will take the form of a complete list of Presidential appointments made since the canvass for Taft began, with the names of their backers. This is well, and the results ought to be enlightening, not only as regards the immediate charges, but in relation to the whole subject of "influence." But Mr. Roosevelt ought not to lose sight of the fact that the case by no means rests entirely upon political appointments. Those actually made in Taft's interest may prove to be only a handful. The real question of Presidential interference lies beyond such lists. Is it or is it not true that Mr. Roosevelt has openly taken charge of Secretary Taft's campagn? Is it or is it not true that he has repeatedly said to his visitors, newspaper men and others: "*We* are going to nominate Taft on the first ballot"? The exertion of the President's power in such ways may be more effective, and no less improper, than the apportionment of the spoils. Federal officials are not blind or deaf. They know what is meant by these tacit orders from the source of rewards and punishment. The inevitable effect upon them is to bring about precisely that political activity of postmasters and collectors and appraisers and marshals which we have seen. The process was accurately described by Swift, in his account of the way in which the Chinese Emperor conferred titles:

> This keeps the ambitious subject in a perpetual dependence, making him always vigilant and active, and in everything *conformable to the will of his sovereign.*

BURLINGAME
PUBLIC
LIB.

Judson Harmon's speech at Nashville last week had edge to it, and shows what sort of campaign the Democrats might make with such a man as their candidate. He smote Republican inconsistency and fraud about the tariff and about prosperity in the most hard-hitting fashion. With all the admitted glaring injustice and oppression of high-tariff taxes, he showed that no Republican, from the President down, had kept a single one of the many promises to revise the tariff by its friends. It has been much easier to take up the cry about corporations, but "it is folly," Mr. Harmon contended, "to rail at Trusts and pursue them with fines and injunctions while we carefully cherish the law which breeds and feeds them." With tariff exactions felt more than ever, as they now are in a time of depression, the chance of making a rousing and successful tariff-reform campaign this year would be excellent, were a convinced and vigorous low-tariff man like Judson Harmon the Democratic nominee. He would have the added advantage of having been appointed special counsel by the President to bring about the punishment of corporation offenders. Only, when Mr. Harmon proposed to move against a personal friend of Mr. Roosevelt's, the brotherless spear suddenly became a shield and buckler for Paul Morton. One nail driven by Mr. Harmon was clinched in Washington at the very time he was speaking. He declared that the standpatters, now in control of the Republican party, regard as "little better than traitors" any men who propose in any way to lift the burden of the tariff. Testimony to the truth of this statement was furnished by the angry outcry in the Senate over the German trade agreement. This was negotiated by Secretary Root, primarily to relieve American exporters from the danger of having the maximum German tariff clapped upon their goods. To avert this, some concessions had to be made, and they relate chiefly to the administering of our customs law. The effect in increasing German importations has been extremely slight, yet our tariff fanatics rage about it as if the foundations of the temple had been destroyed.

Secretary Taft's report on the Philippines is complacent, but in this respect he is exceeded by the President, who declares:

> Save only our attitude towards Cuba, I question whether there is a brighter page in the annals of international dealing between the strong and the weak than the page which tells of our doings in the Philippines.

Any one who should pick up Mr. Taft's report without knowledge of conditions in the islands would never dream that the question whether the Philippines shall or shall not be exploited for the benefit of this country is as pressing as ever. Moreover, Mr. Taft writes as if the idea of a colony to make us all rich and win the trade of the East never entered President McKinley's mind. About the blundering of our military officials, which made the breach with the Filipinos possible, Mr. Taft has not a word; but he repeats the stale charges that the Anti-Imperialists and Democratic leaders were responsible for the continuance of the insurrection. Why it was necessary just at this moment to rake up these old controversies is hard to understand, unless it is because of the imminence of the Presidential campaign. But, leaving this unhappy subject, we are glad to note in Mr. Taft's report news of the physical improvement of the islands. Moreover, the constabulary abuses have been ended, and that body of officers is no longer feared as an organization of spies and torturers. In his analysis of the progress of the Filipinos toward self-government, Mr. Taft shows a desire to be absolutely fair; but the world-old attitude of the conqueror towards the conquered reappears in his insistence that the day when the Filipino shall decide as to independence is still too far away to name. With the sedition acts still on the statute books, as un-American laws as were ever drawn, it is not quite ingenuous to say that, of course, criminal libel or seditious language calculated to cause public riot or disturbance is punished in the Philippines as in "many States of the Union." For the new Philippine Assembly, its wisdom and conservatism, Mr. Taft has only praise. We are sorry to record that the Secretary has receded somewhat from his courageous demand that Philippine sugar should be admitted free. On this issue, we had supposed Mr. Taft's flag would never come down. Yet he agrees to the proposal to limit free Philippine sugar to only 300,000 tons, thus consenting in part to a policy which both he and President Roosevelt have repeatedly denounced as morally indefensible.

Gov. Hughes's reply to the Brotherhood of Locomotive Firemen and Enginemen, who asked him why he had not "recognized" them when he appointed the Public Service Commissioners, is condemned by the union as "unsatisfactory." Naturally. Nothing would have been satisfactory save a confession of sin, a promise of reform, and a pledge to fill the next vacancy with a representative of labor, just as his predecessors always gave one of the railroad commissionerships to a railroad employee. With frankness and directness unusual enough in a Presidential candidate, Mr. Hughes says that he chose the men he considered best qualified. He is obviously correct in saying that if he tried to "make appointments for the purpose of satisfying particular interests, the result would be inevitably a patchwork of compromises." The Governor did not place on the Commission an officer of a railway company or a professional commuter or a representative brakeman or a dealer in railroad securities. He found difficulty in getting the men he wished to serve; but the Commissions represent his best judgment in what was a difficult problem. There are those who think that he might have made up a better Commission by disregarding localities and selecting a lawyer, an expert accountant, a leader in the profession of engineering, a bank official, and an electrical expert; but, as in everything else, he followed the dictates of his conscience.

A notable incident of the dinner of the New York city branch of the State Bankers' Association Monday night was David R. Forgan's clear statement of the part played in October's panic by the system of redeposit of national bank reserves in banks of other cities. The panic, Mr. Forgan observed, was not due to an insufficient supply of currency. The "currency famine" was the result of panic, not its cause. Why it should have been a direct result, Mr. Forgan thus explained, from the point of view of a practical Chicago banker:

> The way the law regarding reserves works is best understood by an illustration: The law requires a national bank in Troy, N. Y., to carry 15 per cent. reserve. Only 6 per cent., however, need be in its own vault. The other 9 per cent. may be with its reserve agent in New York city. If the deposits of the Troy bank are $1,000,000 it keeps $60,000 at home and $90,000 in New York. The $90,000 in New York, however, is not money. It is merely a credit on the books of the New York bank against which a reserve (allowing for legal deductions) of not more than $20,000 is kept by the New York bank. When the Troy bank, becoming alarmed, deems it prudent to have a larger proportion of its reserve at home it telegraphs the New York correspondent to send it, say, $20,000. That does not seem an unreasonable request to the Troy banker—only $20,000 out of $90,000. But when the Troy bank withdraws $20,000 it withdraws all the reserve there is in the world against its deposits except what is in its own safe, and the New York bank is left with a credit on its books of $70,000, against which no reserve now exists. When that transaction is multiplied by thousands and becomes general, it is simply an impossibility for the New York bank to stand it.

Mr. Forgan's conclusion was that the privilege now enjoyed by "country banks" of entrusting three-fifths of their reserve to banks in other localities, perhaps a thousand miles away, and subject to the extreme pressure of a panic of their own, ought to be drastically revised.

The meeting at Albany this week in behalf of the anti-tuberculosis campaign carried on by the State Charities Aid Association outside of this city will bring certain startling facts to the attention of the public. We have got so much in the habit of speaking of the great cities as breeding places for disease and crime, that it has generally been taken for granted that New York city, with its ghettoes, "lung" blocks, and tenements, must show the high record for sickness and mortality. As a matter of fact, Joseph H. Choate, who presided Monday evening, declared that in New York city the death rate from tuberculosis had decreased by nearly 50 per cent. within twenty years, whereas, it appears that the smaller up-State cities—Albany, Rome, Troy, and Utica—revealed an appalling growth of the malady. In 1904 New York city's general death rate of 20.56 per thousand was almost equalled by Utica with 20.23 and surpassed by Troy with 21.72. In 1903, Brooklyn showed a rate of 17.54 and swarming Manhattan a rate of 18.74, as compared with 18.06 for Rome, 19.25 for Albany, and 19.32 for Troy. It would appear, then, that, if our most densely populated city presents difficult conditions to deal with in the matter of the public health, they meet with a more than corresponding degree of effort; whereas neglect, especially in the case of tuberculosis, may more than overcome the natural sanitary advantages of any locality. With Panama made a habitable place, yet the upper counties of this State swept by consumption, people must come to take less pride in the purity of their native air and more in private and public cleanliness.

Once more the musical world mourns the premature death of one of its most gifted and promising sons. A strange fatality seems to pursue composers of music. Some of the greatest reached a ripe age, but a larger number, among them Mozart, Schubert, Weber, Chopin, Bellini, Bizet, passed away long before they had delivered their whole message; and now Edward MacDowell must be added to the list. It would almost seem as if the throes and thrills of creative work in the realm of tone were too great to be borne by any but a few of the most robust men. The epitaph placed on Schubert's grave, "Music has here entombed a rich treasure, but still fairer hopes," would have been appropriate for all the composers just named. MacDowell, too, was giving the world his very best when his brain was stricken. But if we are to have no more from his pen, there is enough to enable us to pronounce him the most original and poetic musician America has thus far produced. Not long ago Prof. John K. Paine died. He and MacDowell were the two leaders in their respective fields, and their demise leaves the outlook not altogether bright. We have other gifted composers, some of whom have won praise in Europe as well as America; but for a nation of eighty millions, the quantity and quality of our new music of the higher grades are very inadequate. The reason, to be sure, is not far to seek. The encouragement and support for composers of serious music are so lamentably small that only an irresistible impulse could ever justify a man in choosing such a vocation. Until within a few years, MacDowell could have hardly paid his house rent with his royalties. The same exceptional power exercised in almost any other profession would have made him wealthy. Until there is a general awakening of interest in the best music, but few of the most promising young minds are likely to yield to the allurements of creative work in music, and we shall continue to import from abroad.

French military authorities are again disquieted by the stationary population of France. M. Messimy, the *rapporteur* of the war budget, suggests that by enlisting under the French flag large numbers of Turcos and Spahis, the fighting efficiency of the army could be greatly increased. By this means, one hundred thousand excellent soldiers might be added to the French forces. This proposal the government is disposed to favor. One objection is the danger of arming and training so many Mussulmans. This has been met by a recommendation that African troops should be assigned to France, and particularly to Paris. The policy of garrisoning the capital with soldiers from alien provinces has been pursued successfully in Austria; there are always Czech and Hungarian regiments at Vienna. Those familiar with the Algerians contend, however, that no danger is to be apprehended from the native regiments, even if they should be kept in their own country. No Turcos or Spahis have taken part in any insurrection. Yet similar arguments were advanced concerning the Indian army in the days before the mutiny; and in international politics the fanaticism of Mohammedans is always an uncertain element.

Conditions in Berlin are not cheerful. The prestige of the monarchy is not enhanced when the sabring of the crowd gets to be the order of the day. Nor is Bülow's attitude in the Reichstag likely to appease public feeling. The German Chancellor has shown of late a fondness for treating the Deputies in an abrupt, schoolmaster fashion that would seem to be modelled on M. Stolypin's peculiar manner with the Duma. As a matter of fact, the political situation in Germany gives the Chancellor some reason for trusting to the tactics of a drill-master. By a dissolution and something of a *coup d'état* a year ago, he procured himself a "block" majority in the Reichstag, and not long since by a sharp threat of consequences he saved that block from going to pieces. His present policy, therefore, may be partly determined by the belief that in a contest with the Socialists he will have the Liberal "block" with him. What makes the recent conflict between the Berlin police and workingmen all the more sinister is that it should have been a crowd of unemployed, and not a political procession, that was charged by cavalry and assailed with naked weapons. Nor will the fact that the Socialists are making use of hard times to push their political propaganda go far towards removing the blame from the government. Rioting is, in part at least, the result of lack of opportunity to express popular demands. Had the Berlin workingmen been in a position to formulate their claims through spokesmen in the Prussian diet, street demonstrations might have been superfluous. As it is, the evil effects of economic crises will only go to swell the total grudge which the Prussian working classes are charging up against the government.

The English protectionists have been dashed by the Board of Trade returns for 1907, just issued. It will be remembered that Mr. Chamberlain based his agitation against free trade on the argument that that historic policy was ruining the country commercially. He chose for comparison 1872, a year of inflated prices, and 1902, a year of depression as a result of the Boer war. In that period of three decades the population of England had grown 30 per cent., while British exports had grown only 9. At Liverpool in 1903 he declared:

> My case is that the trade of this country, as measured—and I think it ought to be measured—by the exports of this country . . . has during the last twenty or thirty years been practically stationary.

He further explained: "You cannot go on supporting your population at that small rate of increase." That plea is now thoroughly shattered. The year 1906 had been very prosperous; but for 1907 the imports, exports, and re-exports amount to £1,164,080,913, as against £1,068,566,318 in 1906, an increase of £95,514,595. Separating the three factors, we find that the imports were £645,904,176, as compared with £607,888,500 in 1906; the exports £426,204,596, as compared with £375,575,338; and the re-exports £91,972,141, as compared with £85,102,480. If the exports of 1907 are set against those of 1877 there is an increase of 109 per cent., for only 30 per cent. in population. That is, if Mr. Chamberlain's method of reasoning—*post hoc, ergo propter hoc*—proves anything it demolishes the argument for protection.

SCIENCE IN LAW-MAKING.

Mr. Bryce's address before the State Bar Association last Friday night was marked by a breadth of view and a sanity of judgment which now seem to us second nature in him. He has evidently kept up his eager and penetrating interest in our affairs. No American could have studied recent tendencies in this country with a keener eye. At the same time, his ability to draw illustration and suggestion from English and French and Swiss and German practice gives a remarkable sweep to his view. To him, the problems of modern democracy are essentially the same, whatever may be their local variations. Hence it is that, in discussing the immense increase in legislation of all kinds and in all countries, he could deal with it as a world-wide question. One country may be in advance in one particular, and another in another; but all law-making bodies are face to face with the difficulty of passing an enormous number of statutes, while trying to make them clear in form and precise in effect.

The great need, Mr. Bryce contended, is to introduce more of scientific method into the processes of legislation. To investigate before acting; to collect all available data carefully; to consult the experience of others; then, when the passage of a given law has been determined upon, to place its drafting in skilled hands, so that the public may easily understand and the courts readily construe the new statute—such is the ideal which he held up before legislators. That approximations to it have been made by various State Legislatures is one of the good signs which Mr. Bryce notes. The bulletins of comparative legislation issued by the State Library at Albany, with such handy digests for the law-maker as are furnished by the Wisconsin Library Commission, mark a great advance. If haphazard bills, crudely drawn, still inundate Legislatures and Congress, the lack of instructive material, showing a more excellent way, cannot be held responsible.

Ignorance, however, is not the mother of all our legislative complexity and confusion. We have had only too much of a certain sort of "science" in our legislation. It is science in the slang sense—meaning uncommon cleverness in concealing one's real design. The various "jokers" which have got into important statutes were not put there by accident. The "slick" legislators who quietly secured their incorporation were not in need of instruction as to the proper form of bills. They knew perfectly well what they were about; and were "scientific" in the same way in which a football player or a prizefighter is said to be—that is, by a superior mastery of tricks and foul play.

Popular agitation behind a bill is also a sure provocative of careless draughtsmanship. When surging passions are enlisted, the cool and deliberate scrutiny of a scientific legislator is impatiently brushed aside. Hence comes the crudity of many a heralded measure, with the difficulty, and often the impossibility, of enforcing it. Mr. Taft has lately pointed out, what all lawyers knew before, that the Sherman anti-Trust act is so filled with ambiguities and contradictions that to construe it is the despair of a conscientious judge. A more recent instance is the railway-rate bill which President Roosevelt compassed sea and land to secure. One clause of it—that making it unlawful for a railroad to transport coal from its own mines—is now generally held to be unconstitutional. So convinced is the Attorney-General of this defect, that he has agreed not to prosecute violations of this law, pending a decision by the courts whether it was not beyond the powers of Congress. Yet the doubt which clung to this act was pointed out by Senators, such as Knox and Bacon, at the time of its passage; nevertheless the clamorous demand for the bill would brook no criticism. There stands the law in the books; but in this point and perhaps others it is a dead letter.

In connection with the same bill, we see how hard it would be in this country to follow one of Mr. Bryce's suggestions. It is that the workings of an important law be closely watched, with an eye to seeing how well it is or can be enforced, or what changes should be made in it. The great enemy of such care is popular fickleness. A sweeping movement is set up for the bill, the whole bill, and nothing but the bill; it is carried to enactment amid loud acclaims, and then the country proceeds speedily to forget all about it. Just before the passage of the Roosevelt railway-rate bill, a Senatorial champion of it was privately declaiming on its inevitability. "I tell you, sir, that when the American people rise in their might and demand a law of this kind, there is no withstanding their will." "Well, Senator," asked a bystander, "what will it amount to after it is passed?" "Nothing whatever," was the prompt reply; "the people will think no more of it, and will turn their minds to the next agitation."

We might go on to show how self-interest stands in the way of such rational legislation as Mr. Bryce advocates. He just hints at tariff laws, and urges that their effect in creating monopolies or working oppressively ought to be studied by a skilled and impartial commission. But no one knows better than he with what guffaws this proposal would be received by our standpatters. The very reason why they want the high tariff to remain untouched is that it gives them a monopolistic power to tax their fellow-citizens. Yet even against their entrenched selfishness better ideas are making slow headway. Mr. Bryce is no wall-eyed optimist. The evil as well as the good is clearly before him; so that when he bids us hope for the coming of more honest and more intelligent legislation in this country, only a wall-eyed pessimist will deny that there is ground for encouragement. When it is the deliberate verdict of this acute foreigner that there has not been, since the civil war, "among the best citizens of the United States so active a public spirit, so warm and pervasive a desire to make progress in removing all such evils as legislation can touch," as exist to-day, it is not for Americans to bate a jot of heart or hope.

THE "HARRIMAN SUIT."

Attorney-General Bonaparte has at length directed the filing of papers in the suit against the Union Pacific officers for conspiracy in restraint of trade under the Sherman Anti-Trust Law, by obtaining control of stock of parallel and competing lines. The suit is directed primarily against the acquisition of a controlling interest in the Southern Pacific—a railway which, like the Union Pacific, connects the Mississippi Valley with the Pacific Coast. Stress is also laid on the holding by Union Pacific, through its subsidiary lines or otherwise, of a minority interest in the Atchison, Topeka and Santa Fé, the Northern Pacific, and the Great Northern—companies also competitors of the Union Pacific.

It has been vigorously contended ever since the Northern Securities suit was entered, and particularly since the Supreme Court, in 1903, decreed the dissolution of that historic merger, that the Act of 1890 is being applied in a manner foreign to the purpose of its authors. The law, we are told, was aimed at monopolies in manufacture and other forms of production; yet these are precisely the abuses which, under the court's construction, have escaped its penalties. If the law is consistently applied to railways, it is declared to be a menace to the whole financial structure of the country; and if it is not consistently applied, then it is an engine of discrimination and oppression. Finally, comes the argument that the successful conclusion of the Northern Securities suit left matters really where they were before. The Great Northern still exercises undoubted control over the affairs of the parallel railways. These contentions are not without force. The Anti-Trust Law of 1890, we grant, ought to be replaced by a measure drawn with distinct provision for existing conditions, and not for those of eighteen years ago. But Congress has not seen fit to amend or replace the Sherman Act; and therefore law officers and courts are bound to invoke it wherever need of interference, as a question of public policy, arises.

Moreover, the statement that the Northern Securities decision accomplished nothing is wholly untrue. The conservative part of Wall Street will admit that a public service of the highest value was performed. The problem, clearly recognized by Mr. Knox, was to stop the deliberate plan of a few powerful capitalists to get the whole railway enterprise of the country irrevocably into their own grasp. Through their invention of the "holding company" and through their daring use of credit, they were rapidly buying up railways, regardless of price; paying for them in bonds of other railways; then lodging these other railways in the hands of a corporation whose own stock was issued in such huge amounts that the interests dominant at the hour of consolidation could never be dislodged. Mr. Morgan himself, in the Peter Power suit of March, 1902, testified that the $400,000,000 capital of the Northern Securities was large enough to prevent any "outside interest" from buying it up. This, in his judgment, insured "stable control," and he believed that result to be indubitably a public advantage. But the logical outcome of the theory of "stable control," thus applied and extended, would be permanent monopoly. The methods of capitalization indispensable to such combinations point straight towards corporation bankruptcy on a portentous scale. Holding these views, Mr. Knox seized on the most available weapon—an imperfect one, but sufficiently effective—and struck at the dangerous tendency of the day.

The case of the Union Pacific is not so closely analogous to the Northern Securities that those persons who approve the first suit will certainly endorse the second. For one thing, the primary purpose of acquiring the Southern Pacific lay in the Union Pacific's wish to own the Central Pacific line from Utah to the Pacific Coast. This Central Pacific Railway was geographically a proper part and supplement of the Union Pacific; it was so recognized by most people when it was built; but it was controlled by the Southern Pacific, and could be acquired only through buying that whole system. Yet in this case, as with the Northern Securities, the larger aspects of the question must be confronted fairly. In the Union Pacific's scheme of finance, during the past decade, control of Southern Pacific was only a single factor. Mr. Harriman has used the credit and surplus of his railway to buy stocks of other railways with unexampled recklessness. Purchase of stocks, with a view to getting a voice in the management, if not complete control, has been carried to an extent which left the public mind in dismay as to the possible limitations of the movement.

For the moment, a decided limit to such operations has been set by the panic of 1907, for the severity of which the Union Pacific's Stock Exchange operations were very largely responsible. This fact, indeed, was virtually admitted by Harriman himself, at the crisis of the panic, by his promise to consider the question of ridding his company of its holdings to other railways. With panic past, nothing further has been heard of this spasm of repentance, and the government's purpose now appears to be to find how far the pressure of the law can be applied. That the Sherman Act is an imperfect means to that end, no one can deny; but it may be the best we have, and the results of the suit, in the way of breaking down unsound and reckless practices of railway finance, cannot be wholly barren.

OUIDA AND HER POPULARITY.

The death of "Ouida" could not have been reckoned as a serious loss to literature had she passed away while still in her prime. Yet the news that the author of "Under Two Flags" has ended her life in poverty in Italy will bring genuine grief to thousands. No one confesses to admiring her novels, and yet every one has been amused by them. Stevenson, we remember, wrote from Samoa at the time of Lady Jersey's visit:

> We had great fun, and wrote a Ouida novel on our life here, in which every author had to describe himself in the Ouida glamour.

Among the "finer touches" were the passages in which "Belle and Lady Jersey came out to brush their teeth in front of the rebel king's palace, and the night guard squatted opposite in the grass and watched the process"; and in which "I and my interpreter, and the King with his secretary, mysteriously disappeared to conspire." Mystery, disappearance, conspiracy! Could any other three words describe so completely the ingredients of a popular novel? And yet Ouida appeals to persons of severe taste, as well as to the populace. Among the severe, we do not, of course, reckon Andrew Lang, who has shamelessly boasted of his excursions through Ouida's books, and even lower realms of fiction. There is, however, Tennyson, who, his son tells us, frequently re-read Thackeray, Scott, and Jane Austen. He hated "your modern novels, with numberless characters thrust into the first chapter and nothing but modern society talk; and also those morbid and introspective tales, with their oceans of sham philosophy." Reading this last kind he aptly compared to "wading through glue." These opinions certainly make him out a hanging judge in literature, yet he did not hang Miss Braddon, Miss Broughton, or Ouida. What, then, are the qualities that commend her to the intellectual prince as well as the pauper?

To this question, which applies not merely to Ouida, but to all of her kind, we can get no clearer answer than that offered by the devil's advocate. Mrs. Oliphant—and Tennyson enjoyed her, too—is as far removed as possible from Ouida. Mrs. Oliphant is very religious, even churchly; she is a stout upholder of the established order and all the polite conventions. She was a warm personal friend of Queen Victoria; while the scenes which Ouida depicts are, as the British matron remarked of "Antony and Cleopatra," "so unlike the home life of our beloved Queen." When Mrs. Oliphant, in her "Victorian Age of English Literature," came to contemporary novelists, she admitted the difficulty of discussing an author for whom she had so little sympathy. Yet Mrs. Oliphant's estimate of Ouida may be accepted as not unjust:

> A great deal of extravagance and a curious preference for the unsavory, as well as the high-flown, have done much to conceal from the reader the gifts of picturesque description and what is called word-painting, which this lady undoubtedly possesses. It is a dangerous gift, and has led in many cases to a riot of highly-colored words, in which imagination runs wild, and the sober mind is incapable of following—while it is almost impossible to tell what are her powers of drawing character, because her personages are chiefly of one character, and that a very conventional type. Notwithstanding this, she has achieved a great popularity, but is more acceptable to the public of a certain class than to critics of any kind.

This last sentence reveals Mrs. Oliphant's foible as well as Ouida's special strength. For "notwithstanding" substitute "because of," and you have a logical statement. It was because Ouida did not write for jaded and supercilious critics, and because she did write for a public which applauds the highly colored and the high-flown, that she achieved her wide popularity. Subtlety, delicacy, allusiveness, restraint in style—these are pearls that are thrown away on the mob of novel-buyers and borrowers. The man who runs as he reads wants the pigment laid on the canvas with a trowel, huge blotches of raw red and yellow, that will seize the most careless eye. And when he comes upon a particularly purple patch, as in the following bit from "Under Two Flags," he cries in his rapture, "This is a style that is a style":

> "My darling!—my darling! What have I done to be worthy of such love?" he murmured, while the tears fell from his blinded eyes, and his head drooped until his lips met hers. At the first utterance of that word between them, at the unconscious tenderness of his kisses that had the anguish of a farewell in them, the color

suddenly flushed all over her blanched face, she trembled in his arms, and a great shivering sigh ran through her. It came too late, this warmth of love. She learned what its sweetness might have been only when her lips grew numb, and her eyes sightless, and her heart without pulse, and her senses without consciousness.

"Hush!" she answered, with a look that pierced his soul.

The unsavory, too, which Mrs. Oliphant deplores, often makes a book fashionable. Mrs. Oliphant may never have suspected mankind of a weakness for the salacious; but a generation which revels in "Three Weeks" can have no illusions as to the squeamishness of popular taste. And as for the feebleness of Ouida's characterization—so long as the clothes and the dialect of the *dramatis personæ* are fairly differentiated, most of us ask for nothing more. If the dukes are diabolic and the duchesses dowdy, if the hero is portrayed as brave and the heroine charming, that is enough. Eloquence, ideas, skilful delineation of human traits—for Mrs. Oliphant's "public of a certain class," these qualities are mere dust in the balance.

But we have dwelt too long on the features that put a novel into the list of the "six best sellers," and those, surely, are not what attracted Tennyson to Ouida. The truth is, that, despite the higher critics and all her glaring defects, she went to the root of the matter with a lively story. Flamboyant rhetoric may sometimes recommend a lame tale to the undiscriminating; it cannot always spoil a spirited story, even for the fastidious. And Ouida, with her glamour—as Stevenson puts it—her mysteries and her conspiracies, frequently offers us what her admirers might call a rattling good yarn. When she takes up her pen, people do not dawdle round talking; they do something that grips the attention of the reader from the first page to the last; and, even if he has a developed critical faculty, lays it for the time under the spell of her magic. Her characters lead the strenuous life, both in adventure and in love; and that is a fascinating spectacle even for the contemplative philosopher and the cloistered poet.

"MODERNISM" AGAIN.

The echoes of the Pope's encyclical against Modernism are still reverberating in the religious and the secular press. The outward attitude of liberal Romanists is, we take it, fairly represented by the Dublin *Review*, edited by Wilfrid Philip Ward—son of William George Ward, "Ideal" Ward of the Oxford Movement. That periodical has, for a church organ, been fairly progressive; but it now assumes that the decision of the Pope is final and the question settled. Father George Tyrrell, however, who has already suffered the lesser excommunication, continues in the *Hibbert Journal* for January the outspoken criticism begun in his letters to the London *Times*. The same issue of the *Hibbert Journal* contains three other articles: "The Papal Encyclical from a Catholic's Point of View," by the Rev. Father Gerard, The Papacy in Its Relation to American Ideals," by the Rev. L. Henry Schwab, an Episcopal clergyman of Sharon, Conn.; and "The Catholic Church: What Is It?" by the Bishop of Carlisle. The Bishop and the rector —especially the latter—are pretty severe in their censures of Romanism. The Bishop assures us that, "while the world has been moving onward and upward, the Church of Rome has been falling downward and backward." Mr. Schwab deals out his denunciation with a gusto which recalls the "no-popery" cries of extreme Protestants a generation or two ago. He regards the Papacy as "to-day the greatest impediment to American liberty and the most serious menace to country and religion." Mr. Schwab's fears spring from his conviction that "an Italian ecclesiastic possesses to a large degree the power to maintain the intelligence and spirituality of millions of Americans on a level with his own."

This alarm we cannot share, partly because we draw reassurance from the articles of Fathers Gerard and Tyrrell. Father Gerard writes in a suave, irenic manner, as if he would like to make his omelet without breaking any eggs. He gives us an interesting statement of Modernism as a theory according to which things "may be true in their religious aspect, though making no claim to be true, scientifically or historically":

> Thus, for example, in the actual life of Christ there were no miraculous elements. He was not born of a Virgin. He did not rise from the tomb, nor ascend to Heaven. So far as Science has to do with them, these things are untrue. But they are true nevertheless in the province of religion; the actual facts of our Lord's life having been transfigured and refracted in the minds of His followers, whose common consent has evolved and communicated the attributes with which He is invested. . . . Thus . . . there can be no collision between Science and Faith, since they move in different planes, the one dealing with things as they objectively are, the other as subjectively "transfigured."

Modernism as thus presented, Father Gerard finds a feeble foe. He sees that for the masses of mankind the distinction can never be valid because it can never be intelligible. For "a flock of Breton or Tyrolese or Connemara peasants" dogma is necessary. But the real issue—that the modern scientific view of the laws of nature as uniform in operation destroys belief in the miraculous and in the dogmas founded on it—Father Gerard escapes by the familiar door. These dogmas, he tells us, have, during nineteen centuries, been held "true, beyond fear of doubt, for all times and places"; they are fortified by "the testimony of Christ," and "the teaching of His Church, safeguarded from error in her doctrinal office by the Holy Ghost." In fine, the dogmas are the foundations of faith and morality; therefore they must be true.

This reasoning will appeal to intelligent men quite as little as Modernism (as Father Gerard interprets it) will appeal to the peasant. If the Church's strongest defence against the assaults of science is an argument in a circle: we believe in the dogma of the Virgin Birth because of the teaching of Christ's Church; we believe in the Church because of the testimony of Christ—if this is all, then science will sooner or later batter down the wall. Peasants, we grant, will still ask for dogmas; and so will *intellectuels*. The present success of Mrs. Eddy's propaganda indicates that a powerful ecclesiastical organization might temporarily rest on the creed that two and two are five, and the moon is made of green cheese. But in the long run the truth as it is conceived by our most highly trained investigators and thinkers permeates the masses; and if a church is to be anything more than an insignificant "hole and corner" sect, its dogmas—however rigid its hierarchical system—must approximate the convictions and aspirations of the best minds in its environment. This is the immutable law of its being. As Father Tyrrell points out, Modernism is not a block of doctrine, but a point of view; it is an "attempt to reconcile the essentials of Catholic faith with those indisputable results of historical criticism which are manifestly disastrous to the mediæval synthesis of scholastic theology." It holds that in the end there must be a "perfect concord between faith and reason." In the contest with Galileo the Church was forced to yield; and so it will yield again. There may be a temporary embargo on ideas by the censorship which the Pope purposes to exercise over Catholic seminaries and colleges; but "to protect the laity from the contamination of history is practically impossible."

And—here is comfort for Mr. Schwab —even the attempt at protection is an absurdity in a country like ours, with free public schools. Whatever may be the condition or the religion of the unlettered millions in the year 1925 or 1950, the Church cannot retain its hold in perpetuity unless it secures as its leaders men of heart and mind. They must have some kind of education; and thus there will be a steady infiltration of Modernism. A few decades hence the tenets of Modernism, if it can be said to have any, may not be those of to-day; but the spirit will be much the same.

Slowly, imperceptibly, perhaps, but surely, intelligence subjugates the world:

> For while the tired waves, vainly breaking,
>   Seem here no painful inch to gain,
> Far back, through creeks and inlets making,
>   Comes silent, flooding in, the main.

CANADIAN LITERATURE IN 1907.

OTTAWA, January 24.

The old reproach against the Canadian reading public is rapidly becoming obsolete. To-day the meritorious work of Canadian writers is nowhere more thoroughly appreciated than in Canada; and more than that, English and American editions of Canadian books are not only immediately produced in Canadian editions, but many important Canadian books are now published originally in Toronto or Montreal. Toronto is, in fact, rapidly becoming an important publishing centre, and the time is not far off when it will be as much the rule for an English-Canadian book to bear a Toronto imprint as for a French-Canadian book to see the light first in Montreal.

During the year just closed the literary output of the Dominion has been creditable in quantity, and what is much more vital, in quality. The list embraces history, biography, fiction, and poetry, and it is in keeping with the awakening of a vigorous national spirit that the first of these classes should have received particular attention. Among the important historical works of the year by Canadians may be mentioned "Sixty Years in Upper Canada," by Charles Clarke, late clerk of the Legislature of Ontario (Toronto: Briggs); W. B. Munro's "Seigniorial System in Canada" (Longmans) (see the *Nation*, September 26, p. 283); "Canadian Constitutional History," by H. E. Egerton and W. L. Grant (Oxford Press); "Documents relating to the Constitutional History of Canada, 1759-1781," by Prof. Adam Shortt and Dr. A. G. Doughty (Ottawa: King's Printer); F. P. Walton's "Civil Code of Lower Canada" (Montreal: Wilson & Lafleur); William Dunlop's "Recollections of the American War of 1812-14," edited by A. H. U. Colquhoun (Toronto: Historical Publishing Company). C. Hill-Tout's "Native Races of British North America" (Copp Clark); and the "Voyages of Samuel de Champlain, 1604-1618," edited by W. L. Grant (Scribners). To the notable series of political biographies included in Morang's Makers of Canada, have been added A. G. Bradley's "Lord Dorchester," James Hannay's "Wilmot and Tilley," and Prof. S. B. Leacock's "Baldwin, Lafontaine, Hincks." Canadian history also forms an important part of the Duke of Argyll's "Passages from the Past" (London: Hutchinson). It will be remembered that the Duke of Argyll (then the Marquis of Lorne) spent several years in Canada as Governor-General. Though the material is not yet available in book form, it is proper to mention here the political "Reminiscences" of Mr. Justice MacMahon, which have been appearing from time to time throughout the year in the Toronto *News*. "Canada," by Dr. Wilfred Campbell (Macmillan), which has already been reviewed in the *Nation* (August 15, p. 148), is rather notable on account of the charming series of colored illustrations by the Canadian artist, T. Mower Martin, than because of its historical value.

During the year has also appeared the initial volume of the publications of the Champlain Society—"Marc Lescarbot: Histoire de la Nouvelle-France," the original text with an English translation by W. L. Grant, and an introduction by H. P. Biggar, author of "Early Trading Companies of New France." Among other publications already arranged for by the society, and now in course of preparation, are Denys's "Description and Natural History of Northern America" (Acadia) 1672, translated and edited with a memoir by Prof. William F. Ganong; "Documents relating to the Seigniorial Régime in Canada," edited by Dr. W. B. Munro; "The Cartwright Papers, 1778-1814," edited with introduction and notes, by Prof. Adam Shortt; "Naval Records of the Conquest of Canada," edited by Major William Wood, author of "The Fight for Canada"; "Louisbourg, from its Foundation to its Fall, 1713-1760," by F. S. McLennan; and the "Journals of La Vérendrye," edited with introduction and notes by Lawrence J. Burpee. Among the more important papers published in the current volume of Transactions of the Royal Society of Canada, are Dr. Ganong's "Additions and Corrections on the Place-nomenclature, Cartography, Historic Sites, Boundaries and Settlement—origins of the Province of New Brunswick," with maps; James H. Coyne's sketch of Richard Maurice Bucke; "Fleury Mesplet, the First Printer of Montreal," by R. W. McLachlan; "The Downfall of the Huron Nation," by C. C. James; Benjamin Sulte's "Commerce de France avec le Canada avant 1760"; "Les successeurs de la Vérendrye, sous la domination française," by Judge Prud'homme; and F. J. Audet's "République d'Indian Stream." Two important supplementary volumes to the twelfth volume of Transactions of the Royal Society contain respectively Dr. N. E. Dionne's "Inventaire chronologique des livres, brochures, journaux et revues publies en langue anglaise dans la province de Québec, depuis l'établissement de l'imprimerie au Canada jusqu' à nos jours, 1764-1906"; and Benjamin Sulte's exhaustive Index to the First and Second Series of the Proceedings and Transactions of the Royal Society of Canada. In addition to Shortt's and Doughty's "Documents relating to the Constitutional History of Canada, 1759-1791," already mentined, which is to be followed from time to time by additional volumes embodying eventually all essential documents on the subject, the Dominion Archives issued during the year two volumes of important material bearing on the history of Canada. It was decided some time ago to supplement these annual publications by periodical bulletins designed to contain historical journals and other special material. The first of these bulletins was to have appeared before the close of 1907, but publication was delayed, and it is now expected to issue in February.

In Canadian fiction, the year's record contains but few new names. Charles Roberts produced a volume of animal stories, "Haunters of the Silences," with spirited illustrations by Charles Livingston Bull (L. C. Page & Co.), and a new edition of his translation of De Gaspé's "Anciens Canadiens," under the title "Cameron of Lochiel" (Page); his brother, Theodore Roberts, has upheld the traditions of this versatile Canadian family by two readable stories, "Hemming the Adventurer" and "Red Feathers" (Page); Arthur Heming, hitherto known as one of the best of contemporary illustrators, has joined the company of novelists with his "Spirit Lake," a tale of Indian and trapper life in the far Western fur country (Macmillan); Sir Gilbert Parker adds another to his long list of novels in "The Weavers" (Copp Clark); and Arthur Stringer provides a sequel to "Wire Tappers" in the even more sensational "Phantom Wires" (Little, Brown & Co.). Other Canadian novels of the year are W. A. Fraser's "Lone Furrow" (Appleton); Norman Duncan's "Cruise of the 'Shining Light' " (Harpers); W. W. Campbell's "Ian of the Orcades," a romantic story of old Scotland (Revell); J. A. H. Cameron's "Colonel from Wyoming" (C. P. A. Pub. Co.); Anison North's (Miss May Wilson) "Carmichael," a tale of rural life in Ontario (Doubleday); and Basil King's "Giant's Strength" (Harpers). Of these, two are new writers, Miss Wilson, a native of Ontario, and Mr. Cameron of Nova Scotia.

It has been a lean year in Canadian poetry, the only notable contribution being Robert W. Service's little book of vivid, though somewhat rugged, verse, "Songs of a Sourdough" (Briggs). Though in places perhaps too suggestive of Kipling, these verses have a value of their own as reflecting the strenuous life of the Yukon mining camps. In "The Woman in the Rain and other Poems" (Little, Brown), Arthur Stringer has gathered a number of dramatic and lyric poems of much more than average merit; and Jean Blewett, in "The Cornflower" (Briggs), reveals much of the grace, humor, and pathos characteristic of the work of Eugene Field. During the year Canada lost one who had perhaps done more than any other to reveal the characteristics of the French-Canadian *habitant*, William Henry Drummond.

It remains to record a few miscellaneous publications. Of these, James White's "Atlas of Canada," issued by the Dominion government, is of exceptional interest and value, covering an extraordinary range of matter. H. G. George's "Geography of the Dominion of Canada" (Oxford Press) is an authoritative work upon the subject. Two volumes of essays worthy of mention are Bliss Carman's "Making of Personality" (Page), and W. F. Hatheway's "Canadian Nationality and other Essays" (Briggs). In a substantial volume, the University of Toronto records the history and development of that important institution. Of works bearing on Canada by foreign writers, two at least should be mentioned: Justin H. Smith's "Our Struggle for the Fourteenth Colony" (Putnams), and André Seigfried's intimate study of Canadian problems from a French point of view, "The Race Question in Canada" (Appletons). The *Revue Canadienne* marked the completion of its fifty-third volume by the publication of a comprehensive index to the entire series, an examination of which reveals the wealth of material available in this little-known review. The list of contributors includes the names of practically every well-known French-Canadian writer of the last half-century. The long-felt want of an adequate review for English-Canadians has been filled during the past year by the reorganization and enlargement of the *University Review*, whose purpose is described as "to express an educated opinion upon questions immediately concerning Canada, and to treat freely in a literary way all matters which have to do with politics, industry, philosophy, science, and art." The editorial committee includes some of the best men on the faculties of the Canadian universities, and the quality of the articles that have appeared in the four quarterly numbers issued in 1907 is excellent. L. J. B.

NEWS FOR BIBLIOPHILES.

The second volume of Dr. Bradford's "Bibliographer's Manual of American History," just published, shows little if any improvement upon the first. A pair of scissors and a paste-pot, a pile of catalogues of auctioneers and dealers, and some of the old reference books like those of Rich, Stevens, and Sabin, seem to have been all the tools used. Perhaps 25 per cent. of the entries have an asterisk affixed showing that the books themselves have been examined, but almost without exception the bibliographical notes are quoted, mostly from Joseph Sabin, Obadiah Rich, Henry Stevens, and Thomas W. Field, men who read the books they described, and whose notes have been common property of every cataloguer since. Admirable when written, they now, at least when they deal with the rarity and value of books, require correction. For example, under Filson's "Discovery, Settlement, and Present State of Kentucke," no less than five notes are quoted about the rare map made for the 1784 edition, all to the effect that no more than a single impression is known. As a matter of fact, six impressions (at least) are now traceable. To the Sermon of William Hubbard, "The Happiness of a People in the Wisdome of their Rulers," Boston, 1677, Rich's note, "This volume is believed to the first printed in Boston," is quoted without comment, though it is well known that Foster began printing in Boston in 1675. Under "Gent (E. W.)" is recorded a reprint of Edward Williams's first book on Virginia, "Virgo Triumphans; or Virginia richly and truly Valued," 1650. This entry is corrected in the errata at the end; but Williams's second book, "Virginia's Discovery of Silk Wormes," also printed in 1650, is entered, without comment, under "Farrer (John)." Though Williams got his information mostly from Farrer, "a gentleman of merit and quality," Farrer was not the author of the book. The sale records appended to many titles sometimes fill a quarter page without arrangement, and are difficult to refer to. In the case of some of the rarer books, no records, or only antiquated ones, are given. For example, the only record under Gorges's "America Painted to the Life," 1659, is £4 6s. paid at Puttick & Simpson's in 1861. "Auction Prices of Books" shows eleven more recent records. The classified index, which is to form Volume V., will, if properly prepared, no doubt be useful to collectors, students, and dealers, but the two volumes so far published are certainly a disappointment.

Volume VIII. of the Transactions of the Bibliographical Society recently issued, contains addresses on bibliographical topics, delivered at various meetings, as well as a short title catalogue of the books in the society's library. One of the most interesting of the papers is that by H. B. Wheatley on "Dr. Johnson as a Bibliographer." "Notes on the Types, Borders, etc., used by Thomas Berthelet," by W. W. Grey, with numerous facsimiles, is another valuable paper.

On February 3 and 4 the Anderson Auction Company of this city sells the library of Charles R. Adams of Minneapolis. Included are first editions of Holmes, Longfellow, Emerson, Whittier, and other American writers, though the more common books only are generally represented. A book from the library of William Penn, with his book-plate and Vols. I. and II. (all issued) of *The War*, a periodical published 1812-1814, and edited by Samuel Woodworth, are notable items.

On February 4, the Merwin-Clayton Sales Company of this city offers a collection of autographs, including good specimens of John Quincy Adams, Elias Boudinot, Elbridge Gerry, James Madison, John Tyler, Daniel Webster, Hawthorne, Holmes, Longfellow, and Lowell.

Correspondence.

THE CORNELL EXPEDITION TO ASIA MINOR.

To the Editor of The Nation:

Sir: The Cornell expedition to Asia Minor and the Assyro-Babylonian Orient, conducted by Dr. A. J. Olmstead and his associates, B. B. Charles and J. E. Wrench, was intended to be educational in character; that is, its primary object was to make the members of the expedition familiar by actual autopsy with the topography, physical geography, natural trade routes, and in general with the lay of all the regions covered by Oriental history. But the organizer of the expedition—which was made possible by the generous contributions of a number of men of wealth—ventured to hope that the members would also be able to show material results, and to make valuable contributions to existing knowledge. The men spent the entire summer and fall in Asia Minor; they are now in Assyria or Persia. But the hope of the organizer has already been realized in Asia Minor alone, and that too along many lines. It has been demonstrated once more that Asia Minor is not the well-known country which some people imagine it to be.

The work of the expedition in Asia Minor was purely a surface exploration, topographical and archæological. The topographical results alone would justify the labor and expense, for henceforth they will be recognized as starting points for the elaboration of the geography of neighboring regions. The training of the men in Assyriology forced them to look at Asia Minor from the pre-Hellenic, rather than from the Hellenic or Græco-Roman point of view. For that reason they have hunted with the geatest care for the footprints of that early civilization which most scholars now call Hittite. In the Hittite "Corpus" there are nineteen inscriptions from the regions traversed by the Cornell expedition. Of this number, eleven are still in situ, and all of them were carefully studied and collated. Important additions and corrections were made in the nine longest inscriptions. In the case of two, a good half has been added, while the longest of all, that at Boghaz Köi, is practically a discovery of the Cornell expedition, for Winckler says that it is utterly illegible. At Kara Burun (near the Halys) additions and corrections were made to the copy of the inscription already taken, and an entirely new inscription, engraved by the same hand, was found fifteen inches above the old one. The expedition also secured the Hittite inscription on the black basalt stone at Bogcha on the Halys. The stone was discovered long ago by Belck, but it has not been copied or published, so far as known. The stone is evidently not in its original home. The nearest possible site to which it could be assigned is Hadjilar Kalessi, three hours further up the Halys. At Ivriz (near the Cilician Gates) the well-known rock-sculpture was studied; and by turning aside from the mill race the water which partly covers the inscription, a number of symbols were recovered, and the object beneath the feet of the god was identified as the stock of the grapevine. The prototype of this Ivriz sculpture, which was discovered by Mrs. Wylie of the British consulate in Konia, lies half an hour from the well-known rock-sculpture, but not the faintest trace of an inscription could be discovered. Mr. Charles has reasons for regarding the site as an oracle-cleft (like the Yazili Kaya at Boghaz Köi), which, because of its sacred character, was adopted as a holy place by the Christians of a much later period. Additions were also made to the inscription at Gürün on the Tokhma Su.

But the work of the expedition was not confined to the mere collation of already known inscriptions, for the members have discovered *ten* quite new Hittite inscriptions; one at Eghri Köi, southeast of Develi Kara Hissar; two at Tekir, between Everek and Kaisariyeh; one at Assardjik, an hour and a half south of Kaisariyeh; and the rest on the Tokhma Su, in the Melitene region. At Isheyuk, below Derende, the Cornell men came upon some Hittite sculptures and five inscriptions, the remains of a once splendid monument, which should be transported to the Imperial Museum at Constantinople. The sculptures depict a group of three men and a fourth man standing on a magnificent charging bull. A Hittite inscription on a cliff overhanging the Tokhma Su was discovered at Kötü Kale. These details I give in order to claim for the members of the Cornell expedition the rights belonging to priority of discovery.

Dr. Olmstead writes with great enthusiasm of Arslan Tepe, a mound in the vicinity of Melitene, which he regards as the best site in Asia Minor for combined excavation and exploration. The mound is not so large as are those of Iconium (32 acres), Kül Tepe, near Caesarea-Mazaka (22 acres, still undisturbed by the natives), and Tyana (of vast area); but still it is 75 feet high, 300 feet by 75 feet at the top, 500 feet by 300 feet at the base. The top contains Byzantine ruins, which are mere surface rubbish; the Hittite stratum reaches to 50 feet from the ground, while the lower stratum, 50 feet in depth, belongs to the pre-Hittite civilization. The mound has already given up two inscribed Hittite sculptures, which are now in the Constantinople Museum. Four more of great interest and importance are now lying in the Serai yard. In the mound itself Mr. Wrench found a huge stone decorated with a fine lion and a Hittite inscription. Some digging has been done by the natives. The mound is a magnificent site for determining a full series of pottery levels. Painted pottery is abundant—mostly black on yellow, a new type. Fine black glaze ware is common.

In view of all this Dr. Olmstead is clearly within safe bounds when he declares that the results reached thus far are rather larger than those of any other expedition. This is no small achievement for an enterprise whose primary object was purely educational; and these facts open our eyes anew to the importance of intensive explorations even on the surface. As a result of such work by the Cornell expedition the Hittite "Corpus" will have to be republished.

Arslan Tepe is well situated for the exploration of the whole Trans-Antitaurus region, and excavations will certainly bring untold treasures to light. Twenty-five thousand dollars will probably suffice for the excavation of Arslan Tepe and for the exploration of the country round about; and such exploration is sadly needed, for the whole region north of Isbeyuk and Kötü Kale is unknown. A much larger sum of money will be needed for the excavation of the vast pre-Hellenic cities of Tyana, Iconium, and Kül Tepe. But the science of the past, through the lips of those who cultivate it, demands that all of these sites and many other smaller ones be excavated without delay. There would be large returns for the institution or the individual who would excavate in Cappadocia and at Hittite sites elsewhere for a period of at least twenty or twenty-five years. These excavations ought not to be delayed for a single year; for ancient monuments of all kinds are perishing every day at the hands of both Mohammedans and Christians.

Ithaca, N. Y., January 25.

ORIGIN OF THE TERM "BENDS."

TO THE EDITOR OF THE NATION:

SIR: In connection with the immense tunnel operations under the North and East rivers a word has come into common use to designate that ailment which seizes workmen withdrawing themselves too suddenly from the compressed air chamber. All your New York papers call this ailment "the bends." The more usual term is "caisson disease." I have not found the word in any dictionary, not even in Bartlett, ed. of 1884, nor in the papers of the American Dialect Society. Can any one of your readers tell me where and when the word "bends" originated? J. M. HART.

Cornell University, Ithaca, N. Y., January 22.

ORGANIZATION OF SCHOOL BOARDS.

TO THE EDITOR OF THE NATION:

SIR: In your issue of January 9, "Elres" raises two serious questions with regard to control of public schools, in his suggestions for a paid board and for separate boards for grammar schools and high schools. As to the first point, the experience of this city with salaried trustees may help to a conclusion. At first the trustees received no compensation, but after a period of turmoil and upheaval Congress provided $500 yearly for each of seven members. The result was not satisfactory, though the plan was faithfully tried for six years by men and women of first rank in character and ability. After another period of agitation and dissatisfaction the law was repealed and a return made to the former system. The exact cause of the failure could not perhaps be positively determined, but with a fair test for such a long time, when new blood was coming in every year, it seems reasonable to conclude that the plan carries its own seed of destruction.

With regard to different authorities for the two grades, this much can be said: that the whole trend of life in this country is towards unification of responsibility. As a people we seem to be striving to place power in as few hands as possible. With a double-headed system such as "Elres" proposes there would be a gap of doubt, and friction, and finally a clash of authority. To refer to analogy, the child has one guiding hand from infancy to manhood, that of his parents; and as the school is a large family, we can only follow the road that has been pointed out by thousands of years of evolution. R. S.

Washington, D. C., January 22.

QUALIFICATIONS OF CABINET OFFICERS.

TO THE EDITOR OF THE NATION:

SIR: I have puzzled my brain for at least the last thirty years to determine what constitutes the qualifications of a Cabinet officer. Is it eligibility, ability, fitness, or political "pull," as it is called? So far as I have been able to ascertain, hardly any one who has been chosen to fill one of these high positions (except that of Attorney-General) has had any preliminary training or showed any peculiar fitness previous to his appointment. Is it good-fellowship or a happy-go-lucky chance if such a choice discharges his duties creditably? Or does the American possess such a versatility of talents that, without any special preliminary training, he can fill acceptably any office which it is his good fortune to obtain? Should not the Secretary of the Treasury have had before his appointment some special training in finance or political economy? Is it not necessary for the Secretary of the Navy to have had some previous knowledge of naval affairs? I desire most earnestly the answer to this question; for I fail to see any guiding principle laid down for making up the Cabinet.

F. C. CLARK.

Providence, R. I., January 21.

THE CANALS ON MARS AGAIN.

TO THE EDITOR OF THE NATION:

SIR: After reading Mr. Agassiz's letter and the comment of the reviewer. in your issue of January 16, curiosity led me to inquire as to the actual mileage of canals on the earth. I find that there are probably nearly 30,000 miles of navigable canals now in use (exclusive of rivers, on which much labor has been spent for purposes of commerce). To this may be added a very considerable mileage of canals built solely for irrigation.

Comparing the labor cost with the impelling motive in the two cases, and leaving much unsaid as to the relative effectiveness of labor on the two planets, it does not seem "incredible" that 600,000 miles of canals should have been built on Mars under the conditions which Professor Lowell supposes to exist there.

ROBERT W. WILLSON.

Cambridge, Mass., January 21.

[The earth's surface is four times as large as that of Mars; therefore, in comparing canal mileages, we should include the factor 4, making Professor Willson's figures 30,000 to 2,400,000. Moreover, the estimate of 30,000 for our earth is probably quite accurate, while for Mars we cannot assume that observation reveals more than a fraction—probably a small fraction—of the total existing mileage. Finally, if we postulate increased efficiency in the Martian laborer because the planet is small we should also postulate an exactly proportionate diminution of that laborer's size and strength.—THE REVIEWER.].

Notes.

The Macmillan Company has on its spring list, as usual, a notable number of books on economics and sociology. These include "England," by Prof. A. Lawrence Lowell, a scholar of Mr. Bryce's school; "Modern Egypt," by Lord Cromer; "The United States as a World Power," by Prof. A. C. Coolidge; "The Coming Struggle in the East," by Putnam Weale; "The Science of Jurisprudence," by Dr. Hannis Taylor; 'New Worlds for Old," by H. G. Wells; "The Socialists at Work," by Robert Hunter; "Social Psychology," by Prof. Edward A. Ross; "Primitive Secret Societies," by Prof. Hutton Webster; "As Others See Us," by John Graham Brooks; "Essays in Municipal Administration." by Prof. John A. Fairlie; "Popular Participation in Law-Making," by Prof. C. S. Lobingier; "Government by the People," by Robert H. Fuller; "Principles of Taxation," by Dr. Max West; and "Education and Industrial Evolution," by Prof. Frank T. Carlton.

Longmans, Green, & Co. have ready a new instalment of the studies of local government by Sidney Webb and his wife. The two volumes now to be issued are on "English Local Government from the Revolution to the Municipal Corporations Act: the Manor and the Borough." This is the first thorough account of such administration between the years 1689 and 1835.

A study of "English Society in the Eleventh Century," by Prof. Paul Vinogradoff, will soon come from the Oxford University Press. The author takes the eleventh century as the "watershed" in the development of England and examines the various political, legal, economic, and social factors then at work.

Bliss Carman has a new volume of essays, "The Making of Personality," which is announced for this spring by L. C. Page & Co.

John Lane Company announces for publication this spring a book on "Ceylon," by

Caroline Corner. It is said to be an intimate picture of native life in that Island, with accounts of the various dances and religious ceremonies.

The new Tennyson now coming out in the Eversley Edition (The Macmillan Co.) will be the standard, no doubt, for many years, and may be definitive. The plates apparently are the same as those of the old six-volume edition, and the crowding of matter sufficient for eight of the ordinary Eversley volumes into six means thinner paper and a less pleasing book than we are accustomed to in that most desirable format. It may be presumed that the remaining volumes will follow the plan of the first now before us. Here an appendix of some one hundred and thirty pages is added, containing poems hitherto rejected and a series of notes by the poet and by his son, Hallam Lord Tennyson. In the present case, the additional poems are of little interest, with the possible exception of "Timbuctoo," the college exercise, which affords an interesting basis for a study of the development of Tennyson's blank verse. For the most part, the lines drag rather loosely, but here and there one catches the distinctly Tennysonian trick, as in this half-Miltonic repetition:

> The silent heavens were blench'd with faery light,
> Uncertain whether faery light or cloud.

The poet's notes deal largely with the question of plagiarism, giving his classical sources and explaining away other parallels. Some information is imparted in regard to the persons characterized in various poems, but the notes fail us at the crucial points. Thus, for the lines beginning "With a half-glance upon the sky," the bitterest and almost the cleverest Tennyson ever wrote, there is a quotation from Edward FitzGerald, but not a word to indicate whether they really apply to William Thompson, later in life the sarcastic Master of Trinity College. One of the most interesting notes shows Tennyson's anxious concern for the pronunciation of his verses. He first quotes a line of "The Gardener's Daughter" together with a couplet of Shakespeare's, thus:

> *The mellow ouzel* (pronounced *oozel*), *fluted in the elm*,
> "The wooselcock so black of hue,
> With orange-tawny bill."
> Mid. Night's Dream, iii. i. 128.

Whereupon he adds sardonically:

> The merry blackbird sang among the trees

would seem as good a line to nine-tenths of all English men and women. Who knows but that the Cockney may come to read it:

> The meller housel fluted i' the helm.

Who knows what English may come to?

A good edition of Campbell's Poetical Works, long mildly desired, is now offered in a single agreeable volume by Henry Frowde. It is called complete, and does in fact contain considerably more than any previous edition; but the editor, J. Logie Robertson, does not hold that the word necessitates the reprinting of purely ephemeral verse which has no place under the head of "Works." The mania for resuscitating rubbish makes the reading of the old poets every year more of a pedantic task and less a means of culture, and any editor is to be commended who resolutely sets his face against this temptation. Mr. Robertson is further to be commended for arranging the poems by large natural groups, instead of the strict chronological order which is commonly the most awkward for reading, and the most difficult for reference. His notes also are sufficient. No poet, as a whole, has suffered more in reputation than Campbell; even Rogers is probably more read to-day. Standing midway in style between the old Augustan school, and the new romantic movement, he satisfies for the most part neither taste. One of the surprising facts of literature is that the same man should have written "Gertrude of Wyoming" and the little group of battle songs that have made his name famous. A careful glance through the pages of his complete works—which the present reviewer confesses not to have taken before for many years—will, perhaps, lessen this surprise; and while it may be too much to say, with the editor of the volume, that we rise from such a reading with a feeling of indignation that Campbell is at present so much neglected and with the conviction that a later generation (that last infirmity of noble critics!) will do more honor to his memory, yet we can truthfully admit considerable pleasure at this reknitting of an old acquaintance.

In the same Oxford Edition the Complete Poetical Works of Shelley are now printed, with textual notes by Thomas Hutchinson, who edited the Oxford Wordsworth. The bulk of Shelley's verse makes rather an unsightly page necessary in this format, but the text, under Mr. Hutchinson's careful hands, is brought to the highest degree of accuracy, and there is a small amount of new material. The "Original Poetry by Victor and Cazire," is included, as also are the "Juvenilia," the "Poems from St. Irvyne," and the "Posthumous Fragments of Margaret Nicholson."

No man with intelligence and taste and with the whole body of English letter-writers to draw upon, could fail to make an interesting volume of selections. But that fact does not lessen the credit due E. V. Lucas for his uncommonly entertaining anthology of letters, "The Gentlest Art" (The Macmillan Co.). In work of this kind Mr. Lucas is very successful. He has arranged these letters not chronologically, but in groups under such headings as "Children and Grandfathers," "The News Bearers," "The Familiar Manner," "The Grand Style," "Urbanity and Nonsense," and "Shadows." The little book contains some of the most delightful bits from Lamb and the other famous letter-writers, and also a few fictitious letters from the novels of Thackeray and Dickens. On a somewhat different plan are two recent additions to the London Library, published in this country by E. P. Dutton & Co.: "Letters of Literary Men: Sir Thomas More to Robert Burns," and "Letters of Literary Men: Nineteenth Century," both edited by Frank Arthur Mumby. Mr. Mumby gives sample letters from practically all of the important men in the history of English literature. Concerning each writer he gives enough information in an admirably concise note, to make the letters intelligible. We regret that in order to offer samples of every one, including Shakespeare, Mr. Mumby has sometimes had recourse to epistles dedicatory, which are hardly letters in the proper sense, and which in their formality or conventional flattery of a patron reveal very little of personality. The result is that the first third of the first volume is needlessly heavy reading: it is not till we come to the letters of Swift, Gay, Pope and Steele that the interest is fairly sustained. We fear that casual readers may not persevere through the dry pages at the beginning to the excellent matter that comes later. Both of Mr. Mumby's volumes are carefully indexed.

It cannot be denied that there is a strange pathetic interest in "Queen Mary's Book" (The Macmillan Co.). One may discount the enthusiasm of Mrs. P. Stewart-Mackenzie Arbuthnot in her introductory "Character of Mary Stuart," and, without being too confident in accepting or denying the criminal charges against the Queen, one may feel, as apparently Mrs. Arbuthnot cannot, that her religious writings, while perfectly sincere emotionally, may yet be compatible with moral turpitude. The pathos of the book lies in the poems and prose compositions of the Queen herself, which are here for the first time brought together in a single volume. These are given in the English version of Miss Strickland or of the present editor, and are for the most part smoothly translated. In some cases the original Latin or French is printed in an appendix; our only quarrel with the book is that all the originals are not added. It is true that some of the best-known of the poems, such as the "Verses on the Death of Francis II.," and the lines "O Domine Deus, speravi in te," are of doubtful authenticity; it is true, also, that the "Exercizes Written in 1554" (when Mary was twelve) bear strong evidence, as Mrs. Arbuthnot will scarcely admit, of being dictations rather than original compositions; but there remains enough to show the heart of the suffering, if not the erring, Queen—*infelix fatis exterrita*. These girlish exercizes, whether dictated or original, with their insistence on the virtue and wisdom of princes—how ironical their simplicity shows against the background of facts. What grim tragedy in the Sonnet to Elizabeth, her "dear sister," supposed to have been written soon after Mary's arrival in England. Very aptly Mrs. Arbuthnot connects the close of this sonnet—

> Ah! I have seen a ship freed from control
> On the high seas, outside a friendly port,
> And what was peaceful change to woe and pain:
> Ev'n so am I, a lonely, trembling soul,
> Fearing—not you, but to be made the sport
> Of Fate, that bursts the closest, strongest chain—

with the lines written by Elizabeth some years later in reference to her unfortunate cousin:

> No forreine bannisht wight shall ancre in this port,
> Our realme it brookes no stranger's force, let them
> elsewhere resort!

There is, in fact, scarcely a page of this book that does not suggest some reflection on the contrarieties of human fate and character.

In "The Seven Ages of Washington" (The Macmillan Co.), Owen Wister joins the long line of writers who have tried a hand at relating the life of the Father of his Country. From the charming absurdities of Parson Weems, and the unreadable four volumes of Marshall, through the delightful pages of Irving, and Henry Cabot Lodge's excellent biographical sketch—to say nothing of the inevitable "True George Washington"—from Jared Sparks to Worthington C. Ford, the accumulation of material is large enough to overwhelm the reader who courts the avalanche. This last contribution is a clever outline of the "Old Fox" of the Revolution, and the first President of the United States, with not a hint of dulness about it. At some points extravagant in expression, and at others exhibiting perhaps not the best of taste, this book presents a picture of the great man that is clearcut and on the whole true. Unpretentious, the volume is of just about the value that the author meant it should possess. There is, of course, little that is new. The extracts from Washington's letters are skilfully selected.

Frederick Trevor Hill's "Decisive Battles of the Law" (Harper & Bros.), narratives of eight famous legal contests in American history, should appeal to a large class of readers who have neither time nor inclination to consult historical monographs, but who are nevertheless not satisfied to take their history from historical novels. Constitutional and legal history does not lend itself readily to the popularizing process, and it is therefore less familiar even to the generally well informed than the story of wars or politics. When a writer who knows both law and history, and who in addition has the gift of telling an interesting story, enters this comparatively untilled field, he is to be encouraged. To be sure, Mr. Hill's narratives, published originally as magazine articles, are all concerned with subjects that have dramatic or political interest, aside from their importance in the development of American constitutional law. Nevertheless, it is with the acts of Aaron Burr and John Brown rather than with the details of their trials that we are most familiar; it is with the purport and influence of the Dred Scott decision that we are ordinarily concerned, not with the course of the intricate litigation which has never been so fully and clearly told as Mr. Hill tells it. The course of the Alabama arbitration, Andrew Johnson's impeachment, and the work of the Electoral Commission are better known. All these, together with the trial of Callender under the Sedition Act and that of the Chicago anarchists the author has described with a full appreciation of dramatic possibilities, but with a strict adherence to facts, and a clear setting forth of the legal points. It cannot be said that Mr. Hill has always shown judicial impartiality, but what partisan bias has crept in may be attributed to the fact that he is more of an advocate than an historian.

"Women's Work and Wages," by Edward Cadbury, Cécile Matheson, and George Shaun (The University of Chicago Press), is an American edition of an English work already favorably known to many readers. It embodies the result of first-hand investigation of a problem of national importance, and may well serve as a model for similar studies in the United States. As the American editor remarks:

> If for "shillings" and "pence" were substituted "dollars" and "cents," and if some of the English trade terms were translated into their American equivalents, several chapters of the . . . study might apply to New York, Boston, or Chicago.

Upon such topics as women's wages and the effect of the employment of married women upon the home, the views of the authors are entitled to most careful consideration.

Miss Isabella T. Redfield has published a small volume of outline studies on the Acts of the Apostles and the Epistles, which is well fitted to be a manual for Bible classes or for private study of the history and religious life of the apostolic age. The analysis of the Biblical material is good, the coördination of references to the historical work and the Epistles shows careful study, and the questions for the student are designed to call out independent thought and appreciation of the real problems of the period. The book is privately printed by the author at Pittsfield, Mass.

The American Unitarian Association has in preparation a Centenary Edition of the works of Theodore Parker, which as a standard edition will doubtless take the place of the twelve volumes edited nearly fifty years ago by F. P. Cobbe. The volumes which have already appeared are convenient and serviceable, and are well edited. Col. Thomas Wentworth Higginson has prepared the new edition of Parker's best-known work, the "Discourse of Matters Pertaining to Religion." In the volume "The American Scholar" a number of literary and critical papers are collected, and "The World of Matter and the Spirit of Man" contains a number of sermons and religious discussions not heretofore included in any edition of Parker. George Willis Cooke is the editor of the latter volumes. The completion of the series will furnish opportunity for a review of Parker and his influence.

Dan Fellows Platt, the author of "Through Italy with a Camera" (G. P. Putnam's Sons), is an enthusiastic and intelligent traveller who writes an easy narrative of a pleasant journey. He enjoys scenery, buildings, and pictures, and takes the vicissitudes of the trip with wholesome good nature. His itinerary covers not only the well-beaten roads, but many byways—from Castelfranco and San Daniele in the north to San Galgano, Montefalco, and Jesi in the centre. Most remarkable are his illustrations, which have three merits—they are very numerous, more than 200 in all; they are uncommonly well done; and they include many out-of-the-way scenes and bits of native life and costume. After one has read the letter-press, these half-tones will serve as a sort of album of Italian subjects, to be returned to again and again.

Among the strictly philological papers in the Transactions of the American Philological Association for 1906 (Ginn & Co.), Prof. E. Washburn Hopkins's "Reconsideration of the Vedic Dative" deserves special attention from classical scholars by its illustrations of an undoubted original *directive* force in the Sanskrit dative, extending into a dative of Interest. The many happy parallels in Greek, Latin, Old English, and German are peculiarly instructive and suggestive. Articles of particular value on the historical and literary side are Prof. Bernadotte Perrin's research into the growth of the Plutarch legend of the death of Alcibiades, and Dr. R. G. Kent's neat summary of the Question of the Time Element in the Greek Drama. Prof. Augustus T. Murray comes to the not unexpected conclusion that Theocritus painted from the actual life of Sicilian herdsmen, and that most of the bucolic pieces were written before he left Sicily.

In "The Brahmans, Theists, and Muslims of India" (Philadelphia: G. W. Jacobs), John Campbell Oman, formerly professor of natural sciences in the Government College, Lahore, has strung together a number of papers of varied value. The many pages devoted to subjects already treated by other writers, such as caste and the history of Hindu theism, are not of great worth, and give the impression of having been taken in great measure from previous authors. On the other hand, Mr. Oman's own observations and studies from life in India, his descriptions of the Holi festival and the Mohammedan fakirs deserve a permanent form. It is, in short, a pity that this book was not pruned to the quick and published as a pamphlet instead of a stout volume of over 300 pages, much of which is old matter in a form not particularly attractive.

Walter Crane's pictures (sketches and color) in his "India Impressions" (The Macmillan Co.) are, of course, the chief if not only reason for the existence of his book, which, as he says with studied *naïveté*, consists otherwise merely of "a few notes and fresh impressions from an artist's point of view." The work is, in short, without sufficient excuse for being, but having been written does no harm. At any rate the pen-and-ink sketches are new, and some of them are funny.

Among recent books on India two are of unusual value, the "Outlines of Mahāyāna Buddhism," by Prof. D. T. Suzuki (London: Luzac & Co.), and "Medicine of Ancient India," by Dr. A. F. Rudolf Hoernle, Part I. (Henry Frowde). For some time both works have been eagerly looked for by Sanskrit scholars. Professor Suzuki's aim has been to instruct Western critics concerning the "Great Vehicle" of Buddhism and to interest scholars of comparative religion. There is much that the East can teach the West in regard to the religious atmosphere, the *nuance* of meaning more felt than uttered in the holy words; and we welcome all useful suggestions in interpretation. For the general student of philosophy Professor Suzuki's book will prove a valuable guide in that special branch of Buddhism least appreciated in the West. Dr. Hoernle's treatise on Hindu medicine is too technical to tempt any one save a Sanskritist or a surgeon of inquiring mind (the First Part of his work is devoted exclusively to osteology) to enter the maze of detail presented by the author. But as part of a general history of the subject this book is of prime importance. It discloses a surprising amount of anatomical knowledge current in India five or six centuries before Christ, and suggests the query (which cannot yet be answered) whether Greek physicians borrowed much from India, when they visited that country in the fourth century before Christ.

Another book deserving honorable mention for the labor it has entailed is the sixth and final volume of the translations of the Jātakas (G. P. Putnam's Sons), begun by the late Prof. E. B. Cowell and concluded by Dr. W. H. D. Rouse, who has translated all the even numbers of this series. The work has already been noticed in the *Nation*. It is enough to say that the present volume is on a par with its predecessors and to congratulate the editor on the happy completion of an undertaking begun a dozen years ago.

A new association, organized with headquarters in Brussels for the study of Romance dialects, will publish in that city two journals: *Revue de dialectologie romane* and *Bulletin de dialectologie romane.* The editors will be Profs. Carlo Salvioni of the University of Milan for Italy, Louis Gauchat of Bern for Switzerland, Gilliérou of Paris for France, Menendez Pidal for Spain, A. Rivard for Canada, Ovid Densusianu of Bucharest for Rumania, and Wilhelm Meyer-Lübke of Vienna for Austria. The general secretary is Prof. Bernhard Schaedel of the University of Halle.

With the current year the Verlag für Literatur, Kunst und Musik, in Leipzig, has begun the publication of a new literary monthly of an ambitious character, called *Xenien.* Each issue contains at least 64 pages, to cost 4 marks per annum.

The house of H. Schmidt & C. Günther, Leipzig, following the precedent of some publishers in England, is issuing German classics in a so-called Liliput-Bibliothek, beautifully printed, and in actual vest-pocket size. A beginning has been made with Goethe's "Faust" and Heine's "Buch der Lieder," each volume a mark and a half. Several other works of Goethe, as also of Schiller and Lessing, are included in the list, either just leaving the press or in preparation.

A new edition of Schelling's works, appearing in three volumes, comprising more than 2,300 pages, is just coming from the presses of Fritz Eckhardt, of Leipzig, as the first instalment of a new series called Die Werke der klassischen deutschen Philosophie. There is an introduction by Prof. Arthur Drews. The publishers declare that this series is being issued in response to the revival of interest in psychological and metaphysical studies.

The "Russisches Encyklopädisches Lexikon," which has been in process of publication for years by F. A. Brockhaus, Leipzig, in conjunction with J. A. Efrou of St. Petersburg, has now been brought to a conclusion by the issue of the last supplementary volume in the set of forty-three volumes. The first appeared in 1890, and the last of the "Lexicon" proper in 1904; the supplements cover events down to the middle of 1907. A leading feature of this latest volume is an account of the Japanese war. In order to make the contents of this storehouse more readily accessible, the same firm has published a "Kleines Encyklopädisches Lexikon" in three volumes.

The Catholic encyclopædia, known as "Herder's Konversations-Lexikon," which since 1902 has been appearing in its third revised edition (Freiburg im B.: Herder), has just been completed by the publication of the eighth volume. The work is richly illustrated, this last volume having in the text 430 illustrations and the Beilagen 670 more.

The next annual meeting of the American Jewish Historical Society will be held in this city May 3. The proposition to enlarge the scope of the society, so as to embrace general Jewish history, and not merely American Jewish history, submitted at the Baltimore annual meeting two years ago, and discussed last summer at the Newport meeting, will be acted upon by the society. Volume XVI. of the society's publications has just been issued, and the work of indexing American Jewish periodicals, undertaken by the society, is progressing.

A second circular has been issued in reference to the Fifteenth International Congress of Orientalists (see *Nation* of July 11, 1907, p. 33), fixing the time and place, August 14 to 20, Copenhagen. Several governments. including our own, have decided to send special delegates; those selected from this country are Profs. Paul Haupt of Johns Hopkins, Charles R. Lanman of Harvard, Morris Jastrow, jr., of the University of Pennsylvania, and A. V. W. Jackson of Columbia. A large number of scientific institutions and universities in this country and Europe have also already appointed delegates; and the Congress gives promise of outstripping its predecessors in point of attendance.

Louise de la Ramée, better known by her pen-name, "Ouida," died at Viareggio, Italy, January 25. She was born in England in 1840, and at an early age began to write stories. Her first novel, "Granville de Vigne," was published in *Colburn's New Monthly,* in 1860, and issued in book form in 1863 under the title "Held in Bondage." She was the author of forty or more books, among them: "Strathmore," 1865; "Chandos," 1866; "Under Two Flags," 1867; "Idalia," 1867, "Tricotrin," 1869; "Puck," 1870; "Tolle-Farine," 1871; "A Dog of Flanders," 1872; "Pascarel," 1873; "Two Little Wooden Shoes," 1874; "Signa," 1875; "In a Winter City," 1876; "The Story of a Dream," 1877; "Friendship," 1878; "Moths," 1880; "A Village Commune," 1881; "In Maremma," 1882; "Bimbi," stories for children, 1882; "Dramatic Sketches," 1883; "Wanda," 1883; "Pipistrello and Other Stories," 1884; "Princess Napraxine," 1884; "A Rainy June," 1885; "Othmar," 1885; "Don Gesualdo," 1886; "A House Party," 1887; "Guilderoy," 1889; "Ruffino," 1890; "Syrlin," 1890; "The Tower of Taddeo," 1890; "Santa Barbara, 1891; "The New Priesthood," 1893; "The Silver Christ," 1894; "Two Offenders," 1894; "Le Selve," 1896; "The Massarenes," 1897; "Toxin, an Altruist," 1897; "La Strega," 1899; "The Waters of Edera," 1900; "Critical Studies," 1900; and "Street Dust," 1901. Several of her novels have been dramatized, notably "Under Two Flags" and "Moths." She was entirely without judgment in money matters. and, as a result, died in extreme poverty. One of her marked traits was a passionate love of animals, especially dogs.

The death is announced of Robert Atkinson, president of the Royal Irish Academy, professor of Sanskrit since 1871, and of Romance languages since 1867 at Dublin University. He was a man of extraordinary gifts as a linguist. He is said to have taught successfully Sanskrit, Tamil, Telegu, and most of the Romance tongues; to have been versed in Russian, Coptic, and mediæval Irish; and also to have been a student of Chinese. He edited the "Vie de St. Auban," 1876; "The Book of Leinster," 1880; "The Book of Ballymote," 1887; the Passions and Homilies from Leabhar Breac; "The Yellow Book of Lecan," 1896; the Irish Text in the "Liber Hymnorum," 1898 (for the Henry Bradshaw Society); and two volumes of the Brehon Laws. He also wrote "On the Use of the Subjunctive Mood in Welsh," 1894; and "On the Function of the Subjunctive Mood in Irish," 1894.

Walter M. Ferriss, for many years a contributor to the *Nation,* died January 21 at Bay Ridge, Long Island, in the eighty-third year of his age. He was born in Charlotte, Vt., and was graduated from Union College. At first he tried his hand at the law, but soon he devoted himself wholly to scholarship, especially in the field of classical philology. His contributions to the *Nation* were chiefly reviews of classical and mathematical works. His principal literary work was done for Appleton's "American Encyclopædia," "The American Supplement to the Encyclopædia Britannica," "The Century Dictionary," and "Webster's International Dictionary."

The Rev. John Alexis Edgren died at Oakland, Cal., January 27. He was born in Sweden in 1839, was graduated from the Navigation School, Stockholm, and, coming to America in 1862, served in the navy during the civil war. After studying theology at Princeton and Chicago he was ordained to the ministry. He was professor in the Baptist Union Theological Seminary, Chicago, and principal of the Swedish-American Bible Seminary, St. Paul, and of the Central Bible Seminary, Stromsburg, Neb. He was author of "Epiphaneia," 1881; of numerous works on theological and Biblical subjects in Swedish; and of a translation, with exposition, of the Gospel of Matthew.

Allesandro Gherardi, director of the State Archives at Florence, died January 8, in his sixty-fifth year. A profound student and an indefatigable helper of others, he had spent forty-five years of his life among the parchments of the Uffizi. Among his numerous publications we may cite only the "Diario di Anonimo Fiorentino," an account of the popular uprising of the thirteenth century by an eyewitness; and the two important volumes "Consulte della Repubblica." Out of hours his recreation was to investigate and arrange the archives of historic families. Thus he was recently engaged in sifting the papers of the Guicciardini with a view to a new edition of the "Storia d'Italia," of which a considerable part is in the press.

THE VICTORIA HISTORY.

The Victoria History of the Counties of England. Edited by William Page, Bedford, Vol. I.; Berkshire, Vols. I., II.; Bucks, I.; Cornwall, I.; Cumberland, I., II.; Derby, I.; Devonshire, I.; Durham, I.; Essex, I., II.; Hampshire, I., II.; Hertford, I.; Lancaster, I., III.; Lincoln, II.; Norfolk, I., II.; Northampton, I., II.; Nottingham, I.; Somerset, I.; Suffolk, II.; Surrey, I., II.; Sussex, I.; Warwick, I.; Worcester, I., II.; York, I. Hertfordshire Families, Northamptonshire Families, one vol. each. London: Archibald Constable & Co.; New York: E. P. Dutton & Co. 1901-1907.

In these days of luxurious book-making and of organized coöperative effort in the production of historical works, no series of volumes is more conspicuous for its size, trustworthiness, and typographical beauty than this "Victoria History of the Counties of England." Designed to include all the counties of England in a national historic survey, under the direction of the foremost students of that country in science, history, and archæology, it will reach eventually the enormous number of 173 royal quarto volumes of historical matter and 40 folio volumes of genealogy and family history. Thus far, 32 volumes for 23 counties, with 2 volumes of genealogy, have been issued, and publication will continue as rapidly as material can be prepared. The histories of individual counties may be subscribed for separately. The historical volumes average a guinea and a half in price, the genealogical volumes reaching five guineas, so that the historical volumes alone, exclusive of London, will cost £252, or more than $1,200. For value received the price is eminently reasonable; even the 32 volumes thus far issued make an imposing appearance upon the shelves, and in absolute merit the contents fully match the resplendent exterior.

In the words of the general advertisement the history is designed to trace

> the story of England's growth from its prehistoric condition through the barbarous age, the settlement of alien peoples, and the gradual welding of many races into a nation which is now the greatest on the globe. All the phases of ecclesiastical history; the changes of land tenure; the records of historic and local families; the history of the social life and sports of the villages and towns; the development of art, science, manufactures, and industries—all these factors which tell of the progress of England from primitive beginnings to large and successful empire, will find a place in the work and their treatment be entrusted to those who have made a special study of them.

Though in the yet unfinished state of the history it is not possible to say how completely this elaborate programme will be carried out, yet if we may judge from the instalments before us, the plan is in the way of complete fulfilment. For the sectional editors no better men could have been chosen than Bowd-Dawkins and Canon Greenwell on prehistoric remains; G. Laurence Gomme on ethnography; Prof. Joseph Wright on dialect; Round, Reichel, Haltzmann, and Ragg on Domesday Book and similar documents; St. John Hope on architecture; Cox on forestry; Stevenson, Round, Tait, Tout, and Firth on political history; Leach on schools; Laughton on maritime history; Round and Oswald Barron on feudal genealogy and blazonry; and others of equal reputation in their respective subjects. Rarely, if ever, has an enterprise of this kind enlisted the active coöperation of so large a number of trained specialists. Three characteristics impress themselves upon the reader of these volumes and stamp the work with a special hall-mark of excellence: the broad interpretation which the editor has placed upon the word "history," the scholarly nature of the contributions, which are in no way designed to be merely popular in character, and the liberality with which the publishers have furnished accessory matter in the form of maps, charts, plans, and illustrations.

The opening chapters of each separate history are devoted to geology, paleontology, botany, and zoölogy. In a few instances brief chapters are given on climate. The chapters on all these subjects are in every instance scientific treatises, bristling with learned details, names, and lists, always valuable, but sometimes intelligible only to an expert. Much that is said here of geology and botany is exceedingly instructive, but the elaborate double-column lists of birds, flowers, etc., often unaccompanied by their popular equivalents, seem rather technical in character. Few illustrations will be found in these chapters, but the maps, geological, orographical, and botanical, extending in the case of the geological map of Yorkshire to five double-page sections, are particularly fine.

The second group of chapters concerns early man, Roman-British remains, Anglo-Saxon remains, and ancient earthworks. In only about a third of the volumes have chapters on Romano-British archæology been printed, owing to the desire of the publishers that Dr. Haverfield, the ablest living authority upon this subject, shall contribute as many of the articles as possible. The portions relating to ancient earthworks, in which no attempt has been made to classify the remains according to periods or to the race by whom they were constructed, are likewise few in number and frequently inserted out of their proper order. As far as the general reader is concerned, no chapters are more important than these admirable contributions. Written by scholars of the highest authority they will constitute, when completed, an absorbing and valuable record of man's existence on British soil from prehistoric times to the coming of William the Conqueror. The chapters on early man tell us of the neolithic remains in York and Surrey, the paleolithic remains in the sands of Bedford and the limestone cavities of Derby, remains of cave men in Somerset and Bucks; the lake villages of Somerset, Northampton, and Berkshire; the protected village of Grimspound; the tors, cromlechs, menhirs, quoits, dolmens, and stone circles of the southwest; and the manifold evidences of man's handiwork in pottery, stone, and metal dishes, querns, swords, spears, brooches, and coins, the latter described by that expert numismatist, Sir John Evans. We have also descriptions of those gigantic hillside figures, of which the most noteworthy is the White Horse of Berkshire, the old time scouring of which is described in the section relating to the sports of that county.

Of even greater value than the chapters devoted to early man are those, nine only, descriptive of Romano-British archæology. Dr. Haverfield's share alone would fill a volume of more than five hundred pages, superbly illustrated. Not only do Haverfield's contributions contain minute and learned accounts of the Roman ruins at Bath, in Norfolk, Northampton, Hampshire, Worcester, Warwick, and Derby (the account of Silchester is by another hand, and that of Verulanium is deferred), but they also give us disquisitions of exceptional value upon Romano-British life, customs, and organization both military and administrative, and furnish the ablest exposition of Roman influence in Britain that has ever been published. The chapters on Saxon remains are written chiefly by Reginald A. Smith. The article by Dean Kitchin upon the contents of the shrine of St. Cuthbert is deserving of special mention.

Of all the features of these volumes none is more noteworthy than the treatment of Domesday Book and other similar documents of the period. A translation with introduction, notes, and maps is printed in full of all these indispensable sources of early county history. The supplemental texts thus far included are the Boldon Book for Durham, edited and translated by Dr. Gaillard Lapsley, our American representative at the English Cambridge; surveys of Worcester, Winchester, and Northampton; the Exon Domesday for Somerset and Devon; the Testa de Neville and extracts from the Pipe Rolls for Cumberland. When it is said that Mr. Round has written the introduction to eleven county Domesdays, has himself translated some of the texts and contributed notes to all of them, and has prepared all the Domesday maps, we know what to expect. His introduction and translation of the Essex Domesday, one of the three texts which make up the "Little Domesday," reaches 265 pages. The long and difficult Domesday text relating to Norfolk, also in the "Little Domesday" volume, was entrusted to the expert hands of Messrs. Johnson and Salisbury of the Public Record Office, and printed in the second volume relating to that county. Our only regret is that these invaluable chapters are not available for the use of students in compact form and at a cheaper price.

The second volumes generally open with essays on ecclesiastical history and long double-column accounts of the religious houses. In a few cases, Bedford, for example, these articles appear in the first volume. Similarly in the second volumes, though with many exceptions to the rule, will be found the chapters on political, maritime, military, social, and economic history, agriculture, industry, forests, sports, schools, and architecture; and an occasional chapter on monumental effigies, early Christian art, and mediæval painting. The essays on political and ecclesiastical history have but little general interest, dealing as they do chiefly with county affairs and personages; yet witness must be borne to the painstaking character of the work and to the solid documentary foundation upon which the authors have based their conclusions. The chapters on schools, written mainly by A. F. Leach, though most meritorious as guides to the history of English education, are hardly readable. An exception to this general statement may be taken in the case of the hundred pages devoted to Winchester College and the Wykhamites. The chapters on forestry and the forest laws by the Rev. J. C. Cox are valuable contributions to that important subject; those by J. Nisbet, with the exception of the article on the New Forest, are less satisfactory. Standing in a class by themselves and conspicuous for their length and the amount of research involved, are the sections on the monastic and other religious foundations. The material to be digested before these articles could be written was enormous. Local records of all kinds, chartularies, registers, rolls, and patents in the London archives—all have been put under requisition, and it is worth noting that many of those who have performed this arduous labor are women, graduates of the Honours School at Oxford and students at the London School of Economics. Differing from these sections in nearly all respects, save that of occupying double columns of fine type, are the chapters relating to industries and to ancient and modern sports. These sections are generally accompanied by illustrations—

portraits and reproductions of paintings and engravings.

On social and economic history but four essays have been printed. These, however, are of high merit, though Mr. Massingberd's paper for Lincoln and Miss Lees's paper for Oxford are superior to that of Miss McMunn for Essex. Miss Lodge's valuable paper for Berkshire has had the great advantage of Professor Vinogradoff's supervision, and is an admirable piece of work. These essays deal with the history of villeinage, agricultural life, manors, towns, fairs, tenures, open fields, payments, services, rents, prices and wages, local government and administration, seignorial courts and royal justice, and carry the subject through the changes of the fourteenth, fifteenth, and sixteenth centuries, down to the present time, closing with elaborate statistical tables which show the population from 1801 to 1901. Miss Lees lays special stress upon the growth of pauperism and vagrancy, the influence of the monasteries, and the working of the poor laws, tracing these topics to the labor movement inaugurated by Joseph Arch in 1872. The essay treating of mediæval painting in Norfolk, an epitome of the art as it was practised through the Middle Ages, discusses pictorial representations of events in sacred history, of legends of the saints, of sacred allegories, and decorative ornamentation of various kinds in the churches. This chapter contains many beautiful illustrations, some of which are in colors.

Thus far the chapters without exception deal with each county as a whole, but from this point on it is designed to treat separately the local divisions—hundreds, ridings, and liberties—and to trace their history, parish by parish, manor by manor, town by town. These sections, classed under the general head of "topography," begin wherever the general chapters come to an end, and will occupy the remaining volumes for each county. They are accompanied by outline plans of all the hundreds, by plans of each individual hundred, and by general county maps, often of many sections in colors, that of Hampshire covering six double pages, which present the local divisions with a minuteness unequalled anywhere except in the ordnance maps of the British government. At present only four portions, relating to parts of Notts, Worcester, Lancaster, and Hampshire, have been printed. The amount of space set apart for the presentation of this phase of the subject can be inferred when we say that nearly two hundred pages are devoted to the soke of Peterborough and one of the 22 hundreds of Northampton, 82 pages to the smallest of the 5 hundreds of Worcester, and an entire volume to but part of one of the 6 hundreds of Lancaster. One stands amazed at the vastness of this undertaking, and the wonder grows as one notes the thoroughness with which the contributors have performed their task. The amount of research required for the production of these chapters must have been prodigious, as is evident from the number and variety of the footnotes; and the labor expended can only be appreciated by those who have tried their hands at working out the history of a single parish. Conspicuous among many notable features are the description of Speke Hall, near Liverpool, the account of the borough of Peterborough by the late Miss Mary Bateson, and the history of the important monastic town of Evesham by an American scholar, Dr. N. M. Trenholme, who has spent much time in England investigating the subject of English monastic boroughs.

Of the supplemental, or pedigree, volumes, we have but little space to speak here. They include the family history and detailed genealogy of such houses as had at the end of the nineteenth century seats and landed estates which had been enjoyed in the male line since October 25, 1760, the date of the accession of George III. The reasons for the selection of this particular date, which parts the older from the newer houses, are stated at length in the general introduction to the Northamptonshire volume. Both of the volumes thus far published are filled with portraits, beautifully reproduced, heraldic designs in great profusion, done in black and white and in colors, and genealogical tables most elaborately worked out. These volumes are models of exquisite typography and good taste.

In conclusion, a few general comments may be made. The "Victoria History" owes its origin in large part to the inadequacy and scarcity of existing histories of the counties of England. It has been rendered possible by the rapid advances which have been made during the last quarter of a century in the scientific study of local and national records, and in the accessibility of increasing quantities of record material. Its great value will lie not only in the wealth of detail which it furnishes, but also in the fact that all this information has been gathered under the guidance of a single general editor, aided by an advisory council of the ablest men in England. When to this unity of plan and action be added the coöperation of a public-spirited publishing house, possessing sufficient faith in the enterprise to give it substantial financial support, and the unwearying devotion of scores of writers, actuated by high scholarly ideals and ambitious to make their contributions thorough, trustworthy, and impartial, we have the chief reasons why this notable history will hold permanent place among the most conspicuous literary and publishing ventures of the early twentieth century.

CURRENT FICTION.

The Welding. By Lafayette McLaws. Boston: Little, Brown & Co.

This romance, dealing with the conflict of South and North, makes the admission, on its last page, that "there is little more to tell, for the whole of Richmond County knows how the breach was healed between Margaret and Jack, and how they were married in Rosney Chapel, with David and Dorothy, on the first day of June after Appomattox." One asks, Why this sudden reserve on the writer's part? Are those of us who live beyond the borders of Richmond County always to be kept in ignorance? It looks like discrimination. The critic reluctantly points to one loose strand in a conscientiously fabricated plot. On the discovery that his foundling sweetheart is about to be proclaimed an heiress, David Hamilton, whose own parents were ignoble and poor, writes her, without explanation, that the marriage cannot be. This act of renunciation is intended to save her the pain of telling him of the social gulf that has yawned between them; but, oddly enough, Dorothy believes herself deserted, and is sadly put out. Only after many and great vicissitudes does the real motive of David's act transpire, and true love, faithful through all, receive its reward. Hamilton is a Southerner. The story of his starveling boyhood gives the author ample opportunity to describe ante-bellum conditions, social and political, in the South; the story of his youth, as page at the national Capitol, offers occasion for many an historic portrait and epitomized speech; finally, his years in the Confederate service acquaint the reader with the course of several great battles. This is very conscientious fiction.

A Prophet in Babylon. By W. J. Dawson. New York: Fleming H. Revell Co.

Mr. Dawson has made himself known as author of a series of volumes on modern English writers, and of several books dealing with matters of religious inquiry. He now makes a serious attempt to express in the form of fiction the upshot of his speculations as to the connection between religion and modern life. He has created no human beings; his figures are as baldly impersonal as those of allegory. But like the puppets of allegory they suggest real types, as their behavior suggests actual tendencies of the day. The problem is the old one—the contrast between the theory of Christianity and its practice in the so-called Christian community. The well-known pulpit-orator of a fashionable New York church finds himself, at the end of a seven years' incumbency, to be losing ground with his audience. The fact is brought home to him suddenly that he is a mere "seller of rhetoric." His deacons no longer regard him as a paying investment, and the question of cutting down his salary is broached, as a means of getting rid of him. He counters, and for the moment restores his self-esteem, by giving up his salary altogether. But his conscience has been awakened, and he begins to see more and more clearly the hollowness and selfishness of the Christian fellowship, as it is called, in which he and his exclusive parishioners have indulged. When he tells them flatly from the pulpit that his religion and theirs has been a "sorry travesty," "only a gratification, never a sacrifice," he is met, for the most part, with indignation and distrust. He has an impulse to go out among the publicans and sinners, and to suffer for them. He knows nothing of actual conditions. "Why, it's overwhelming!" he exclaims, when a fellow-clergyman leads him into the slums. "Is no one doing anything for them socially or religiously?" Yes, responds his mentor:

> There are lots of little societies of good people who come down from time to time, and squirt a little rosewater over this fetid mass of life, and come back with a fine report that the wilderness has really blossomed as the rose.

Meantime, society as a whole does nothing to prevent the conditions under which these thousands live. Yet, pursues the guide, Americans are "a race of idealists," who "adore the dollar for want of something better to adore."

Inspired by these (to him) novel ideas, our reformed orator determines to abandon all connection with the Church, and to found outright and, as it were, incontinent, a new association of mankind which is to displace all others—"The League of Service." A meeting is called in Madison Square Garden, thousands are enrolled, and the world-movement is begun. "You're to pay a dollar and love everybody!" is the information given by one of the members to an inquirer. "A fellowship of all who love in the service of all who suffer," is the founder's own definition. The league is, it further appears, to work for personal, social, and civic virtue. It is not only to heal the sick, but to cast the money-changers out of the temple. It is, in short, to be a really Christian force in human society. "An Ideal had entered the world," says the author, somewhat strangely. For the ideal is at least eighteen centuries old; though never, alas, save in fiction has it been realized in what we call Christendom. It is easy for the novelist to assert what ought to be for what is; but thus far Western civilization can produce little evidence against such calm statements of fact as that of our "Chinese Official" of the other day:

> It is the Nemesis of an idealist creed that it cannot inform realities; it can but mass together outside and in opposition to the established order the forces that should have shaped and controlled it from within. The spirit remains unembodied, the body uninformed.

Mr. Dawson's "League of Service" is animated by no new ideal—informed with no new spirit; it simply has the advantage of dealing with a new kind of human nature; a new race.

The Spinners' Book of Fiction. By Gertrude Atherton, Mary Austin, Geraldine Bonner, Mary Halleck Foote, Eleanor Gates, James Hopper, Jack London, Bailey Millard, Miriam Michelson, W. C. Morrow, Frank Norris, Henry Milner Rideout, Charles Warren Stoddard, Isobel Strong, Richard Walton Tully, and Herman Whitaker. Collected by the Book Committee of the Spinners' Club. San Francisco and New York: Paul Elder & Co.

This volume of stories has been put together to make a fund, primarily for Miss Ina Donna Coolbrith, known as one of San Francisco's literary pioneers, whom the 18th of April, 1906, left "bereft of all literary and other treasures." Following her needs, it is intended that the fund shall "serve to aid some other writer, artist, or musician whose fortunes are at the ebb." In such affairs it is customary for criticism to step aside and make place for eulogy. But in the present case criticism takes pleasure in going hand in hand with eulogy in calling attention to a sheaf of fiction worth the garnering. Of the sixteen stories either here first given or reprinted, only one is shapelessly poor, and at least eleven are very good. For the most part the tales lie far to the West, modern truly, yet refreshing in a return to early types of Pacific literature, full of pictorial quality, of snow and sunshine. There is a reviving absence alike of railroads, stock markets, and problems, showing that in the hands of artists human nature and fresh air may be relied on to supply adequate comedy and tragedy. Painters and designers have lent their aid in illustration and decoration, and George Sterling contributes introductory verses full of music and poetry.

The Halo. By Bettina von Hutten. New York: Dodd, Mead & Co.

Upon ascertaining that the title has reference to the luxuriant, halo-like hair of Victor Joyselle, the foremost violinist of his time, the reader will not expect a narrative of the trials and triumphs of saints. Lady Brigit Mead is engaged to the son, young Théo Joyselle, but she is in love with the father. The great virtuoso struggles against his passion, partly for the sake of his wife, a simple Norman peasant woman, for whom he has a sincere, if tolerant, affection, and partly for the sake of Théo, whom he longs to see well-married; but his resistance becomes less and less vigorous, and plans are finally laid for an elopement. That they are not carried out is due to the sudden death of Félicité, Victor's wife, only a few hours before the appointed time. Victor, desperate with remorse, seems to have partly lost his mind, as he stands there by his wife's bed, unregardful of Brigit, who has brought flowers. Here the story incontinently breaks off, leaving the reader to expect—or fear—a sequel.

The familiar personages of a cheap society novel are all present in "The Halo," and furnish the requisite amount of dull and vulgar talk. It is not easy to explain the voracity of an apparently large body of readers for this trite spectacle of fat dowagers, drunken lords, vapid and bedizened ladies—a company in which not one is even tolerably clever or entertainingly naughty. Brigit herself, "strangely and undeniably beautiful" though she may have been, possesses few amiable traits. There is much in the novels of Bettina von Hutten that expresses the noisy revolt of a middle-class soul against the restraint of conventional morals. It may be that in this fact lies the secret of their popularity.

Fiji and Its Possibilities. By Beatrice Grimshaw; illustrated from photographs. New York: Doubleday, Page & Co. $3 net.

A wanderer about odd corners of the globe is Miss Grimshaw's apt description of herself, a description to whose truthfulness her book bears abundant evidence. She was, in fact, the first white woman to visit certain parts of the Fijis in carrying out her purpose to "see just what the native and his life were like, and of what value the country still might be to possible settlers." These places were in the interior of the two largest islands of the group; and from her account it appears that, though rich in natural resources, valuable timber, land suited for the cultivation of sugar, tea, coffee, vanilla, and bananas, and for stock-raising, and with a "splendidly healthy climate," both islands are, with the exception of a narrow strip along the shore, absolutely undeveloped. The principal reason is the lack of labor, money being of no value to the Fijian.

The latter half of the book is devoted to a narrative of similar journeys in the New Hebrides, and it is to be regretted that this fact should have been omitted from the title-page of the American edition*, as the information about this region is far more interesting and important than that about the better-known group. The peculiar joint protectorate which France and England maintain over the islands is clearly explained, the resulting condition being that they are "in the most uncomfortable and unsettled state it is possible to conceive." Their civilization and progress is "entirely blocked by the absence of all real authority over the natives." The missionaries in sixty years of self-denying labor have only been able to form the "merest fringe" of Christianity "about an impenetrable mass of utter barbarism." The one remedy is a "strong and able government, which could forbid the sale of poisonous spirits to the natives, disarm the tribes, compel the traders to cease selling rifles and ammunition, and impartially punish all offenders, white or black." At the time of her visit, in 1905, if a native murdered a white man the redress "was usually applied by the next man-of-war that happened to come along. If a white man injured another in any way, there was no legal redress at all." It is encouraging to be able to say here that at an Anglo-French convention, held in London in 1906, measures were adopted for the prohibition of the sale of arms and liquor to the natives, for the reorganization of the administration and the establishment of a police force, but the vital question as to which power should control the islands was left unsettled.

The author made several trips into the interior of two of the islands and, regarding the life and customs of the natives, she gives most interesting details, some of which are a problem for the ethnologist. For instance, the island of Mallicolo, which she prefers to spell Malekula, is "honeycombed with caste superstitions, and no man will touch food prepared at a fire used for cooking that of any other caste." An idol mask, of which a photograph is reproduced, represents a perfect Mephistophelian face, and the natural query is whence the idea was obtained. She thus describes a young chief of some importance: "He had a head like a black feather mop, adorned with a big green parrot-tail; his lips occupied half his face, and his skull was shaped like an egg. He was handsomely dressed in elbow-deep cuffs of solid tortoise-shell, a trade cartridge-belt, a boar's tusk worn locketwise on his breast, and a pig's tail in each ear. On his shoulder he carried a large black pig—alive—and with this singular cotillon favor he began gravely" to dance. During this part of her travels the author was the correspondent of a colonial newspaper, and, indeed, her whole book reads as if made up of letters. She tires the reader by repetitions, long digressions, feebly humorous passages, frequent allusions to cannibalism, and prolix accounts of trivial and uninteresting incidents. Her book would have been far more readable had she confined herself to descriptions of the country and the natives.

The work is sumptuously got up, being the last volume of the Geographical Library. The numerous excellent photographs, which really illustrate the text, include some of Norfolk Island, of which there is a brief account in the closing chapter.

---

*The title of the English edition is "From Fiji to the Cannibal Islands."

Railway Corporations as Public Servants. By Henry S. Haines. Pp. 233. New York: The Macmillan Co. $1.50 net.

This volume makes no claim to originality of theme or treatment. Like the preceding work by the same author, "Restrictive Railway Legislation," the book is a series of lectures delivered before the Boston University School of Law. The limitations attending such a presentation have prevented anything more than a broad handling of the subject, and therefore detailed criticism of the treatise would be beside the point.

The author's wide experience in railway affairs and his acquaintance with the theoretical side reveal themselves in a clear statement of the development of common carrier service, and of American railway regulation. We note only two errors of fact: one, that the amended Interstate Commerce act extends the power of Congress to water lines, while, as a matter of fact, water lines, as in the original law, come under the jurisdiction of the act only when part of a continuous carriage by rail; the other, that the Northern Securities decision held a corporation chartered in one State to own stock in corporations engaged in interstate commerce to be a combination in restraint of trade, whereas, the vital point in the decision rested upon the fact that the corporations whose stocks were owned by the Northern Securities Company, were parallel and competing carriers.

Two chapters are given to the rate problem, with some suggestions for its solution. So far as passenger traffic is concerned, the author would have a rate fixed by law which should represent the cost of an average standard of service as to speed of trains, character of equipment, safety, comfort, and convenience, and he would allow the railway company to make an extra charge for a higher grade service to meet existing demand. This is the oft-suggested plan for class rates. In this proposal there is nothing impracticable, although the author does not sufficiently provide for the difficulty of determining accurately what is cost of service in even so simple a matter as passenger transportation. As to freight, he rejects altogether the scheme of basing rates on cost, and leaves them to be determined, as now, in accordance with what the traffic will bear. His chief concern is with the just relation of freight rates, and particularly with the eradication of unjust discriminations now prevailing between competing points and those served by a single carrier. Here his suggestion is only ameliorative, merely the proposal that local stations should be relieved by rates which diminish as the business of those stations is brought within the zone of influence of the competitive points; that is, that rates should be less, the nearer the local station is to the competing point, in such a ratio that the difference in rates alone would not be sufficient to divert business from the local station to the competing point. Whether this palliative would stand the judicial test is doubtful under the decisions of the Supreme Court in the long and short haul cases. In this same connection, the author urges the restoration of pooling agreements.

Railway train service is handled vigorously with many suggestions for reform, such as thorough inspection, with prompt publication of results; approval by law of codes of train rules, with penalties for infraction; compulsory arbitration of labor disputes when necessary to prevent interruptions in regular train service; and penalities for delayed trains, more severe in the case of passenger than of freight service, because in the former instance recoveries for damages are seldom possible. These penalties the author defends by insisting that the fault lies not with the plant, but with the management, an opinion which it is difficult wholly to endorse. To insure justice to the roads in the enforcement of penalties, Mr. Haines proposes to classify them according to the service which they voluntarily offer to render, and to hold them rigidly to the equipment and construction necessary for the service proposed. Thus for high-speed service, which, he asserts, is in the near future to be electrically operated, he would require a reasonably straight four-track road, the elimination of crossings at grade, and the best of safety appliances. For the lower classes of service the requirements would be less severe, but the standard set should be carefully maintained through inspection and penalties.

Further remedies advocated for the relief of existing conditions are all along the line of conservative regulation; the jugglings of railway financiers as exemplified in the Alton deal, Mr. Haines denounces in no uncertain terms; and he urges that no further consolidation of existing railway corporations be permitted except with specific legislative assent; that the operations of railways should be confined strictly to transportation business; and that traffic associations should again be legitimatized and brought into formal coöperation with the Interstate Commerce Commission for the equitable adjustment of rate problems. This last idea, whose practicability is being so well demonstrated at the present time in the coöperation of railway officers with the Commission for the formulation of an accounting system, might result in rolling a good many burdens from the stooping shoulders of the commissioners.

The Nature and Purpose of the Universe. By John Denham Parsons. Pp. 547. New York: A. Wessels Co.

It would perhaps be easier to discover the nature and purpose of the universe than the nature and purpose of this book. It has been vouchsafed to only a few to have definite information on this subject, and Mr. Parsons has been even less successful than others in his attempt to solve the riddle. His failure to reach even plausible conclusions is made more apparent by his peculiar literary style. Compared to him, Dr. Johnson was a veritable Victor Hugo in conciseness and brevity. One may open Mr. Parsons's book almost at random and find sentences of three hundred words or more, few of which convey any definite meaning.

He repudiates both materialism and spiritualism. By the latter term he denotes the theory that mind exists independent of body. His own opinion is that mind is "a thing in itself," but that matter is not, yet that a finite mind cannot exist as such without a body. It is not possible here to follow the author, as he wanders about seeking to justify this doctrine. The first part of his work is taken up with quasi-metaphysical definitions, most of which are vague assumptions; the second consists of criticisms of those who deny immortality; the third discusses the Christian doctrine of resurrection as set forth in the New Testament; the fourth gives an account of "other gospels," and deals specifically with the ideas of reincarnation and transmigration. The remainder of the volume is occupied with a rambling and partly incomprehensible treatment of certain philosophical and psychological ideas, such as free-will, heredity, space, and time. The closing words of the last chapter, entitled "The Vision Splendid," afford a fair example of the author's lucid conclusions:

> For the *Prothesis* of the ages, that "enternal purpose" of a mind universal which alone can adequately account for what man finds to be the ubiquitous and unescapable dominance of abiding law and a great scheme embracing all things existent and that clearly is traceable to an Uttered Word and a Thought Unspent, etc.

This, in short, is a book that would not deserve notice were it not representative of a half-superstitious literature now devoured by large numbers of ignorant persons, who would stumble over the simple principles laid down by Bacon, Descartes, and Newton, but who read with avidity, even if they do not understand, "New Thought" publications and superstitious, unmeaning treatises, of which Mr. Parsons's work is an ambitious—we had almost said a ridiculous—example.

Science.

The Nutrition of Man. By Russell H. Chittenden. New York: Frederick A. Stokes Co. $3 net.

This book, the outcome of eight Lowell Lectures, given last winter, is put forth with the avowed purpose of directing attention to right methods of living. In the first four chapters there is an account of the processes of digestion, absorption, and assimilation and an outline of the doctrines of metabolism. Here the author offers relatively little of his own, and even shows almost too much willingness to present the conclusions of others without that critical discrimination which some of them require. The limitations of the Atwater food tables ought to be more explicitly stated; and the significance of the amino-acids and the purin bodies, while indicated, is hardly emphasized enough to meet the needs of the laity.

The main interest of the book centres in the discussion of the food requirements of man. Two of these chapters are mostly a neat condensation of the author's earlier book, "Physiological Economy in Nutrition." There, it will be recalled, he had shown that the common "standard diets," calling for at least 105 grammes of absorbable albuminous bodies and involving the excretion of at least 16 grammes of nitrogen every 24 hours, are capable of marked reduction. Certain academic persons, a few college athletes, and a number of men of the Government Hospital Service were under observation for some months, and remained in good condition, or even improved, as to well being and strength, despite a lowering of the intake of albumins so that the amount ranged from 36 to 53 grammes, only a third to a half of the "standard." New in this part is the statement that the person with whose metabolism the author is most intimately acquainted has continued the low diet for several years with apparent advantage. Also new is the allusion to the experiments of Fisher, since published, which are interpreted as confirming the view that there may be an actual gain in endurance on a diet much restricted as to nitrogen.

Yet more interesting and altogether novel is the partial report of an extended series of experiments with dogs, being a study of a "low proteid diet for high proteid animals." Other investigators had asserted that dogs do not thrive on small supplies of albuminous material; more exactly that their nitrogen income may not fall as low as 0.3 gramme for each kilogramme of body weight, or about 19 grammes of albumin for a dog of 10 kilogrammes, even though added non-nitrogenous substances bring the "fuel value" of the food up to 100 large calories for each kilogramme. Noting that these investigations had involved a somewhat monotonous diet and possibly detrimental restriction to the metabolism cage, Professor Chittenden undertook to examine the behavior of such animals under more favorable conditions; that is, to vary the diet while restricting it carefully as to nitrogen, to give abundant freedom with fresh air and exercise in an open court, and to limit the cage life (absolutely necessary for a study of the excretions) to ten days in each of the six to twelve months covered by these studies. Altogether some twenty animals were used, but only six are included in the report, which is said to present typical results. Subject to revision when the final report is published, it appears to be demonstrated that even a carnivorous animal may do perfectly well on an intake of nitrogen as low as 0.25-0.30 gramme per kilogramme if other food materials bring the available calories up to 70-80 for each kilogramme. Photographs bear out the assertion that the animals were not harmed by the experiment; they even gained in appearance and weight; only No. 3 seems somewhat underfed as indeed the tables also show.

The conclusion of the author is then that a marked reduction in the nitrogenous portion of our food is fully demonstrated to be possible, safe, and rational, being truly economical for the body as well as the purse. The amount of the proper reduction is somewhat vaguely given as such that a man of 70 kilogrammes (about 150 pounds) shall consume 60 grammes of albumin and enough other food substances (fats and starches) to make up about 2,800 calories daily, the amounts varying with weight and activity in a fashion nowhere clearly defined. Sample dietaries are given but merely as illustrative of the general plan. There is no advocacy of a particular food nor is flesh in small amounts held to be profitless, and vegetarianism is not the goal. Professor Chittenden declines to be counted among the "one-mealers" and shows little sympathy with multi-mastication, an attitude he has taken anew in a more recent study of the author of Fletcherism.

As a painstaking and diligent research this work deserves the highest praise. Acceptance of the conclusions as a basis for practical living is another matter, and one where skepticism is quite justifiable. Questions of nutrition are possibly far too complex to be settled merely by chemical analyses and the rule of three. Professor Chittenden constantly suggests a vague doubt, and often intimates that differences in the various albuminous compounds available as food, in a measure due to the amino-bodies which are as yet but partly worked out, may lead to definite limitations of their use. Then, too, the application of the doctrine of a reduced nitrogenous metabolism with reference to age and sex and other individual differences involves great difficulties, too little indicated in these lectures. The zealous reader will be much more impressed by the idea that the human body really only requires the low intake of nitrogen and calories, that the sooner he gets down to that lower level the better for him.

It may be admitted that existence on a low nitrogen level is demonstrated to be possible to an unexpected degree, and that here is a therapeutic resource of the utmost value. The tests of endurance by gymnasium methods are not without significance, but they prove little where much needs to be known. The real problem is that of resistance, the power of the body to withstand varied assaults from without and within, assaults which are not definite in their occurrence as to time or frequency, but which are nevertheless of fundamental importance. All the newer studies of immunity and kindred subjects show that the factors of resistance are extraordinarily varied, and should lead all who have any breadth of biological outlook to be mindful of the risk which reduction of diets may involve. The experiments of Hunt in this direction are too few to be conclusive.

This book makes the common assumption that economy is a very laudable virtue, that nature is economical. The fact is that nature is often terribly extravagant; in many matters she is wasteful to an extent that would not be tolerated in a modern factory. A well-known physician not long ago pointed out that the human body is by no means constructed along economical lines, and carries on much of its work with an expenditure that seems unnecessarily liberal. The point deserves wide and careful consideration. It is a fair inference that the animal machine is built and run with reference to larger ends than the economies of the moment, and this requires a notable reserve in structure and material. To keep up this reserve (the term is necessarily indefinite) may demand expenditures and activities not obviously a part of the ordinary work of the body, and yet be a very desirable end. Undoubtedly harm often does come from generous living because of the task imposed upon the kidneys and other organs, or possibly through the too free formation of toxic substances, but it is yet an open question whether this harm is as general or always as serious as some students of dietetics assert. It is quite possible that more damage is caused by certain kinds of albumin than by liberal quantities of the right kinds. Then, too, it ought to be remembered that life is in a sense the sum of responses to a vast number and variety of stimulations, and it is well within the range of possibilities that what from a purely chemical point of view seems to be an excess of food substance may actually be helpful to the body as a source of desirable stimulations. And again there is the question, and a very interesting question it is, too, of the part played by the salts which vary markedly as to quantity and quality in our foods. The problem of nutrition is too large for further discussion here; in any case it is much bigger than the question of nitrogenous equilibrium, and the layman may not yet solve it off-hand by an inspection of tables of food values.

The book is excellently printed. It may be noted that the calculation of heat units is not quite consistently carried out, and that the table on page 289 needs much correction.

The Embossed Scientific Books Fund is the practical outcome of a movement in England for the promotion of the scientific education of the blind by aiding the publication of embossed books on scientific subjects. At present the expense of printing a book in Braille type makes the price almost prohibitive. An edition of C. Smith's "Elementary Algebra," recently published by the British and Foreign Blind Association, consists of five large royal quarto volumes, costing (16s. 6d.) some four dollars. Lord Rayleigh commended the movement in his presidential address to the Royal Society in November, and it is hoped that soon standard scientific works will be printed in embossed type at relatively low prices.

The new bibliographical work, "Les Nouveaux Livres scientifiques et industriels," comprises the period from July 1, 1902, to June 30, 1907, noting 5,541 volumes, with a summary of contents for all French books. It makes 416 large octavo pages, of which 36 are given to alphabetical tables of subjects and authors' names.

"De l'Homme à la science," a new volume of the tireless speculator of the Sorbonne, Félix Le Dantec, poses the question: Can science, which is man's creation, study man himself? The doubtful answer seems to involve the view that the entire history of man, from the emergence to the total subsidence of the species, is not more than that of any other series of ripples set up and extinguished by the never-ending mechanical composition of forces which is the universe.

The tenth fascicle of scientific documents published under government auspices by Prof. L. Joubin of the Muséum d'Histoire naturelle from the reports of the French Antarctic Expedition (1903-1905), commanded by Dr. Jean Charcot, contains Pinniped Mammals, by E. L. Trouessart; Birds, by A. Menegaux; Embryogenic documents (Birds and Seals), by Dr. Anthony—in all 128 pages, with 19 inset plates.

By the will of the late Morris K. Jesup the American Museum of Natural History is to receive $1,000,000, the income to be devoted to the extension of its collections.

Drama.

Tragedies of Seneca. Translated by Frank Justus Miller. University of Chicago Press. $3 net.

Nothing derogatory to Mr. Miller's work is meant when we say that Seneca is probably the easiest of all Latin poets to render into English. The very fact that these tragedies, rather than those of Sophocles or even Euripides, are the real inspiration of neo-classicism shows how easily they can be assimilated. They are in fact a kind of dragoman between the ancient and the modern stage. No man has yet succeeded in transferring the peculiar Attic qualities, of, let us say, the "Œdipus Tyrannus" into the new speech; the moral ideas and the irony lose their force, the subtle style loses its grace. But neither of these difficulties confronts the translator of Seneca. In place of the moral conception of life so essentially of the old world, there are long physical descriptions which have the same force for us as they had for the Roman reader; and the style, while often truly poetic, has no elusive subtleties. The life portrayed moves in that generalized, and to a certain extent commonplace, sphere which belongs to one age as well as another. It is probable that most readers will feel less estranged by these plays than by any possible version of the Greek drama. Professor Miller deserves high credit for making the best of these opportunities, and producing a book that is at once good reading in English and a faithful reproduction of the spirit of the original. His choruses are sometimes a trifle flat, missing the gravity of the original, but, in the longer narrative and ornamental passages of the dialogue he has been singularly successful. It is a fact that in order to produce the same poetic effect there must almost always be a slight heightening of the style in passing from one language to another, and Professor Miller has used, but not abused, this legitimate instrument. Take an example or two from the long *rhesis* of Creon in the "Œdipus" of Seneca. The original.

> Ipse pallentes deos
> Vidi inter umbras; ipse torpentes lacus
> Noctemque veram—

becomes in Professor Miller's version:

> I saw, myself,
> The sluggish pools amidst the dusky shades;
> I saw the shadowy gods, and the black gloom
> No earthly night can give.

Again,

> Et una quidquid æternæ creant
> Celantque tenebræ,

becomes,

> And all the ghastly forms
> Which spawn and lurk within the endless shades.

Or again,

> Iterque populo Ditis ad Superos datur,

becomes,

> And, for the dwellers in the home of Dis
> A way is opened to the world of light—

where Seneca is doubled with Milton. These, we hold, are legitimate devices, the only means by which the force of the original can be preserved.

Professor Miller has added two useful appendices: "Index of Mythological Subjects" and "Comparative Analyses of Seneca's Tragedies and the Corresponding Greek Dramas." Prof. John Matthews Manly has contributed an Introductory Essay dealing with "The Influence of the Tragedies of Seneca upon Early English Drama"—this is a fair piece of work so far as it goes, but we could wish so admirable a translation were provided with a thorough going study of the tragedies and of their place in European literature.

John Jay Chapman has withdrawn himself so completely of late years from literature that any announcement of work from him is agreeable. Next month Moffat, Yard & Co. publish "Four Plays for Children," written in blank verse and suitable for acting.

Mrs. Patrick Campbell will produce the English version of "Electra" made for her by Arthur Symonds, in the Garden Theatre in this city, on February 10. Mr. Symonds's adaptation is from the German of Hofmanstahl.

Edith Wynne Matthison will be acting in this country again before long. She is to star in the new play of her husband (Rann Kennedy), "The Servant in the House," and she will be supported by Walter Hampden, at present acting in "Irene Wycherley."

The committee of the Henry Irving Memorial announces that the statue will be erected in the centre of the broad pavement to the north of the National Portrait Gallery in the Charing Cross Road. Thomas Brock, R. A., is now proceeding with the work.

Music.

The Pianolist. By Gustav Kobbé. Moffat, Yard & Co.

When the mechanical or semi-automatic piano players first came into use, the professional musicians sneered at them, and perhaps these inventions deserved no better reception, for they were crude and unsatisfactory. There are now about eighty different manufacturers of such "players," and while some makes have remained in the stage of musical toys, others have developed into instruments that have aroused the wonder and admiration of great composers, and have been adopted at leading universities and other institutions as valuable aids to musical education. To-day almost as many mechanical players are sold as pianos, and it was inevitable that a special literature devoted to this new branch should make its appearance. It began with magazine articles setting forth the scope and value of the piano players, and now we have a whole book on the subject. Its author, Gustav Kobbé, has always been among the pioneers in clearing new paths, and in this volume, as in his "How to Appreciate Music," he is not afraid to express his opinions freely, even when they clash violently with traditional views and prejudices.

The "Pianolist" is intended as a guide for pianola players, and it is constructed on an ingenious plan, suggested by the experiences of a friend of the author. This friend, whose musical taste was utterly undeveloped, bought a piano player and with it an assortment of the lightest kind of music, the kind he himself now regards as "trash." Nevin's "Narcissus" happened to be included in this first set of rolls. He tried it over, but thought it dull. After a while, however, when the other rolls had begun to pall on him, he played it again, and found in it something that he missed in the others; and this was his first step toward better things. Acting on this hint, Mr. Kobbé starts with Nevin, as a representative of the higher salon music, and tells the reader with which of his pieces he ought to familiarize himself. Then follow pieces by Moszkowski, Paderewski's minuet and cracovienne, pieces by Chaminade, Liszt's "Campanella," thus leading the player gradually to "the thrill of the great masters." Nine pages are devoted to Liszt and his rhapsodies, and Chopin, "the goal of all pianists," has a whole chapter. That the average pianola player has already reached a surprising stage of culture is evinced by the fact that a list which has been made of one hundred favorite compositions for the pianola includes no less than twenty-six works by Chopin, who therefore "would seem to be the goal of the pianolist as well." The list referred to includes only serious music, and it is of interest to note that at the head of it is Liszt's second Hungarian rhapsody. The slow movement of Beethoven's fifth symphony ranks seventeenth, whereas the first is as far down the list as thirty-seventh, and the roll with the last two movements as sixty-fifth. Grieg is another favorite, especially his "Peer Gynt" music, of which Mr. Kobbé gives an elaborate account.

A new edition of Wagner's complete literary works is to be issued soon in ten volumes, with a supplementary volume of critical matter by Hans von Wolzogen. Wolzogen has also edited a volume containing sketches made by Wagner for "Die Meistersinger," "Tristan," and "Parsifal." Another addition to Wagner literature is "Wagner Anekdoten," a collection of anecdotes compiled by Erich Kloss (Berlin: Schuster und Loeffler).

Peters of Leipzig announces for next autumn an exhaustive Life of Grieg by G. Schjelderup and W. Niemann. Schjelderup is the author of a biography of Grieg, in Norwegian, while Niemann not long ago wrote a book on Scandinavian music.

Mozart's operas are regarded as the supreme test for singers of the Italian *bel canto* school; they were written, with two exceptions, to Italian texts and are generally classed among Italian operas. Yet they have never been popular in Italy, and apart from their flowing melody and occasional coloratura they are really much more German, or rather Austrian, than Italian. Their best interpreter for many years has been Gustav Mahler, whose production of them in Vienna became as famous as the Wagner performances at Bayreuth and Munich. Mr. Conried, having been savagely criticised for the slovenly manner in which he presented the Mozart operas, made amends by importing Mr. Mahler and asking him to show the real Mozart to the patrons of the Metropolitan Opera House. He did so, a few days ago, as far as the conditions permitted. For ideal Mozart performances the Metropolitan is too large, and it lacks, too, the facilities for the rapid changes of scenery required. On the other hand, Mr. Mahler had at his service a much finer cast of singers (Sembrich, Eames, Gadski, Bonci, Scotti, and Chaliapine) than he ever could have had in Vienna. The result was a representation which in the matter of detail and respect for tradition eclipsed all others heard here within a quarter of a century. It must be admitted, however, that in some respects the performances of "Don Giovanni" given at the Manhattan Opera House have been more enjoyable. Mr. Renaud in the title rôle and Mr. Gilibert as Masetto are far superior to their rivals at the other house, and the comedy is also more enjoyable at the Manhattan because the theatre is smaller.

The most successful opera written by Tchaikovsky, "Eugene Onegin," will be produced at Carnegie Hall Saturday evening and Sunday afternoon in concert form by the New York Symphony Society, with a cast including Emilio de Gorgorza, Miss Rose O'Brien, Miss Marie Stoddard, Mrs. Taylor-Jones, Ellison Van Hoose, Tom Daniels, and Paul Dufault. The choruses will be sung by the Oratorio Society.

Edward Alexander MacDowell died in this city January 23. Within a year after his retirement from the post of professor of music at Columbia University, in 1904, Mr. MacDowell suffered a nervous breakdown, from which he never recovered. He was born in this city in 1861, and as a boy he was not a precocious genius. In 1876, he was taken to Paris to study the piano, and he entered the Conservatoire a year later. Even then he was not wholly devoted to what was to be his life work, for when a well-known painter offered to take him in hand if he would forsake the piano, the boy was eager to make the change. Only his mother's firm objection kept him in the path first chosen. When he left Paris he went to Frankfort, where Raff was in charge of the Conservatory, and Clara Schumann and Carl Heymann were among the piano teachers. In 1881, when Heymann left the institution, he suggested MacDowell as his successor, but the American was regarded as too young. He taught at Darmstadt and Wiesbaden till 1889, when he returned to America. He had already written a number of pieces of music, and had secured recognition from Liszt, among others. In this country he first made his home in Boston, where he won a high reputation, both as a teacher of music and a composer. He achieved his first triumph in New York when, in the double rôle of composer and pianist, he played his second concerto with the Philharmonic Society in December, 1894. On January 23, 1896, the Boston Symphony Orchestra paid him the compliment, probably unprecedented, of placing two of his longest works on the same programme. He was elected professor of music in Columbia University in 1896, but he resigned in 1904. In a letter which he published at the time he complained that the university was minimizing the importance of training in the fine arts. After leaving the university, he resumed his private teaching; and one day a week he gave up to pupils who could not afford to pay for lessons. Like many other modern masters (Chopin, Franz, and Grieg, for example), MacDowell preferred the shorter forms of composition. Nevertheless, he wrote two concertos for pianos and four pianoforte sonatas which are among his best works, being in point of inspiration far superior to anything of the kind ever done in America. Of his orchestral works only one, "The Indian Suite," belongs to the period when his genius had fully matured. The others, however—"Lancelot and Elaine" and "Hamlet and Ophelia," as well as his first suite—contain much that is charming. As a writer of songs and pianoforte pieces he ranks with the best European masters of the time. Especially notable are his collections of short pieces—"Woodland Sketches," "Sea Pieces," "New England Idyls," etc. While he was conductor of the Mendelssohn Glee Club he wrote some fine part songs; his *Lieder* or lyric songs for one voice, about fifty in number, are the best songs ever written in America. Not a few of them are set to poems of his own. A volume of his verses was privately printed a few years ago.

By the death of August Emil Daniel Ferdinand Wilhelmj, in London, January 23, the world loses one of its greatest violinists. He was born in Usingen near Wiesbaden, in 1845. His father, who was well-to-do, played the violin uncommonly well, and his mother the piano. The boy himself exhibited extraordinary precocity in mastering the violin, and was accordingly placed under a competent teacher in Wiesbaden. By the time he was nine years old the child played Vieuxtemps's E major concerto, Ernst's "Othello" fantasy, and two of Paganini's caprices at the court theatre. But the father, unconvinced of the extraordinary talent of his son, gave him a solid scientific education. As the lad, however, was still devoted to the violin, Herr Wilhelmj decided to leave to Liszt the decision as to his career. Liszt, after hearing the boy play, cried, "And they could be doubtful about your calling! Music is born in you." In a few days Liszt took young Wilhelmj to David at Leipzig, and handed him over with the words: "I am bringing you a second Paganini! Take good care of him!" August then studied at the Leipzig Conservatory for four years; worked in Frankfort under Raff; and then made his first concert tour in Switzerland. In the following year he visited Holland and London, being just twenty-one. His reputation was soon firmly established, and he drew large audiences in the principal cities of Europe. In 1878 he made his first visit to the United States. Thence he started on a tour round the world, which lasted for three or four years. In 1894 he was appointed head professor of the violin at the Guildhall School of Music, London. He was the author of a number of solo pieces and transcriptions for the violin, but it is as an executant that he will be longest remembered. His skill was exhibited to especial advantage in his chamber music playing. Although he had a strong feeling for Beethoven, he followed with like appreciation the refined lines of Mozart and Haydn. Another specialty of Wilhelmj's art was his polyphonic playing. No one knew better how to make clear the intricate counterpoint of a Bach "Chaconne," and in his hands Schubert's "Erl King," arranged by Ernst for violin alone, became a marvel of perfection. He was noted, also, for the sensuous beauty of the tone he evoked from his instrument.

Art.

THE WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

LONDON, January 19.

The Academy's indiscretions in the spring are as great as ever, but the splendor of its winter repentance grows less with years. Of late, there have been signs that England's supply of old masters is not without end, that the Winter Exhibition at Burlington House is becoming more and more of a problem. This winter, however, a surprise has been prepared. For the first time, in the many years I have been going to these winter exhibitions, a series of Hogarths has been got together; and this collection strikes me as something like a tribute to Whistler, to whom Hogarth always was the greatest English artist.

These Hogarths are of great interest, though they include nothing so fine as The Shrimp Girl at the National Gallery, or the Marriage à la Mode series. They are representative, for there are portraits as well as the subjects usually catalogued as "conversation pieces." Several are already being questioned by the detectives of art. From the Earl of Normanton comes a portrait group of four children, The Graham Family—astonishing not only in a vivacity which no other English painter of Hogarth's, or any generation, could rival, but in the exquisite and delicate rendering of detail. A little girl is dancing in the centre of the canvas and of the group, her skirt held out with both her little hands, while a boy seated at her side turns the handle of a musical box. The painting of the gown, with its rich flowered pattern, has no less charm than the grace of her pose, though tender color and grace are the last qualities the world has come to look for in Hogarth. The picture is full of detail, all as delightfully painted. Another portrait is of Peg Woffington; in it, however, character is somewhat sacrificed to prettiness. It is in curious contrast to the Sarah Malcolm, a small bust, the face cold, cruel, chilling, not a line made by age smoothed out, nothing in its expression softened—a face that in no way contradicts the note in the catalogue describing Sarah Malcolm as a murderess who was hanged for her crime. A large Southwark Fair recalls the Hogarth of the engravings, a picture crowded with incident—a story to almost every square inch of it. Three examples of Teniers in the adjoining room give the chance to see how much better Hogarth did this sort of thing. And there are smaller canvases; among the most notable is The First Performance of Gay's "Beggars' Opera" at Lincoln's Inn Fields in 1727, a picture that shows Hogarth no less masterly than the Dutchmen, in painting small interiors with figures, every detail worked out in the most wonderful manner, but never obtrusive, always in the picture, the atmosphere suggested with a truth the secret of which was lost to the generations which came after Hogarth. Remarkable, both in itself and as a record—a human document—is a painting of The Life School in St. Martin's Lane, established by Hogarth.

The canvas is fairly large, the nude model poses on his platform; in front the students, hard at work, are placed in two curving rows, which make fine lines in the composition. The room is lighted by a large, well-shaded lamp, hanging from the ceiling, and the careful study of light and shadow in the big gray room is extraordinary. The gray grows warm where the light falls on it, grows dim and cold in the shadows; and the modern master of tones and values could not surpass the marvellous way in which two or three life studies and a group of plaster casts, gray and shadowy, tell against the gray dimness of the wall in the far background.

Whatever his subject, Hogarth is, first of all, and above all, the painter; anecdote, subject, moral, are subordinate to the composition. Some of his subjects were forced upon him; he had to live. But like the earlier painters of Madonnas and Saints, of Crucifixions and Resurrections, he accepted the motives the age insisted upon, and adapted them to his art. How and what Hogarth painted when left to choose his subject may be seen in the lovely little portrait of himself at the National Portrait Gallery, in the incomparable Shrimp Girl at the National Gallery next door; and there is in the present collection a small sketch of a little girl, said to be The Painter's Child, that has something of the same freshness of treatment, the same breadth and gayety of vision. Never before has there been such a chance to study Hogarth. The student who goes from the Royal Academy to the two National collections, must not stop there; he should go still further—to the Soane Museum, and from there further still, to St. Bartholomew's Hospital, to learn what Hogarth could accomplish when he left plates and small canvases for large mural decorations. It is true that books, big and little, have been written about Hogarth, true that the few have always known him for the great man he is. But for the many he has been overshadowed by Reynolds, Gainsborough, and Romney, more generous than he with their concessions to the ideal of beauty, popular with the many. It is time that he should at last take his place.

The interest of the exhibition centres about Hogarth, but is not exhausted with him. The other rooms are filled in the usual manner, with a miscellaneous collection of Flemish, Dutch, Italian, and British masters, hung in some sort of chronological order. In the first room are the Primitives and their immediate successors. In many cases the catalogue ventures upon no attribution, but the merit of the pictures is not altered; and those to attract attention will still be, here some amusing little early Flemish and early French portraits, and there a Vincenzo Guarino, by Moroni; or, it may be, a Flemish triptych, full of the homely accessories the Flemings loved, the painter "Unknown"; and again a tiny Pietà, two graceful angels on either side the open grave, which I should find as dainty, if it were proved not painted by Filippino Lippi, to whom now it is attributed. In this room two things impress me above all else. One is the character in the portraits, and I cannot help mentioning, in particular, a panel lent by the Earl of Strathmore and Kinghorne, who makes no attempt to identify the artist; on one side is a portrait of Patrick, ninth Baron Glamis, accurate as a likeness, of that you have no doubt, though the elaborate dress and the flower in his hand are worked out with due appreciation of their decorative value; on the other side, his secretary, in dress almost as rich, a pen stuck behind his ear as symbol of his profession, and the man himself strong in individuality. The other thing in this room that leaves its impression with me is, as always, the charm of all the work as decoration; the walls give pleasure to the eye before the paintings that cover them are examined separately. The genius in the old days was as rare as now, but the craftsman then inherited conventions that lent distinction to everything he did.

Next in order come the Dutchmen and Flemings of a later date; nothing, however, in the room devoted solely to them that detained me, except, perhaps, a sketch by Rubens for the picture of The Meeting of Esau and Jacob in the Munich Gallery; a View near Delft, by Albert Cuyp; and the Interior of a Church by De Witte, who prepared the way for Bosboom. The greatest masters of Holland and Flanders are in the Fourth (the large) room, with Italians and Englishmen. But among these masters there is nothing to rival pictures shown on these walls before.

This big room is given over chiefly to the English portrait painters of the eighteenth century, though even they, despite the space devoted to them, do not make anything like so fine a showing as in previous years. It may be said that the numerous Sir Joshuas, almost all hung together, are representative. Here are two of his children—The Hon. Anne Townshend and Master Bunbury—children at whom I, for one, can seldom look without prejudice when I remember that they were the precursors of the Cherry Ripes and sentimentalities of the Victorian period. Here are his larger classical machines, Arabella, Lady Blake, as Juno receiving the cestus from Venus, and Lady Sarah Bunbury sacrificing to the Graces. Here are more or less perfunctory renderings of well-known men and women of his time. And here, to remind you of the great artist he was, though he could stoop to lower levels, are the beautiful Miss Orby Hunter and Miss Beatrice Lister. No portrait in the exhibition has the charm of the first of these two. He has spared us nothing of the loveliness of the face—a loveliness which never degenerates into mere prettiness, and his interest in his sitter is seen in the modelling of the features, above all the nose and mouth. And the color throughout is as lovely as the lady herself. After this, the Gainsboroughs seem weak, for there is not one of Gainsborough's masterpieces; and the Romneys wooden, though Romney so often pleases by his grace and decorative feeling, as in his really delightful Countess of Westmoreland. Hoppner, Raeburn, and Beechey carry on the fine tradition of portrait painting until it disappeared in the inanities and vulgarity of the early nineteenth century.

But as portrait painting deteriorated, landscape art in England was developing, even to a degree of greatness when it could set the standard for France; and there are two landscapes, at least, to remind one of the fine accomplishment of this very period to which one is apt to ascribe nothing but deterioration and worse. Both are by "Old" Crome. Poringland Oak is the more famous of the two. It has the fine luminous sky Crome painted at his best, with clouds sweeping across it; in the foreground is a pool with bathers who might have strayed from a Diaz; in the centre a great oak rises against the sky. As a rendering of light, the picture could not be truer to nature. There is only one fault: the tree is elaborated with a minuteness that would be admirable in a study, but is here out of place. In this light, against such a sky, in so spacious a landscape, it would be impossible to see branches and leafage in such minute detail; they would be seen in great masses, as Corot was wont to render them. No such defect, however, can be found in Crome's other canvas, View of Norwich, a wide landscape, well generalized, the cathedral spire rising in the centre, above, the pale, green-golden sky of evening, and the whole wide countryside flooded with the golden light. It is a picture that haunts you like the memory of some beautiful summer evening.

After these things, a room hung round with the poor little landscapes and seascapes of the late J. C. Hook comes as a disillusioning reminder of what the Academy really likes to-day. The endeavor of the Academy to do honor to recently deceased members by a special exhibition is, of course, most praiseworthy. The trouble is that the special exhibition often proves the grave of reputation. How empty Hook's most elaborate landscape or rock-strewn coast, after that sunlit view of Norwich; how photographic his figures after the little group of bathers under Poringland Oak! And the portrait of the painter by Millais, hanging in the centre of the room, is as commonplace after the men of Reynolds and Gainsborough, Romney and Raeburn.

Another departure this year is the opening of the black and white room to a collection of early English water-colors. The truth is that the early English water-color has been more overrated than any so-called form of art, the responsibility resting largely with Ruskin. Among the many who worked in the medium, the genius was the exception. For one Turner, one Bonington, one Cotman, the William Hunts, the De Wints, the John Varleys are legion. Even the very first water-color painters, like Girtin, used their medium in a tentative way. All this is so well known that the Academy's only excuse in making the collection would have been either to give it historic value, or to make it representative of the finest achievements in the art. It has done neither. Turner is but poorly shown; Bonington not at all; Cotman indifferently. William Hunt's tiresome plumes and birds' eggs, De Wint's mannered washes are most in evidence. Altogether, one could wish that the whole collection, with Hook's pictures, had been kept over for the spring exhibition, when it would not seem so out of place.

However, if much is included that might better have been omitted, if many of the masters have been better seen in previous years, the Hogarths alone, and, here and there, the exceptional masterpiece would make this winter's exhibition more than worth a visit. N. N.

G. P. Putnam's Sons have issued a third

edition of the "Renaissance Masters," by George B. Rose. To the studies of Raphael, Michelangelo, Leonardo, Titian, Correggio, Botticelli, and Rubens there is now added an essay on "The Art of Claude Lorraine."

The Christmas season has brought as a specimen of modern Christian art the Christus vor Jerusalem, reproduced after the painting of William Hole. This is the most recent addition to the series of Franz Hanfstängl of Munich, known as the Religiöse Kunstblätter nach Originalen moderner und alter Meister.

Among the painters of the late Renaissance and their continuators the Bassano family occupies a conspicuous place. Usually when one thinks of the Bassani he has only two members in mind, Jacopo and Leandro, and forgets that not less than twelve members of this family were painters, and that their artistic work covers more than four generations. Their pictures are numbered by the hundred. Naturally, in such a mass there is much that is destitute of originality. But some of the members of the "Bassani school" deserve more than passing attention. To distinguish these, to determine the artistic personality of the important members of the family, Francesco the Elder, Jacopo, Francesco the Younger, Leandro, Gerolamo, and Giambattista, to point out what is inferior school work—this is the purpose of Ludwig Zottman's new book, "Zur Kunst der Bassani" (Strassburg), in the series Zur Kunstgeschichte des Auslandes. By use of the material published by Signor Gerola, director of the picture gallery at Bassano, and a careful study of those paintings with authentic signature, Herr Zottmann guides us through the chaos of works contained in Italian and other galleries. Next to Italy, Vienna and Dresden are the most important places for the study of the Bassani. The biographies play only a secondary rôle—perhaps it had been better if he had given a little more consideration to these. The illustrations are numerous and well chosen.

"Promé et Samara," a handsome volume amply illustrated and published by the Société Française des Fouilles Archéologiques, relates the travels, researches, and excavations of Gen. L. de Beylié in Burmah and at the ninth-century capital of the Caliphs on the Tigris.

The exhibition of Ancient Umbrian Art at Perugia has occasioned one or two ephemeral publications in Italy which may serve to set in proper relief the semi-official record, "L'Arte Umbra alla Mostra di Perugia," by Umberto Gnoli (Bergamo: Istituto Italiano d'Arti Grafiche). Count Gnoli's opportunities were exceptional. He served on the committee of the exhibition and remained for months in Perugia with the best facilities for personal study and for consultation with visiting experts. Accordingly his attributions are more cautious than those of the official catalogue. He gives a brief but sufficient account of notable exhibits in each department, wisely leaving the 251 illustrations to tell in the main their own story. It forms a record quite as valuable in its way as that which Corrado Ricci compiled for the Sienese exhibition and more comprehensive. Articles of especial and novel interest to non-Italian readers are those on metal work and on those fascinating embroideries in blue and white with conventionalized beasts and plants. On contentious issues Count Gnoli is usually evasive, but he always gives the conflicting views. This book lacks an index, but as it is, all students of Italian art will want to have it at hand.

The same publisher presents a judicious monograph on the thorny topic of "Masolino da Panicale," by Pietro Toesca. He takes what we may call the orthodox view, admitting Masolino's participation in the Carmine frescoes, denying to Masaccio any share in those of S. Clemente, Rome, and regarding the decoration of the baptistery at Castiglione d'Olona as Masolino's artistic culmination. It should be said that all views bristle with chronological difficulties. These issues are not for a note. Where Signor Toesca deserves credit is in his clear perception and statement of the wide gap between Masolino and Masaccio at their first point of contact. There could hardly be a greater antithesis than that between the idyllic, colorful, and discursive mood of the master, and the epic, strongly shadowed, and concise manner of the pupil. A sense of these temperamental distinctions has prevented our author from falling into the facile confusion of the two masters that has prevailed since Vasari and has been unhappily increased by Crowe and Cavalcaselle. The monograph is completely illustrated, comprising all known or merely suspected Masolinos, except the fresco reported last December from St. Fortunato, Todi, by the critic F. Mason Perkins.

Among the exhibitions at the dealers' galleries in this city are pictures by J. Alden Weir at Montross's, till February 1; paintings by Allen Tucker at Fishel, Adler & Schwartz's, February 1; portraits by Wilhelm Funk, M. Knoedler & Co.'s, February 1; portraits by old masters, Ehrich's, February 15; mezzotints and stipples after Reynolds, Romney, and Gainsborough, Wunderlich & Co.'s, February 15.

At the American Art Galleries in this city some paintings by the late Albert Bierstadt were offered at auction on January 22. Among the prices paid were the following: Rocky Mountains—The Selkirk Range near the Canadian Border, and Last of the Buffalo, $1,100 each. A portrait of Mrs. Siddons, said to be a replica of Sir Thomas Lawrence's picture of her in the National Gallery, brought $1,025.

Théodore Jourdan, painter of animals, professor at the Marseilles École des Beaux Arts, has just died in his seventy-sixth year.

Finance.

THE QUESTION OF GOLD EXPORTS.

Rise in our rate of exchange on London to $4.87¼ has revived discussion of a possible large export of gold. Since October, ideas as to the bearing of exchange rates on the movement of gold have become somewhat confused. Between October 24 and October 26, sight exchange on London was quoted at $4.81, but we were unable to engage gold for import, although a fall to $4.83½ would normally make such import profitable. The reason was that our credit machinery had temporarily broken down. On the other hand, the rate went as high as $4.91 in the first week of November, and we imported gold in quantity, although even at $4.88½, we should be exporting, not importing. We were then able to import, because our banks offered three cents extra on every dollar to the international banker who should import gold. Now, however, that panic is definitely over, we are back on a normal basis of exchange.

Last year, when we began to export gold at the end of May, the first $2,000,000 went to Paris with sterling exchange no higher than this week's maximum. Is a large gold export therefore imminent? Many people point to our $209,000,000 excess of merchandise exports over imports, during November and December, as against the $118,000,000 excess for the same months in 1906, and the $170,000,000 in 1905, as evidence that we are not likely to send gold abroad. The visible trade balance, however, does not always settle the question. After a financial crisis, it rarely does. In the calendar year 1894, for instance, excess of merchandise exports was $152,000,000, against $109,000,000 the year before, yet gold exports were $101,000,000, against $79,000,000 in 1893. In the twelve months following the panic of 1873, the "trade balance" was $18,000,000 in our favor, where it had been $119,000,000 against us a year before; yet we exported $34,000,000 gold. On both of those occasions, the economic fact was, that we had imported gold from Europe, during the panic, merely to replace hoarded currency, and that when the hoarded cash returned to circulation, we naturally had more gold than was actually needed. Usually, also, trade reaction at such times so far reduces demand for currency that it piles up idle in the city banks and leads to an overflow of gold to Europe. Both these conditions exist to-day; the condition which did not exist in 1894 or 1874, but which does in 1908, is the Treasury's power to reduce a superfluous circulating medium, through calling in cash from its $230,000,000 bank deposits.

Taking the actual elements as they stand, however, it is in order to ask, what would a large gold export mean to the American markets? Would it aggravate the existing depression? Would it start financial uneasiness? In general, how would it affect the outlook?

When such questions are asked, the mind, as a rule, reverts to 1894. In that year, the heavy and persistent export of gold certainly did intensify depression and spread financial alarm. It did so in that well-remembered year, however, for a peculiar reason. In 1894, the country's circulating medium, amounting in all to $1,739,000,000, contained $604,000,000 gold and $450,000,000 government notes redeemable in gold at the Treasury. The government had stopped paying gold for its own expenditures, and a quiet hoarding movement had been the result. As a consequence, the government legal-tender notes were used almost exclusively in remittances to the New York banks, which, not receiving any gold on payments from the Treasury, used the notes for their payments to the government. The result was, that when the gold export movement began in quantity in March, the banks were compelled to obtain the necessary coin from the Treasury through redemption of these notes. But as the Treasury's $100,000,000 gold reserve against the notes was already greatly impaired—it was down to $65,000,000 in January, and fell to $52,400,000 in the ensuing summer—this process caused great uneasiness. It was felt that, if the reserve were to be exhausted, no other recourse than a lapse to a silver standard would remain. Each successive gold shipment brought such a possible crisis nearer.

To-day conditions are far different. Of the $3,079,000,000 total money circulation outside the Treasury, $1,355,000,000 is gold; that is to say, where only 35 per cent. of the country's money supply was gold in 1894, no less than 45 per cent. is in that form to-day. Furthermore, as against the $450,000,000 government notes outstanding in 1894, only $350,000,000 are in the public's hands to-day. There is therefore less reason to draw on the government's stock of gold to-day, and less power to draw if there were reason. And if both reason and power existed, the Treasury holds a reserve of $150,000,000 gold against its notes —$50,000,000 more than the normal reserve of fourteen years ago, and $85,000,000 more than what was actually held in January, 1894. This is one of the many facts which go to show the greater fundamental strength of the present situation.

A hearty welcome should be extended to W. H. Hull's "Practical Problems in Banking and Currency" (The Macmillan Company). This is a compilation of papers and addresses by representative bankers, economists, and financiers upon important questions of currency and finance. The first group includes sixteen papers upon banking methods and policies, the second contains twenty-seven papers upon banking and currency reform, and the third presents eighteen others dealing with the work of trust companies. Much of the material here collected is of great value, and the editor has done well to make it readily accessible to all students.

BOOKS OF THE WEEK.

Atlas of South Africa. London: Union-Castle Mail Steamship Co.
Bell, Mowry. Weeds and Wild Flowers. Boston: Badger.

Nation—"Piquant reading. Nor is satire wanting. . . . Perhaps the most interesting chapter is that containing a number of letters—the genuine correspondence of some unnamed genius—which are given to disprove the common saying: 'Letter-writing has become a lost art.' We can recommend the book as cheerful and dashing."

Outlook—"Now clean-cut and terse, going swiftly and trenchantly to the mark; now richly allusive and elusive."

Boston Transcript—"A freshness and piquancy wholly delightful. . . . Opens fresh doors into delightful thoughts and fancies."

Springfield Republican—"Quite up to the high standard of her 'Taper Lights,' of which The Republican was able to say that 'the first satisfactory stopping-place is the last page.' "

The Palaces of Crete and Their Builders

By ANGELO MOSSO

Very Fully Illustrated. 8vo. $5.25 net

This book is an important work on the beginnings of Greek civilization. The author was led from researches on the prehistoric Italians to an investigation of the remains in Crete, where the ages of stone bronze can be studied more thoroughly than in Italy. His book is a graphic account of the results of the excavations in Crete by the British and Italian Schools of Archæology.

HOUGHTON, MIFFLIN & CO., 4 Park St., Boston

Leaves from the Journals of Sir George Smart

Edited by H. BERTRAM COX and C. L. E. COX. With Portrait and Facsimile of a Canon by Beethoven. 8vo, $3.00 *net.*

⁂Sir George Smart was Organist of the Chapel Royal, St. James's Palace, during the reigns of George III., George IV., William IV., and Victoria, and was organist at the Coronations of the three last Sovereigns.

LONGMANS, GREEN, & CO.,
93 FIFTH AVENUE NEW YORK

The Most Comprehensive Chronology of the English Sovereigns

Ever offered. Gives the relations of the royal houses at a glance from Alfred the Great to Queen Victoria. A guide of exceptional value for Library or Class Room.

W. J. ROLFE says: "It condenses a wonderful amount of chronology and history into small space. I shall take pleasure in commending it to teachers and students as I find opportunity."

Professor HART (Harvard) says: "I have never seen a chart which brought out as clearly the relation between the various royal houses of Great Britain. It has the further merit of not being overloaded with detail."

The Nation.

NEW YORK, THURSDAY, FEBRUARY 6, 1908.

The Week.

No one who is familiar with Gov. Hughes's utterances could have expected anything sensational in his speech on national issues last Friday night. What he said was of a piece with his known character and his previous record. He confronts national questions just as he deals with State questions. He is frankly a Republican, but a progressive one, independent also, and firmly of the mind that administrative vigor is of the essence of good government. He is a States' rights man, desiring the highest efficiency of local government; but is just as decidedly for resolute Federal action where that is unavoidable. In a word, Mr. Hughes, the Presidential candidate, is precisely the same man we have come to know as Governor of New York. That he should either seek to put himself at variance with President Roosevelt, or toady to him, was unthinkable. His speech was in no sense a great one; perhaps inevitably it was general and rather non-committal in tone; but it was sound and steady. We believe also that it was politically sagacious. It will go well with Republicans of the sort who must furnish his chief support. With what the Governor had to say about a protective tariff, the *Nation* will not be expected to agree. Had Mr. Hughes had occasion to apply to this subject those keen powers of analysis which he has devoted, for example, to taxation of corporations and to franchises, he would not have dropped into the conventional but fallacious phrases about high duties making high wages possible, and so on. Still, even in the tariff question, Gov. Hughes professes himself open-minded. To any duty in the existing law that was plainly "exorbitant" or granted a "special privilege," he would be opposed; and he is for a general and scientific revision as soon as possible. It is now certain that no competitor of his in the Chicago convention will go further than that.

The drift toward tariff reduction in this country is unmistakable. A recent dispatch to the New York *Sun* tells us:

> Thirty or more of the leading members of the National Asssociation of Manufacturers, representing billions of capital and upward of two million votes, according to their own statements, are in Washington prepared to deliver a knock-out blow to the present tariff schedules.

The enlistment of this great organization in the cause of tariff reform is one of the notable events of recent tariff history. The Dingley Act was drawn not only for, but, in many instances, virtually *by* the manufacturers. If they are not satisfied with it, no one can be. The Manufacturers' Association wants a commission appointed at once to procure the data for a revision. This is not an abandonment of the protective theory. The indications of discontent among protectionists themselves only increase our regret that Gov. Hughes did not at least ally himself aggressively with those of his party who feel that their beliefs are travestied in the Dingley law.

President Roosevelt's message of last week urging an employers' liability bill reiterates his well-known views in regard to corporations and the criminal rich. The document is long, rambling, and repetitious. More serious, however, are the faults of temper. In conception and in style it falls far below the dignity of a state paper. Mr. Roosevelt has plainly been made furious by the attacks on him and his Administration and by the accusation that he is responsible for the panic. His return upon his assailants has not, we feel, materially helped his case. Men and politicians being what they are, it is inevitable that the Administration in power shall get the credit for every lucky event and the blame for every misfortune. Mr. Cleveland and the Democrats suffered; and now Mr. Roosevelt and the Republicans are having their turn. In such cases nothing but time and the calm judgment of posterity can properly distribute praise and censure; and Mr. Roosevelt must wait for that verdict upon his failures and achievements.

Beyond doubt, two recent decisions of the Supreme Court of the United States are severe blows to the methods of organized labor. Last week our highest tribunal declared unconstitutional the Erdman law, enacted by Congress in 1898, which forbade railroads or other carriers engaged in interstate commerce to discriminate against or discharge employees because of their membership in labor unions. On Monday the court decided that the favorite weapon of the unions, the boycott, is illegal when it is used to restrain or to injure the free movement of merchandise from one State into another. As there are few large enterprises which do not engage in interstate trade, the favorite weapon of the boycott thus loses much of its potency. Granting—as the *Nation* does—the many benefits which the unions have secured for their members, the desire of the unions to place themselves as a class above and beyond the law, has often made them hostile to American theories of personal liberty. The unfair advantages which certain forms of capital enjoy under our laws have furnished a demoralizing example to the laboring men. The Republican policy of protection has given employers special privileges, and the employed have naturally wanted similar favors for themselves. When courts have issued injunctions, organized labor has attempted to tie the hands of the judiciary. When legislators like Congressman Littlefield have asserted their right to oppose such proposals, the unions have engaged in a vindictive warfare against them. But now the supremacy of the union over the laws seems nearly at an end. And this change must work to the advantage of the unions themselves, in forcing them to rely more upon their legitimate strength, namely, the intelligence and the efficiency of the individual members. The union which can supply the most skilful and conscientious laborers can command the labor market without resort to illegal force.

Speaker Cannon's withdrawal of his opposition to the Appalachian and the White Mountain forest reserves is a happy event, for these projects are of high importance to the future of both New England and the South. "The list of organizations which in one way or another are aiding in the movement is too long to mention," says *Forestry and Immigration* in its last number. The passage of this bill would mean that the Government would take control, before it is too late, of the country's main supply of hard-wood timber, and also of the growths which chiefly regulate the flow of rivers supplying water-power to some of the great manufacturing States. The bill would make, at the same time, our forest reserve policy national in extent, instead of merely Western. If Speaker Cannon's belated support gains him some popularity at a time when popularity is uncommonly useful to a Presidential aspirant, he is welcome to it. "He who plants a tree," says the poet, "plants a hope." We know of no reason why political hopes should be excluded.

"More than a million dollars a day for military purposes"—this is not an estimate of the autocratic Russian government's expenditure to keep itself in power, nor of the bill paid by Germany to maintain a great fleet and keep up a standing army of 600,000 men. It is merely a conservative guess at what our peace-loving United States is to be asked to pay during the next fiscal year.

Congressman Tawney has pointed out that the estimates already received call for the enormous amount of $406,011,216, at a moment when our balance sheet may show a deficit of one hundred millions in the year 1908-1909. This total includes, of course, pensions; but, as Mr. Tawney pointed out:

> This stupendous sum of $406,011,216 is asked for simply for the military side of the government, and is larger than appropriations for the entire expenses of the government for any fiscal year since the civil war down to 1890, and not appreciably less than appropriations for any fiscal year prior to 1897, for the Spanish-American war.

But, as the Washington *Times* points out, this is not all, for it does not include the twenty-one millions paid out for the maintenance of the War and Navy Departments, or the forty millions asked for new battleships. If Mr. Roosevelt's military mania were to be allowed full sway, we should expend $467,000,000 in 1908-1909 for war purposes, past, present, and future, or one and one-third millions for every day in the year. There never was a more stupid spectacle than that of this country's assuming all the burdens of that Old-World militarism which annually drives to our shores thousands of immigrants.

Explanations of the panic have been almost as numerous as projects for currency reform. Senator Foraker, in approaching the subject before the dinner of the Ohio Society in this city Saturday night, was too shrewd to stake his judgment on a single cause. He admitted "many causes; for example, overtrading, over-expansion of credit, overcapitalization of new organizations, high prices of stocks, of labor, and of materials." But the Senator nevertheless had his own particular theory:

> All these had a share, but the chiefest of the causes may be summed up in the one word, "muck-raking"; chiefest because it was the fruitful, precipitating, first cause of all the mischief that followed.

Nobody, we suppose, will deny that "muck-raking" did have an effect in aggravating, if not in creating, the mental conditions which made possible the panic. But the investigator should go a little further, and inquire just why these published articles on the wrongdoing of individuals and institutions should have made so deep an impression. Our own answer would be that many of the accusations were true. We certainly had abundance of muck to rake in the life-insurance investigation, in the Union Pacific inquiry, and in the Public Service Commission's overhauling of the New York Street Railway's books. The long and short of it is that the muck was there. We do not observe, in the reports of Senator Foraker's speech, any reference to these scandalous evils, or to the necessity of restraining them hereafter. On the contrary, the Senator's main ground of congratulation is that, since the panic, "muck-raking articles have been at a discount," and that "a more wholesome sentiment prevails." Wholesome, no doubt, so far as regards the abandonment of such crude and hasty legislation as that of numerous States on railway rates. But if Mr. Foraker means that recent events have relaxed our efforts to hunt down financial rascality, expose its practices, and put a stop to it for the future, then, the result is not "wholesome."

At Berlin last Thursday President Hadley of Yale lectured on "American University Life." According to the Associated Press dispatch,

> He compared student life in Germany with that in America, summing up in favor of the latter, which, he said, while providing the highest degree of mental development and discipline, also encouraged a healthy love of sport, thus supplying a tendency to the physical improvement of the students, which was lacking in European universities.

The lecturer, we take it for granted, did not fail to explain the difference between the abstract ideal of physical exercise for all the students and the actual effect of our system of intercollegiate athletics in confining the benefits of outdoor sports to a small minority. President Hadley must also have told his hearers that America's far-reaching reform in higher educational methods—the substitution of physical for mental training—was not proposed and urged by educational experts. On the contrary, it has been carried in the teeth of conservative educators. Our oldest and most accomplished teachers, college presidents like Eliot of Harvard, and serious-minded fathers, have united in protesting that the college authorities should not virtually excuse members of the football team from academic exercises for the first two or three months of the autumn term; and that the whole interest of the undergraduates should not be centred in these gladiators, to the neglect of study. But our undergraduates and our young graduates have been the ones to insist that athletics is the interest chiefly to be cultivated. They have publicly and privately denounced as fogies those members of the faculty who suppose that studies come first; they have made it plain that the sentiment of the "student body" and of "influential alumni" favors the sacrifice of everything to the success of the teams. In this effort our irresponsible youths have been ably seconded by the press. With the newspapers shrieking through all our streets and with the undergraduates and young graduates howling on the campus, our college authorities have seen on which side the weight of argument lies. Under such pressure, harried by such ardent reformers, our teachers of the classics, of philosophy, and of mathematics have humbly acknowledged the error of their ancient way and have let the athletes determine more or less completely the amount of study and the kind of study that shall—for themselves at least—be required for a degree. Thus the present system of intercollegiate athletics has been forced upon our colleges by persons who know and care nothing about education.

President Hadley's efforts to persuade the Germans that our method is superior will not be wholly successful with those who may chance to read the recent report of a committee of the trustees of Williams, who have voted to allow fewer intercollegiate contests. According to this document, the number of participants in the games "has been insignificant in comparison with the number of students in attendance." The report continues:

> From the primary and proclaimed purpose of a college, there has been such a diversion to a secondary and subordinate incident of collegiate association, as to induce the student belief that the true college spirit is to be evoked not through the curriculum or in interchange of ideas, but most potently in the arena of athletic sport. Such in effect has been the formal declaration of the students' publications.

What is true of Williams is true, *mutatis mutandis*, of most of our Eastern colleges. Conditions are not unfairly described in the *Revue des Deux Mondes* for January 1, in which M. le Vicomte Georges d'Avenel gives the third instalment of his impressions of America. After speaking of the well-known industry of the French student, he adds:

> For young Americans, the thing which is most important in college is the sports. These sports change a little in the different grades, or classes, but maintain always the principal place in education. The glory of every university is not (like our *lycées* in their recent general competition) to win more prizes than other institutions for the dissertation or the Latin version, but to have the best rowers or the ablest players of baseball. The American succeeds in college by physical skill (*à la force du poignet*); he learns little, and is neglectful of diplomas—of little value and easily obtained.

This statement is, of course, not true of all colleges at all times. But there are few colleges in this part of the country which do not furnish many facts in support of the Frenchman's cruel generalization.

Prizes offered to artists who contribute to annual exhibitions are likely to reflect some particular hobby of the donor. A collector of landscapes or marines will give a prize for the "best" American landscape or marine. Or another amateur perceives that figure work is neglected, and so founds a welcome prize for that *genre*. The result is encouragement for art in a limited range. But a prize offered for the first time this year at the Architectural League indicates a broader view. This competition was for plans for a Pavilion and Open-Air Swimming Pool. Three or four arts are called upon—architecture for the pavilion, wings, trellises, pool, and landscape; sculpture for that end of the pool where the water flows in; mural painting for the loggia, which is to be the main feature of the pavilion. In order to enter for this prize, architects have had to associate with themselves sculptors and "murals." Since the new prize is not so large that it could be shared with two others, the Architectural League has applied the old prize for sculpture (the Henry O. Avery prize) and that for mural painting to this combined design. Our architects so rarely enjoy a chance to employ painters and sculptors in the original designing of their buildings that a competition of the kind, if continued year after year, ought to prove highly instructive to laymen as well as the profession, and hasten the time when no building of any pretence to beauty, private or public, will be undertaken without this kind of collaboration.

One phase of the Portuguese troubles that reaches beyond the limits of the Iberian Peninsula is the reported disaffection in Portugal's East African colony, stimulated by the news of events at Lisbon. Disorders in Delagoa Bay or in Angola, the colony on the West African coast, would be so serious as to arouse international anxiety. England has been spoken of as the historical friend of the Lusitanian kingdom, but it is in Africa almost more than at home that the present upheaval is likely to call for British attention. Should some form of civil warfare break out among the Portuguese on either coast, South and Central Africa would look forward with fear to the chances of native outbreaks, a possibility which is never entirely absent from the white man's consciousness in that continent. Zululand, for instance, where native unrest is again reported, is at no great distance from the Portuguese East African frontier. But Anglo-German rivalry might also come into play, in case conditions in Portugal—and what these are to be for some time to come we cannot tell—should suggest the possibility of a separation of the mother country from her colonies. Portuguese East Africa is bounded on the north by German East Africa, and on every other land frontier by British territory. Portuguese West Africa is bounded on the south by German Southwest Africa, and on the east partly by British Rhodesia. Chance of friction, therefore, exists.

The reasons why the Campbell-Bannerman Ministry should have decided not to reintroduce the Irish Council Bill in the present session of Parliament are not hard to find. A measure as tame as the one rejected by the Irish party in convention last year would, of course, have no reason for being. A bill strong enough to please the Nationalists would stand no chance in the House of Lords; and the battle with the upper house, for which plenty of ammunition already exists, has been postponed, as we have already been told, to some future session. Yet it is unfortunate that the Liberal party should be showing, in spite of much brave talk, evidences of last year's disposition to conciliate and modify, instead of forcing through a comprehensive programme of legislation by means of the still large majority. After all, it is work that counts with the mass of the people.

The Russification of Finland is now advocated in influential circles, though as yet the Emperor is reported to have arrived at no decision. Almost exactly three years after the dramatic opening of the Russian revolution with Father Gapon's march on the Winter Palace, and a little over two years since the Czar, under the stress of the great upheaval of October, 1905, gave to Finland at one stroke her ancient liberties, and more, the old reactionary pack is once more in full cry against the Grand Duchy. The present proposal is not only to remove the liberal Governor of Finland and to appoint a former subordinate of the notorious Bobrikoff, but actually to dismember the Grand Duchy by annexing the Viborg district to Russia. History can show few parallels to this swinging round so enormous a circle in so short time—from absolutism through reform, complete constitutionalism and the imminence of a social revolution back to where the champions of absolutism feel themselves securely in the saddle once more. Grumblings against Finland, $500,000,000 for a new navy, the same old game of border politics in Central Asia—the Czar's empire seems back at its old moorings.

The death of Cardinal Richard, Archbishop of Paris, will not help to improve relations between the government and the Church. The Vatican's irreconcilable attitude on the separation question makes it certain that Cardinal Richard's successor will be a man pledged to a continuance of the policy of non-accommodation on the important problems arising from the Separation law that still await adjustment. The new archbishop will probably be Monsignor Amiette, coadjutor to Cardinal Richard. He has been the virtual head of the see of Paris during the conflicts of the last two years. That circumstance, too, tended to soften somewhat the relations between the late archbishop and the government. The Ministry, for instance, hesitated to employ forcible means for removing the venerable prelate from his episcopal palace when the Separation law went into effect, and a delay was granted until the cardinal left his residence of his own accord. A younger and more energetic bishop, holding his appointment from a reactionary Curia, is apt neither to give nor to receive much favor in the struggle with the Jacobins—as the situation is regarded at Rome. While present tendencies prevail at the Vatican, it is rather unfortunate that old members of the French episcopate whose moderation of views has been repeatedly shown, should disappear and make way for militant successors.

Sir Oliver Lodge, if we may believe the dispatches, is convinced that he has received communications from three men who in their lifetime were interested in psychical research, but who are now dead: Edmund Gurney, Richard Hodgson, and F. W. H. Myers. In an address at the meeting of the Society for Psychical Research last week Sir Oliver declared:

> On the question of the life hereafter the excavators are engaged in boring a tunnel from the opposite ends. Amid the roar of the water and the other noises, we are beginning to hear the strokes of the pickaxes of our comrades on the other side. We have received what an investigation has proved to be messages from the dead through the mediums, Mrs. Piper and Mrs. Verrall.

This eloquence will, we doubt not, affect some of our younger readers; but it will leave those whose memories run back ten or twenty years rather cold. We should hesitate to say how many times within the last two decades communications with the dead have been definitely established by eminent divines, college professors, and distinguished scientists; and how many times these communications have been exposed as gross fraud or pathetic self-deception. The list of the misled is a long one and no less a name than that of Sir William Crookes is in it. The detailed evidence on which Sir Oliver rests his conviction has not been published; and until it is before us in fairly complete form we cannot analyze it. But one thing is sure: in such research the chances for trickery and error are innumerable; and proof far more cogent than has yet been produced is necessary in order to make it clear that Sir Oliver has not unconsciously translated his hopes into beliefs.

THE MURDER OF KING CARLOS.

Who the men were that shot down the Portuguese monarch and his elder son in Lisbon on Saturday is not yet clearly known. That the murder was a political act, there can be little doubt. The first impulse to throw the responsibility on aliens, or anarchists, is comprehensible enough in the state of public mind induced by so horrible a tragedy. But the latest news, the resignation of the Premier-Dictator Franco and the formation of a new cabinet, shows that events of Saturday have been accepted as a political protest that must not pass unheeded. Fear alone may not have induced Senhor Franco to resign. To the new boy-King and his mother, the chief minister could only be the man who, more or less directly, had brought about the disaster; and therefore coöperation between him and the young monarch would have been rendered difficult. Franco's successor, Admiral Ferreira do Amaral, was spoken of soon after the assassination, as the probable head of a new cabinet. Among the other members is José-Maria d'Alpoim, chief of the Progressive Dissidents, whom rumor connects with the assassinations. If this report is founded on fact, the change would indeed be surrender on the part of the government.

The situation in Portugal has been puzzling. Not the least incomprehensible feature was the late King's seeming disregard of the danger that threatened. Was it merely exceptional courage that made him appear in public, practically without protection, at a time when excitement was at fever heat and the police were discovering daily plots against the government? Or did the King really underestimate the force of popular resentment aroused by his anti-constitutional policy? That foreign observers should not have understood how earnest the Portuguese parties were in their controversy with the King, is conceivable. But that the King himself should have failed to gauge the feelings of his people or the strength of the opposition with which he had to contend, is astonishing. Yet that would appear to have been the case, to judge from the light-hearted tone of a statement he made to the representative of the Paris *Temps*, last November:

> Senhor Franco is the man I have wanted. For a long time I had my eye on him. At the opportune moment I called him. His merit consists in his faith in himself, in his star; and in the hours of crisis such confidence is a precious aid. We are completely in accord. He has my entire confidence. We shall hold the elections when it suits our own purpose. We are sure of a majority. The country will approve Senhor Franco's policy. We shall reëstablish financial equilibrium and wipe out the deficit . . . I know my country. Portugal needs quiet. I can see that wherever I go my people are with me.

But evidently the Portuguese people were not with their King.

In the protracted struggle between Carlos I. and the parliamentary parties, foreign opinion has in general sided with the King. The conflict has been usually described, and on the whole truthfully, as arising from the unmeasured corruption that characterized the two great political parties, the Regeneradores, or Conservatives, and the Progressives, or Liberals, with their offshoot, the Progressive Dissidents. The system of rotation was in force, a working agreement by which the two parties took turns at the public trough. Under such a régime, and with a court not averse to extravagance, the finances of the country fell into a deplorable condition. In 1906 the public debt of Portugal, a country with some 5,500,000 inhabitants, amounted to nearly $800,000,000. Sweden, with a population almost the same, had in that year a public debt of $90,000,000. In 1891 Senhor Franco organized the party of Liberal-Regenerators, pledged to a policy of reform. In 1906 King Carlos made him premier, and when all attempts at reform were blocked by the parliamentary opposition of the two great parties, the King resorted, in May, 1907, to a dissolution of Parliament and a dictatorship.

That such drastic action was necessary to save the country from ruin, has been the defence of Franco's adherents, a defence which has been received with approval abroad, including this country, where we like strenuous executives. Yet the tragedy at Lisbon has shown that suspensions of Constitutional forms and dictatorships are not easily to be played with. If the Portuguese politicians, in defence of an evil cause, were able to provoke resentment to the point where assassination becomes a possibility, it must mean that the people of Portugal value Constitutional rights above financial well-being. Benevolent despotism has its attractive side; but it is growing more and more difficult to justify suppression of liberty by the argument from expediency. Democratic institutions demand that the people, through their representatives, be allowed to work out their own fortunes. It matters little that oligarchic influence or party interests often assume the mask of popular liberty, as the case may be in Portugal. The principle is strong enough to bear such exceptions. The people prefer to stew in their own juice. A *coup d'état*, they feel, is not government: it is reversion to elementary strife, of which no one can foresee the consequences.

MR. CORTELYOU'S DEFENCE.

In his reply to the Senate's inquiries, the Secretary of the Treasury has made the best defence of which his government bond and note issues of November are susceptible. Since the government itself, by stopping sales when only $24,631,980 2 per cent. bonds and $15,436,500 3 per cent. notes had been allotted, instead of the $50,000,000 and $100,000,000, respectively, offered on November 17, has confessed its misjudgment of the situation, we should have been glad to pass the matter over without further comment. No one has impugned the motives of Mr. Cortelyou.

There is, however, an historical aspect of the government's intervention which cannot be dismissed so easily. Efforts have been made by some bankers—and efforts are naturally made in the Secretary's document—to argue that the action of the government stopped the panic. To this argument the fact that the condition of the banks did improve progressively after the Treasury's announcement, gives some apparent force. Mr. Cortelyou's statement is:

> While the pressure on the banks was not allayed at once by the measure, confidence was so far restored that the premium on currency fell immediately, and bids were received in such volume for both classes of issues that it was not considered necessary to allot even half of the total amount of the two issues.

Were this view to pass unchallenged, it is easy to imagine what use might be made of the precedent in a future crisis. Secretary Richardson similarly defended, in 1873, his illegal reissue of government notes retired by law, by asserting officially that the currency paid out "did much to strengthen many savings banks and to prevent a panic among their numerous depositors," and that it "fortified other banks, and checked the general alarm to some extent." Had financial and economic critics accepted this defence, and ignored the fact that the action of the Treasury not only encouraged loose views of legal restraints, but gave instant aid and comfort to the fiat-money school, it is highly probable that the affair would have been cited, in the panics of both 1893 and 1907, as an argument for arbitrary recourse to illegal paper issues.

The truth about last November's action, as the banking community now recognizes, is that the emergency was not such as to call for government interference. When the Treasury announced its note and bond issues, the financial strain, severe though it still remained on the day before the announcement, was showing distinct signs of relaxation; the bank returns, and the fall in the currency premium from 4 per cent. on November 12 to 1½ in the week before the Treasury moved, were indeed proof sufficient of ameliorating conditions.

With what seems a partial recognition of this fact, Mr. Cortelyou rests his defence of the recourse to a 3 per cent. note issue, when the Treasury's surplus was unusually large, on the plea that all but $5,000,000 of this surplus was on deposit with the banks. For public purposes, this was too small a working balance, yet the Treasury might "invoke a financial disaster by attempting to withdraw funds on deposit with national banks, at a time when they were subject to severe strain in meeting the business requirements of the country." But this plausible argument overlooks rather oddly the point that all the cash which the Treasury obtained from banks, in exchange for the new 3 per cents., would equally have to be withdrawn from bank reserves. If the whole cash thus received had been re-deposited in the subscribing banks, the Treasury's own case would have been precisely what it was before; and if part of it had not been re-deposited—which was the actual case—then the Treasury to that extent drew on the bank supply of cash, exactly as if it had called in the same amount from its bank deposits.

The whole November transaction, it may as well be admitted, was due partly, like the course of the Treasury in 1873, to a yielding to unreasoning pressure from panic-stricken business interests, and partly to misjudgment of the situation. It is an open secret that in certain important banking quarters it was expected that the government would connive at the grossly illegal use of these 3 per cent. certificates as actual reserve money, and there is reason to believe that even the Treasury had some idea of attracting hoarded money into subscriptions. To his lasting credit, Secretary Cortelyou gave an unhesitating veto to the first of these expectations; and the second was quickly disposed of by the course of events. It was soon discovered that, where individuals were tendering subscriptions to the government issues, they were planning to take the cash for payment, not from private strongboxes, but from the reserves of banks. All things considered, Mr. Cortelyou deserves credit chiefly for the readiness with which he recognized the mistake of policy, and the courage with which he abandoned it. Not every public officer would have done so much.

The main consideration, from the point of view of financial history and precedent, is that a time of financial panic is a time for the government, after using promptly its legitimate resources for relief, as Mr. Cortelyou did in his October deposits of public funds, to keep its hands off.

RAILWAY ACCIDENTS AND THE UNIONS.

We commented in our issue of January 16 upon the killing of 5,000 persons and the injuring of 76,286 upon our railways during 1907. Upon the vexed question of the relationship of labor unions to these appalling casualties, light has now been shed by J. O. Fagan's "Confessions of a Railway Signalman," in the current *Atlantic*, the second of two valuable papers. Speaking of President Mellen's recent statement that, so far as his roads are concerned, increase of pay is invariably followed by decreased efficiency, Mr. Fagan declares that "increase of pay and decrease of efficiency are both indications of loss of grip by the management," and adds that, "hidden away in this simple statement there is a whole world of significance." The power or pressure which induced Mr. Mellen to increase wages is the same influence which makes for decreased efficiency. This power is, Mr. Fagan declares, the "Railroad Labor Organization."

Mr. Fagan is himself a labor-union man who is not blind to the benefits that have been derived from organization. The unions have established a fraternal feeling, aroused a spirit of mutual helpfulness; they have beyond doubt contributed to the comfort and prosperity of almost every man in the service, and have done excellent work in obtaining protective legislation for railway workers. If this were all, they would, of course, deserve high praise. But there is another side. Mr. Fagan declares emphatically:

> For a great many years the influence of the railroad labor organizations has been consistently exerted, not only to raise wages and to improve conditions, which, of course, is perfectly proper and justifiable, but also to nullify discipline, to destroy personal management and authority, and to obliterate from all schedules and working agreements any reference to or consideration for the paramount interests of the travelling public.

This result, Mr. Fagan insists, is not only due to the indirect effect of union victories, but is directly achieved by agreements which "for the most part are secret documents."

This frank statement is alarming substantiation of what has long been more or less vaguely alleged. Additional confirmation of Mr. Fagan's view is also found in the open letter on railway accidents from W. H. Boardman in last week's issue of the *Railway Gazette*. Mr. Boardman, who is the editor of the *Gazette*, bluntly says that railway officers are in the main doing their best to prevent casualties, but that they "cannot be successful until they are allowed to control their employees." It is of his knowledge that, in the employment and discharge of enginemen and train crews, the unions have more authority than the employers, except on the Reading and the Chicago, Burlington and Quincy, "which have paid millions for the privilege" of controlling their own men. Actually, therefore, on nearly the whole of our American railway system the final responsibility for everything affecting the efficiency of the employees and their discipline rests, not with the officers elected by the owners, but with the leaders of the employees. The only wonder is that conditions are not worse.

Mr. Fagan does not think that interference with discipline is part of a formulated policy. Yet his specific cases in which guilty men have been forced back into their positions, makes it hard to share this view. While Mr. Boardman admits that railway officers are often legally and morally guilty of negligence, Mr. Fagan pays a high tribute to the division superintendents, who are, he declares, "among the hardest worked, most thoroughly capable and conscientious men in the United States." He quotes one of them as saying: "With a free hand, we could put a stop to this killing in a week." It is impossible, therefore, to avoid the conclusion that upon the labor unions rests a grave responsibility for the slaughter which not only makes our railways the most deadly in the world, but weakens our country by a shocking waste of men, and the annual addition of thousands to the army of the maimed.

To be absolutely fair, it is necessary to show, as in fact Mr. Boardman does, that of the 5,000 passengers and employees killed last year, only 776 died in collisions, while 1,873 laborers were killed on the right of way. But at least 1,000 lives can be saved, he thinks, by better discipline and inspection, and fully fifteen times that number of injuries may be prevented. Most startling of all is Mr. Boardman's proof that, besides the 5,000 passengers and employees killed, 6,330 other persons, mainly trespassers on the right of way, were also killed, making a total of nearly one thousand lives a month, or of fully *thirty a day*. The trespassers numbered 5,381, but it is not to be assumed that all were tramps, and therefore—from the economic point of view—lives of little value. In the West, the railways are often the directest, best maintained, and most interesting highways; hence the stream of walkers includes often the well-to-do and the efficient. The frightful death list might be much reduced by fencing and patrolling the tracks. Indeed, on this point of patrolling Mr. Boardman does not lay sufficient stress. The American railways use only 49,961 persons to guard crossings and watch the lines; but if they employed as many proportionately as the Prussian railways, this number would be 636,000. Even if only 200,000 more track-walkers were hired, there would be a great saving in lives, and many accidents due to defective rails, floods, dropping of loads from freight trains, and the like would be prevented.

Finally, Mr. Boardman contends that conditions would be bettered if the courts were to hold the general managers criminally responsible for preventable accidents. This would lead, we believe, to a speedy shaking off of at least a part of the union thraldom.

THE LATIN WORM TURNS.

It is almost exactly ten years since a Frenchman's book on "Anglo-Saxon Superiority" made a great flutter. Edmond Demolins, in writing "A quoi tient la supériorité des Anglo-Saxons," no doubt thought of himself as performing a patriotic service. His aim was to warn his countrymen of certain dangers, and to bid them study the sources of strength of other nations. But a storm of denunciation at once broke over him in France. He was a recreant son, exposing the weakness of his mother. Abroad, however, particularly in Anglo-Saxon lands, he was praised at once for his frankness and his philosophic judgment. A Latin had never looked so brave and wise as when confessing his inferiority to the Saxon. It soon became a commonplace that the peoples of Southern Europe admitted themselves to be decadent; and Demolins's book had perhaps something to do in prompting Lord Salisbury's characteristically indiscreet remark about "the dying nations." Of late, however, the Latin worm has turned. The races of meridional Europe may be dying, but are like the Irishman who said, after the accident, that, if he was dead, he was not conscious of it. Many vigorous protests have been made by Spaniards, Italians, and the children of the Midi against being despised or even ignored. We may mention Ferrero's lectures in praise of Latin civilization, delivered in Brazil and in Argentina and Uruguay—utterances which were warmly applauded. Summing up in the Paris *Figaro* his experiences as lecturer-errant, Signor Ferrero admits sadly that the impulse of Latin origin is growing feebler in Latin America, where "Roosevelt interests them more than Augustus, and Japan more than Gaul in Cæsar's time." Nevertheless, Ferrero asserts with emphasis his old thesis that "the Latin spirit" was never more powerful than to-day, and that it could be made most fruitful in its influence upon Anglo-Saxon, German, or Slav civilization.

More directly to the point is a recent Italian book, "Latini e Anglo-Sassoni." Its author, Napoleone Colaianni, controverts stoutly the prevalent assumption that the future is entirely in the hands of the Northern races. He reproaches his fellow-Latins for ever having admitted this idea, and then proceeds to carry the war vigorously into the enemy's country. He contests the whole idea of anything like a fixed hierarchy of nations. Leadership is always changing. England at various periods has been so corrupt and contemptible that it is ridiculous for her to plume herself over Spain, for example. Spain held the hegemony of Europe in the sixteenth century, but who can say that her fall was any more calamitous than that of England may yet be? And Colaianni asserts that Italy, which once led the world in government, as in letters and art, is to-day gradually regaining eminence in all those directions. His book is, throughout, a piece of valiant national and racial self-assertion.

It is naturally strongest when it deals with the graces and refinements of civilization. If international epithets are to be flung about, certainly Florence and Paris have as good a right as London or New York to apply the term "barbarians." And even in the matter of moral soundness, Signor Colaianni puts up a stiff defence. He quotes German authorities to prove that Paris is less immoral than Berlin, London, or New York. Conceding that the higher classes in France and Italy are more lax in morals than those of Northern countries, he affirms the contrary of the great bulk of the people. Nowhere are they more chaste than in Italy. And in the matter of infanticide, the Italian record is twice as good as the German. To this Italian writer, the slaughter of the innocents in other countries is more repulsive and more disgraceful than the *crimes passionels* of his native land.

Even in the matter of bodily training and athletics this audacious Latin challenges the lasting superiority of Anglo-Saxons. Italy is awaking to her needs in these respects. She indulges in no blind dependence upon physical prowess, for she remembers the extreme importance given to athletics by the Greeks and Romans, who nevertheless fell before tribes that had never seen a stadium or a bath. Colaianni is confident of the ability of his countrymen to adopt whatever regimen may be necessary to keep abreast with the foremost, for "the Latin intelligence is more lively, more prompt, and assimilates knowledge better than any other." How it would have delighted him to know that the most athletic of Anglo-Saxon Presidents, in urging Congress to provide an army of athletes, could find no better reinforcement for his argument than pictures of Italian officers performing daring feats of horsemanship!

Such a book is not to be taken too literally. It is, in essence, merely a sharp reminder that no nation likes to be either patronized or snuffed out; and that a certain arrogance of Anglo-Saxons, in the presence of Latin races, is as ill-founded as it is ungracious. By both parties to the dispute about superiority, it would be well to cultivate tolerance and, above all, an effort to understand each other. The time is past when a nation or a race can complacently classify those who are not altogether as itself as inferior and barbarian.

THE SHORT STORY AS LITERATURE.

The short story has arrived at the dignity of elaborate treatment by no less a critic than Prof. Brander Matthews in his latest book, "The Short-story: Specimens Illustrating Its Development," edited with introduction and notes. Let us say at the outset that Professor Matthews's work is adequate in its kind; nor can there be any objection to the kind itself. These studies of literary types—the epic, the lyric, the essay, the novel, the short story, and so on—may serve a useful purpose. Doubtless, scholars will soon present us with solid tomes on the origin and development of the ten-line anecdote and the joke of commerce. When those precious contributions to knowledge appear, we hope to welcome them suitably. To-day we merely take the publication of Professor Matthews's book as an occasion to remind our readers that the short story is not one of the highest forms of literary art.

That common delusion is fostered, in the first place, by our periodicals. All the popular magazines and newspapers print short stories; some of them print nothing else. Worthy people whose reading is confined to these tales—and beyond the stock-tables and the news dispatches, many persons apparently read nothing else—talk quite innocently of their fondness for literature, and imagine they are sustaining their minds on the best writing of our best writers. We have all met unsophisticated souls who speak of Richard Harding Davis, for example, as if he were Thackeray or Thomas Hardy. But the mistake is not confined to persons who are relatively illiterate. The enormous demand for stories containing between two thousand and ten thousand words has its effect on the minds of our professional authors. They see that a carefully composed novel may have but a small sale; that essays and poetry hardly pay their way; but that any literary craftsman can write with his left hand a short story that some magazine will buy. That is the wide gate that leadeth to fame, and many there be which go in thereat. Thus the fact that millions of people, incapable of sustained attention to a book, want literature in homœopathic doses, has robbed us of the power to judge this kind of hack-work on its merits. Successful manufacturers of short stories gravely talk to the newspaper interviewer about their "methods of composition," and allow their pictures to be displayed in the literary magazines, apparently under the impression that they belong to the hierarchy of great novelists and poets.

And some of our college teachers, we regret to say, have done their share in encouraging this folly. The theme-reader is always in danger of regarding his geese as swans; and when, after ploughing through thousands of pages of rubbish, he comes upon a theme which almost shows intelligence, he is likely to think it better than it really is. Now the short story is the kind of thing which bright freshmen and sophomores can produce; it requires less thinking than good exposition and argumentation; but it is often more entertaining. Hence we have the spectacle of undergraduates allowed, even instigated, to make their electives in composition courses in short-story writing. For the exceptional man the discipline may be profitable; but the majority of boys who indulge in this academic dissipation and of instructors who aid and abet them are the victims of self-deception. If the matter ended with college, little damage would be done. But aspiring youths, on the strength of their facility in carving cherry stones, sally forth to lead the literary life.

To all these misguided mortals—general readers, authors, teachers, and pupils—we commend Professor Matthews's book as a corrective. In spite of his own enthusiasm and his belief that this form of writing is "worthy of careful study," his admirably chosen specimens and his analytical introduction make it clear that with comparatively few exceptions the short story is milk for babes. He gives us, to be sure, some short stories which exhibit intellectual power and artistic skill. He shows that to observe all the limitations of this style is no small achievement. But, then, the number of flawless short stories, which may fairly rank high in literature, can almost be counted on the fingers. Boccaccio, for instance, is often held up as a great exemplar of the art of writing short stories; and yet, as Professor Matthews notes, Prof. C. S. Baldwin of Yale, after analyzing the hundred tales in the "Decameron," reaches the conclusion that over half are little more than anecdotes, and most of the remainder are but naked plots "ingeniously set forth, but existing only in scenario, so to speak." But three of Boccaccio's tales approximate the "true type of short story" and only two "actually attain to it." The difficulty with Boccaccio, Professor Matthews thinks, is that he had in mind "no definite standard" as to type and technique. Evidently, our learned professors have set up a norm as rigid as the three unities of classic drama.

Be that as it may, many modern practitioners are all technique. They have nothing to say, but they say it very well. They write short stories because—as Professor Matthews quotes from Prof. Bliss Perry—the short story does not require sustained imagination; it does not demand "essential sanity, breadth, and tolerance of view," or consistency, or ability to "think things through." In fine, though Professor Matthews would probably not go so far, the short story is the lowest type of imaginative literature. In ninety-nine cases out of a hundred it is nothing more than whipped syllabub—a pretty confection for young ladies who want to kill time. The next step down from the short story is into the depths of journalism—news stories, special articles for Sunday papers, reports of college lectures, and so on to the abyss of advertisements and editorials.

PARIS BOOK NOTES.

PARIS, January 24.

René Boylesve has been a rising novelist in France for some years. Perhaps he has not yet reached his final standing, which may be among the highest. For mere French, for language, and style, in the adequateness of words to thought for the reader's easy intelligence and pleasure, he is already one of the best. "Mon amour," his new novel, deals, of course, with the everlasting feminine. Louis Bertrand, a late comer, has done work that also makes one wonder if he is not the promised great romancer. His new book, "L'Invasion," has something in it beside the present universal obsession of sex, since it portrays the curious life of the Italians who are "invading" and all but transforming the great French seaport of Marseilles. For a best seller, Marcel Prévost still holds the first place. His new "Lettres à Françoise mariée" continue to the young wife the spiritual direction which began with the volume of letters to the same young lady, when unmarried—a volume now in its ninety-sixth edition. With the old upbringing, the average French mother would scarcely allow her daughter to read these samples of utmost worldly wisdom; and it is probable they are even now read mostly after marriage. It would be curious to know how many men in France read these books written by a man for women, just as it would be to know how many English and American men read the novels written for them by women. It is certain that this return of Marcel Prévost to his earlier field follows on the diminished sales of his later, more manly novels.

Abel Hermant, the somewhat cynical, but sparkling novelist of the decadent and cosmopolitan rich in European fashionable resorts, publishes the text of his successful play of 1907, "Monsieur de Courpière." Like most French plays, it is as interesting read as heard. This is also the case with the volume in which the veteran Catulle Mendès has gathered together all his prose plays, "Théâtre en prose," including the favorite "Femme de Tabarin."

In history good as a play, we have a final "Camille Desmoulins" by another veteran, Jules Claretie, who is not only director of the Comédie Française, but for fifty years has been pouring out literary pages inexhaustible. The French Revolution is a specialty of his; there was never anything more dramatic than Camille's starting off the Palais Royal crowd to storm the Bastille, more idyllic than his love for Lucille, more tragic than the death of both at the hands of leaders he had helped to create. M. Claretie is not only a popular writer and an Academician; he is one of the active founders of the working Society of the History of the French Revolution. A little book on a lighter side of those dark years, "Les Fêtes et les chants de la Révolution Française," by Jules Tiersot, is worthy of mention. So is a new volume, "Souvenirs du Baron de Frenilly, pair de France (1768-1828)," letting in contemporary light on a period whose every day is still a subject of passionate dispute; the introduction and notes are by the competent historian, Arthur Chuquet. I recently narrated Frédéric Masson's attempt to uproot the perhaps ineradicable story of Napoleon crowning himself in presence of a supposedly amazed Pope. M. Masson, who seems to have studied his idol hour by hour of his career, now publishes an entire volume on "Le Sacre et le couronnement de Napoléon." L. de Lanzac de Laborie gives us the fourth volume of his "Paris sous Napoléon" devoted entirely to religion. This work has received the highest distinction awarded to works of history in France—the Grand Prix Gobert of the French Academy and the Prix Berger of the Académie des Sciences Morales et Politiques. A handbook of more restricted interest, but perhaps more real importance to the historical students, is the "Précis élémentaire d'histoire du droit français" during the Revolution, Consulate, and Empire—the period when French, and Continental law in general, took on its present complexion. The author is the chief living authority in this legal field, A. Esmein, professor of the Paris Faculty. "La Chute de la République de Venise (1789-1797)" is an original and painstaking study of the fate of Old Venice as a "neutral state under the Revolution," by André Bonnefons. Three volumes of strictly military history of the final blow to Napoleon's Empire and the European enterprises of Revolutionary France are published by F. De Bas of the historic section of the General Staff of Holland and Count J. de T'serclaes de Woomersom, colonel of the Belgian General Staff—"La Campagne de 1815 aux Pays-Bas" from official documents and reports in the archives of the Netherlands. The first volume deals with Quatre Bras; the second with Waterloo; the third contains "annexes" and plans. A military study of that other fatal battle for France, fifty-five years later, leads to the wonderful cavalry charge which drew from the Prussian King at his post of observation the admiring cry: "Oh! the brave fellows!" "Les Régiments de la Division Margueritte et les charges à Sedan" is the work of Gen. Rozat de Mandres.

The step is easy to the new imperialisms, which have all at once and simultaneously started up in our civilization. Paul Adam gives one of his general surveys to the matter in "Les Impérialismes et la morale des peuples"—nineteen chapters aimed at all and sundry, from Kaiser Wilhelm and President Roosevelt to the "evolution of the Chinese." The fourth volume of Ernest Seillière's formidable "La Philosophie et l'impérialisme" is entirely given up to what the author calls the "irrational" variety, especially in that literary, play-actoring phase which gives its name to the volume, "Le Mal romantique." Like all this author's work, it is a mixture of lofty philosophical speculation, such as we might expect from his writings on Nietzsche and Gobineau. An appendix to such speculations is found in a very legal little book by a Paris doctor of laws, J. Laferrière—"Les Cas insulaires"; it treats of the most practical thing in Imperialism—the customs tariffs between the United States and their "extra-continental" possessions. A work of considerable importance on the archetypal Imperialist is brought to an end in the third volume (1870-1898) of Paul Matter's "Bismarck et son temps." This is the period of "triumph, splendor, decline"; the first volume dealt with the "preparation" (1815-1862); the second with "action" (1862-1870). The author is both a doctor of laws and a Paris magistrate, and made himself known in this field of history by a book on Prussia and the Revolution of 1848.

In French history which is all but archæology, we have "Les Arênes de Lutèce"—the ancient past, the modern exhumation, and the present of that Roman amphitheatre which has been almost too completely restored in the Rue Monge of present-day Paris. The author is the intelligent compiler F. Bournon. A complete work, which was waiting to be done, is "Le Château historique de Vincennes à travers les âges" by F. de Fossa, captain of artillery. This château, occupied as it is by the Paris garrison, is little inferior in general interest to the Tower of London, and is still quite as castle-like in appearance. The first volume of the work goes through all its royal history, from Blanche of Castille and St. Louis, Isabeau of Bavaria, Henry the Fifth of England (who died there) down to Mazarin and the last of the great days, to the sad time when Napoleon had the Duc d'Enghien shot beneath the walls. The second volume, which will appear in March, will contain monographs on the art and architecture of the Donjon; the buildings of the towers and walls encircling the château; and the chapel with its stained glass.

Alfred Franklin, chief of the anecdotic historians of Parisian life, after advancing well into his second score of volumes on the past, now contemplates the present city from a safe standpoint—"Les Ruines de Paris en 4908"—official and unpublished documents.

In the series "Monumentos Arquitectónicos de España," 21 fascicles have already appeared on Toledo and one on Granada. Each fascicle has 16 large pages with illustrations in the text and 3 inset plates, often in colors. French text is given along with the Spanish. The Italian director of Fine Arts, Corrado Ricci, is responsible for a moderately expensive work (100 francs), "La Divina Commedia di Dante Alighieri nell' Arte del Cinquecento," with 288 illustrations in the text and 67 inset plates, after Michelangelo, Raphael, Zuccari, Vasari, etc. Paul Eudel, than whom no man living has more multiple experience of the tricks of imitation in art, has a quite new volume (distinct from his former "Truquage") on "Trucs et Truqueurs" in antiquities, armor, autographs, jewels and gold work, banknotes, bronzes, terra cottas, marbles, ceramics, chasing and gilding, drawings, illuminations, miniatures, military equipments, engravings, stuffs, tapestry, laces, ex-libris, ivories, books, medals, coins—and postage stamps. S. D.

NEWS FOR BIBLIOPHILES.

At the sale of George M. Williamson's books by the Anderson Auction Company last Thursday the prices showed that desirable rare books in excellent condition have not depreciated in value on account of the business depression. The first editions of the books by the Brontë sisters, with one exception having interesting autograph letters inserted, sold as follows: "Wuthering Heights" and "Agnes Grey," 1847, cloth, uncut, $155; "The Tenant of Wildfell Hall," 1848, boards, uncut, with paper labels, $125; "Jane Eyre" (Mary Howitt's copy but without inserted matter), $90; "Shirley," 1849, cloth, uncut, $80; "Villette," 1853, cloth, uncut, $45; "The Professor," 1857, cloth, uncut, $27; the "Poems" of 1846, with the correct Aylott and Jones title-page, $101. Among the other sales are: Bryant's "Embargo," second edition, 1809, uncut, original paper wrapper, $55; the copy of "The Fountain and Other Poems," 1842, given by Bryant to Charles Dickens, with autograph inscription, $110; John Burroughs's first book, "Notes on Walt Whitman," 1867, with Burroughs's signature, $30; Lewis Carroll's "Alice's Adventures in Wonderland," 1865, the correct first edition, $315; Daniel's "Civile Wares," 1609, red morocco, by Lortic, $175; "Pickwick Papers," an unusually fine set in the original parts, $755; and the first one volume edition of "Sketches by Boz," in parts, with original pink wrappers, $380.

The prices paid for Mr. Williamson's first editions of Robert Louis Stevenson show that the interest in this author is still keen among collectors. Letters laid in several of the books greatly enhanced their value. "The Pentland Rising," Stevenson's first book, "printed by a fond parent," with an interesting letter inserted, brought $177.50. Not less than twenty copies were sold by order of the executors of Stevenson and his mother in April, 1899, bringing prices varying from £6 2s. 6d. to £9 10s. each. The thin pamphlet, "An Appeal to the clergy of the Church of Scotland," 1875, which had a presentation inscription, brought $80; the two early scientific pamphlets, "Notice of a New Form of Intermittent Light for Lighthouses," 1871, and "On the Thermal Influence of Forests," 1873, $35 and $31, respectively. Of the little leaflets printed by Stevenson and his step-son, Lloyd Osbourne, for amusement, in 1880, 1881, and 1882, the earliest known, Vol. I., No. 3, of *The Surprise*, San Francisco, 1880, went for $225. When sold in 1899 as the property of Stevenson's mother the price was £21 5s. The first series of "Moral Emblems," printed at Davos-Platz, brought $51; the second, $18; the two advertisements, $22 and $26; "Not I and Other Poems," the identical copy which was sold in 1899 for £22, $51; a printed sheet—a poem "To F. J. S."—sixteen lines, $81. A similar copy brought £7 in 1899. "To M. I. Stevenson [R. L. Stevenson's mother], Feb. 11, 1882, from R. L. Stevenson and S. L. Osbourne," a four-page leaflet about two inches square, having on page 2 a rude woodcut of a man admiring a daisy, and on page 3 "The Marguerite. Lawks! what a beautiful flower! T. S.," was bid up to $45. Several copies belonging to Stevenson's mother sold in 1899 at prices ranging from £1 18s. to £8. Several special, or imperfect, issues, got up for the purpose of securing copyright, went for good prices: "The Silverado Squatters," some leaves from the *Century*, with a specially printed cover, $65; "Macaire," an octavo pamphlet, with Heinemann's imprint, $25; "Kidnapped," with "Published for the Auther" on title, $115; "The Master of Ballantræ," presented by Charles Scribner to Mr. Foote, $100; "The South Seas," 1890, one of twenty-two copies printed and mostly cut up for distribution among a syndicate of newspapers, $150; and "Weir of Hermiston," 1896, one of six printed, $90. Presentation copies of first editions sold as follows: "An Inland Voyage," 1878, $155; "Edinburgh," 1889, $31; "New Arabian Nights," 1882, $32; "A Child's Garden of Verses," 1885, $71; and "Underwoods," 1887, $55.

While the auction sale of Crispi's library, of which mention was made in the *Nation* of November 21, cannot have proved altogether disappointing to the impecunious Crispi heirs, it certainly was a unique opportunity for the libraries which figured among the principal purchasers, the National Victor Emanuel Library of Rome, the Library of the Italian Ministry of Foreign Affairs, the New York Public Library, the Library of Princeton University, and the private Risorgimento library of an American resident in Rome. The total sales, which covered a period of four weeks and comprised 3,500 numbers, netted only 15,200 lire, a very inconsiderable sum, indicative of the utter want of enterprise and organization which characterizes the second-hand book trade in Italy to-day. The sale was conducted by Nardecchia, who is perhaps the best of Italy's second-hand booksellers; and had it not been for his personal purchases and the discreet bidding of the few American libraries represented, the total receipts would have been much lower; in fact, the sale would hardly have been possible. Rare works for dilettante bibliophiles were few, for the collection had been made for the practical use of a student statesman; but the discriminating librarian found innumerable bargains in works of history, diplomacy, jurisprudence, and statistics, at a fourth or a fifth of the prices ordinarily paid by the American library to its German or French agent. The most interesting sale was that of a set of secret documents upon Italy's African affairs; they had been printed for the private use of the Ministry of Foreign Affairs, in an edition of only twenty copies, one of which had been inadvertently left in Crispi's library. Among the documents were some which in the changed attitude of Italy's present foreign policy, would give umbrage to a friendly Power—Russia. By good luck the embassies in Rome were ignorant of the sale of the documents, and they were bid in excitedly by the Italian Ministry of Foreign Affairs at 1,150 lire. A copy of the privately printed edition of the works of Felice Cavallotti in six volumes, with the autograph dedication, "A Francesco Crispi con Affetto vivissimo perenne, Felice Cavallotti," was bought by the Victor Emanuel Library for 80 lire; it is of peculiar interest in view of Cavallotti's later implacable enmity for Crispi. Unpublished autograph letters of Guerrazzi, in part hostile to Crispi, were bid in for the private library of an American resident in Rome, as were practically all the pamphlets of the sale—say 20,000—and an invaluable manuscript volume of biographical notices of the Sicilian patriots who suffered for the national Italian cause from 1848 to 1860, a volume prepared for the Italian pension commission of 1883. Between the pages of many pamphlets were found manuscript documents and notes of Crispi, while the pamphlets themselves form a unique collection. An almost complete set of the Atti del Parlamento Italiano, which ordinarily brings from 3,000 to 5,000 lire, was withdrawn from the sale by the heirs, as bidding upon it reached only 300 lire. The private purchases of sections of the library not included in the sale, made by the Italian government and by a benefactor of the Palermo Library, amounted to 22,000 lire, so that the entire Crispi library, for which 60,000 lire had been asked privately, brought only 37,200 lire. Crispi's papers, valued at 200,000 lire, remain to be sold, but will probably be disposed of privately to the Italian government.

On February 13 and 14 the Anderson Auction Co. sells the collection of Charles Beldon Van Nostrand, with some additions. Among first editions are "Paradise Regained," 1671; Bacon's "Henry Seventh," 1622; "Mémoires de la vie privée de Benjamin Franklin," 1791, the first edition of the "Autobiography"; Browning's "Paracelsus," 1835, with corrections by the author; Mrs. Browning's "Seraphim and Other Poems," 1838, presentation copy; Byron's "Hours of Idleness," 1807; Coleridge's first publication, "The Fall of Robespierre," 1794; Gray's "Odes," Strawberry Hill, 1757; Rossetti's *The Germ*, 1850, in the original numbers; Shelley's "St. Irvyne," 1811; and Thackeray's "Book of Snobs," 1848. Of American authors there are first editions of Emerson, Holmes, Hawthorne, Longfellow, and Whittier. A fine and complete set of that great collection of voyages, "Hakluytus Posthumus, or Purchas His Pilgrimes," 1625-26, 5 vols., folio, is probably the most valuable lot. The catalogue includes also a remarkable series of books and letters relating to Christian Science and Mrs. Eddy; publications of the Grolier Club and various private presses, and books illustrated by Cruikshank.

Correspondence.

A WORD FOR OUIDA.

To the Editor of The Nation:

SIR: May I express through your columns a word of regret for Ouida? I do not mean for the poor woman who is said to have died in loneliness, but for the writer of one great story, and for the creator of one great character. Most people of "culture," I imagine, indiscriminately lump Ouida with Marie Corelli, Edna Lyall, Hall Caine, and the Duchess. Or else, if they have read her at all, their only recollection is of her snobbery, of her vulgarity, and of her beautiful, impossible guardsmen, with their "infinitely weary eyes," their "courtly grace," and of their "bows that are known in throne rooms." They may recall, too, her absurd belief in the power of Race, which works arbitrarily, making it impossible for one brother to do anything dishonorable, even if he should wish to, while the story hangs on the other brother's dishonor, notwithstanding his "Order"!

The great character is, of course, Cigarette, in "Under Two Flags." In her way she is as much of a creation as Sairey Gamp or Mr. Dooley. She is immensely vitalized—a living, breathing creature. She blows like a breeze through the absurd artificiality of the book. The very night before I read of Ouida's death I chanced upon the volume in a country hotel, and, I protest, that when I read of Cigarette's dying in the arms of Cecil, pierced by the bullets which were meant for him, I shed tears, as I have shed them twenty times before.

The great story is, of course, "Wanda." It is melodrama, but then all our great writers have written melodrama at the time when the blood has run reddest through their books. When Roy Richmond poses as an equestrian statue, deceiving the prince's court until he is startled into life by the unexpected appearance of his little boy, George Meredith is writing melodrama, if it is not farce. When Newman, in "The American," stops the old Marquise and her son in a Paris garden and hisses into her ear: "You killed your husband," while the Marquis's eyes scintillate like "little globules of ice"—I wonder how it was done! —dear Henry James is giving us rattling good melodrama. Ouida's melodrama is often cheap and meretricious—almost as meretricious as her virginal simplicity in "Two Little Wooden Shoes"—but in "Wanda" the melodrama rings true to the best traditions. Of course, she introduces you to the best society; in fact, it is almost as good as Mrs. Humphry Ward's. Wanda is the feudal chatelaine of an Austrian domain which even the Emperor cannot enter without permission. Her lover appears on the scene masquerading as the Marquis de Sabran, though he is actually only the bastard son of a Russian prince and a Russian peasant. But, gracious! what an accomplished man! His scientific work on Mexico is the despair of the scholars of Europe; he can paint like Meissonier; he can play with the best of them ("We never have such music," murmurs Wanda in her private salon, "save when Liszt passes this way"); he can make an oration as good as Pericles'. Of course, these fine people never travel except by special train, and subsist mainly on truffles and tokay. But in combination with others, they appear in magnificent situations, splendidly conceived, and splendidly worked out. Ouida has no humor but plenty of epigram. "He betrayed me; how, matters nothing," says Wanda to her old aunt when she has discovered her husband's deception. We use it as a family phrase. Psychologically, too, the story is satisfactory. Sabran's love for Wanda is genuine, even though he marries her under false pretences, and in the end this love works out his regeneration. The dominant note of Wanda's character is pride of race, which makes it impossible for her to consider the many extenuating circumstances, and postpones her forgiveness until a reconciliation is worked out through the medium of their little son, whose life the father saves at the cost of his own.

There are a dozen novels that abundantly reconcile me to growing older. It is a joy suddenly to remember that one has not read "David Copperfield" for five years; or "Henry Esmond" or "Richard Feverel." Among this dozen I put "Wanda," and if my taste be questioned, my answer is that I glory in my shame.

Some years ago there came out in *Lippincott's* a study called "The Truth About Ouida," which seemed to me to hit the nail on the head. I hope it may be republished, for I fear that otherwise this interesting writer will not be accorded critical consideration. FREDERICK JONES BLISS.

Clifton Springs, N. Y., January 30.

To the Editor of The Nation:

SIR: Your editorial of this week upon Ouida's work brings up again a point which, in my opinion, has been far too much neglected. Notwithstanding the prevalent hankering among novel readers for racy stories of pornographic savour, I am surprised that only one side of Ouida's work is recognized; because critics are supposed not to follow the herd in their notions about books. There is, I understand, a certain American writer of prominence who, in his capacity of despotic adviser to the public library of his city, has for years refused to have a single one of Ouida's volumes bought. His practice, which I believe is the result of ignorance on his part, keeps from a large body of readers some of the best stories for children in our tongue, as well as four novels which offer the best extant account of the Tuscan and Roman peasant, and of the region of central Italy. With the exception of Renato Fucini's classics and of a few masterly descriptive pages in such of Crawford's Italian novels, as "Whosoever Shall Offend," I cannot recall anything so minutely accurate, anything that shows so truly an inner understanding of a complex temperament as Ouida's descriptions of peasant life. As a landscapist, too, she excels in well nigh perfect visualizations of those magic, bell-towered distances. The four books that deal with this are "The Tower of Taddeo," "In Maremma," "Signa," and "Pascarel." Of these the last is probably the best known; but not one in two hundred of those who have read Ouida ever heard of these novels, which, by the firm but sympathetic use of excision, might justly be termed masterpieces.

The reason for this excellence is not far to seek. Whatever may be brought against Ouida—and there is much—no one can assert that her knowledge of the Tuscan peasants at home, a knowledge gained by long intimacy and a love for all the countless details of their lives, their joys and sorrows and strivings, in that setting of beauty which has made poets out of all who come to know—that this knowledge is not complete. Certainly it far outweighs her fancied understanding of fast society life in London. Furthermore, she hated the one and loved the other. All her vices of lurid phrasing and tortuous mouthings—later carried to a logical extreme in the work of that archdecadent and esthete D'Annunzio—are found in greatest excess in her "society" tales. But in the four novels just cited we find less pyrotechnic revelry in verbiage. The melodrama which taints so many of her pages is largely absent from these Italian chapters. Let us, then, give her credit for what is her just due, rather than heap abuse upon what she herself knew was a mass of "pot-boilers." It is probable that Ouida's descriptions of her beloved Tuscany and its Tus-

cans will persist far beyond "Syrlin" or the other works of bathos, by which the present "six-women" class of readers know her.

Ithaca, N. Y., January 31.

YELLOW CRITICISM.

TO THE EDITOR OF THE NATION:

SIR: There is a popular old definition of a critic as an unsuccessful poet or novelist who is anxious to punish his rivals for their success. Assuming that this is true, we should expect the prevailing color of criticism to be a sort of robin's egg green, in some lights bordering on blue. Any one approaching current American criticism with such an expectation would be disappointed. The blue has been completely washed out by the rising tide of our national "optimism," or self-complacency, leaving, as might be expected, a vivid and flaring yellow. The popular modern critic will condescend to no degree below the superlative. If he writes a sketch of a French artist, he will entitle it "The Greatest Force in French Painting To-day"; if of a composer, the headline will read "The Most Versatile Musician of Our Time," or "One of the Music Monarchs of All Time." Browning cannot be mentioned without being branded as "of all British poets the most truly original." If our critic wishes to speak of the Elizabethan era, he will call it "the greatest period of the greatest literature on the planet." After all, this is qualified and grudging praise. Why not say "in the Galaxy"?

Victor Hugo, I suppose, is the originator of this method of superlatives in criticism, and his book on Shakespeare is still the masterpiece of the superlative school. It should immediately be added that Mr. Swinburne runs Hugo a close second, sometimes galling his kibe. But of course our yellow critics can never hope to rival Mr. Swinburne. He has this decisive advantage over them: the utmost that their imagination can compass is only a double or triple superlative, whereas to him these things are matters of everyday commonplace. When he wishes to give genuine praise, he can raise the superlative, apparently without effort, to the nth power. Imagine his restricting the supremacy of Elizabethan literature to this paltry planet! Heavens! has our criticism not outgrown the Ptolemaic astronomy?

The method of superlatives is by no means the sole resource of our critics. It may strike the reader with admiration, but after all it requires no particular ingenuity or skill. Other more intellectual methods are often used in connection with it. Notable among these is what I shall call the method of poetical calculus. Through this our critics arrive with surprising certainty at the solution of apparently insoluble literary problems. Through this they can tell what would have been the accomplishment of Chatterton, if he had lived, say, to the age of ninety. Through this invaluable method a critic whom I have quoted is enabled to say of Keats: "Had he lived one-half as long as the great Scotchman (Carlyle), he might have surpassed all other British poets except Shakespeare." This gentleman, as I have remarked, is unusually cautious. We have seen that he limits the sovereignty of Elizabethan literature to this planet. You will note that here he excepts Shakespeare. He also spoils the beauty of his calculation by introducing that timid word *might*. This unfortunate hesitancy almost reduces his dictum to the uncertainty of a doctor's thesis not long since accepted by a great university; a thesis which showed that Chaucer *might* have read an old French story on which he *might* have based his Squire's Tale, that "story of Cambuscan bold"; and showed further how the tale *might* have ended, if Chaucer had finished it.

These methods are highly effective; yet even a well-trained public will weary of them in time. The more advanced yellow critic therefore borrows from the armory of his cousin, the yellow reporter. If he can uncover no literary scandal, he creates one by magnifying some literary indiscretion. If an English critic in an unguarded moment admits that he thinks Adam Bede "mighty dull," you will find his skit reviewed under the title "George Eliot's Fame Imperilled." If poor Tolstoy in his old age unwarily confesses that he doesn't like Shakespeare, and is childish enough to try to justify his dislike in a pamphlet, the yellow critic will discuss the affair in one issue of his magazine under the title, "A Critical Onslaught on Shakespeare," and in the next issue you will be relieved to find under the heading "Shakespeare Universally Vindicated" that the tottering reputation of the Bard of Avon has been saved by the timely props of a horde of criticasters. Several recent books on Shakespeare by scholars of recognized authority will be represented as answers to Tolstoy, whereas not one of their authors has thought Tolstoy's "onslaught" worth mentioning.

To enliven and heighten his style, our critic will employ various devices; some old, such as alliteration and mixed metaphor, some more modern, such as allusion to the "New Thought" and the "New Psychology." He will tell of an author's "protracted plunges into the dark pools of his subliminal self." He will gracefully allude to "love episodes in diaphanous keys." Consider the alliteration and the lightning changes of metaphor displayed here: "Vanished, the velvety rhetoric, the musical phrase, the nervous prose of many facets." In a sentence like the following, the imagination almost shakes off the fetters of prose:

> In his fugue-like flights down the corridors of his metaphysics he never neglects to drop some poetic rose, some precious pearl of sentiment.

It is clear that the line between criticism and lyric poetry can no longer be drawn with definiteness. At last criticism has risen to the rank of a fine art.

Yet here and there will be found some old-fashioned heads that are bewildered by this new yellow brilliance; that are inclined to echo the exclamation of Douglas Jerrold when he tried to read "Sordello," "Good God! am I losing my mind?" Out of the depths of their confusion such may even cry out: "Give us men who mean something and can say it; give us Dr. Johnson or Jeffrey: give us even Gifford!"
HOMER E. WOODBRIDGE.

Colorado Springs, January 23.

ETHICS OF EDITORSHIP.

TO THE EDITOR OF THE NATION:

SIR: Discussion of the relative rights of author and editor seems to be in the air just now. The following case is respectfully presented:

A man who has never written for the magazines, but has some reputation among scholars in a special line, comes across a matter in his field which has wide public interest. He spends several weeks in collecting facts, condenses material enough for a volume into a carefully considered magazine article, makes a set of accurately drawn maps to illustrate it, and sends it to a first-class periodical. The editors offer him a sum which they admit is ridiculous for the work involved, but is all the magazine can afford. He accepts because he prefers that medium to a cheaper magazine which can pay more. He is told that the article will appear in a certain number, that he will be consulted during the making of the plates for the maps, and of course, he expects to read the proof. As the time approaches for publication, hearing nothing from the editors he goes to see what has happened, and finds that the pages are already stereotyped, that the maps contain some inaccuracies, that the titles given them are misleading, and, finally, that the whole article has been cut down to a mere commentary on the maps, which any space writer could have produced, giving no hint of the processes by which the somewhat striking results have been obtained. The sub-editor with whom he deals says that Mr. Jorkins, the editor-in-chief, would allow only a certain number of pages, and that after the maps were engraved there was no room for any more text. As the article appears, it does not represent the author fairly, either as a writer or a scholar, and yet, with his name printed at the head, he must be judged by this publication as it appears.

A parallel case would be that of an artist who has painted an historical ensemble with a group of girls in the foreground, showing by look and attitude the importance of events which are represented elsewhere in smaller perspective. He sells it to a dealer who has a handsome frame too small for it, on account of which he cuts out the group, puts it in the frame, gives it a fancy name, and exhibits it for sale. Of course, neither the artist nor the author has any legal redress, but both can justly appeal indignantly to their fellow-craftsmen, and perhaps even the public can see the injustice to which they have been subjected.
HEZEKIAH BEERS.

New York, January 31.

Notes.

Dr. George M. Gould of Philadelphia, has a book "Concerning Lafcadio Hearn" soon to be published by George W. Jacobs & Co. Dr. Gould was an intimate friend of Hearn's, and in recent magazine articles has attempted to attribute most of that writer's peculiarities of temperament to his abnormal eyesight.

Longmans, Green & Co. announce that volumes III. and IV. of the late Sir Spencer Walpole's "History of Twenty-five Years" is now in the press. These volumes complete the work, bringing it down to the year 1881.

A. C. McClurg & Co. have the following titles on their spring list: "Men Who Sell Things," a book for travelling salesmen, by Walter D. Moody; "My Day and Generation," by Clark E. Carr; "An American Student in France," by Abbé Félix Klein; and "The Art of Retouching Systematized," by Ida Lynch Hower.

Miss Elfrida Everhart, reference librarian of the Carnegie Library of Atlanta, and instructor in the Southern Library School, has completed the manuscript of what should prove to be an exceptionally useful and valuable library tool—a "Handbook to United States Public Documents." The Handbook will probably appear some time in the spring.

G. P. Putnam's Sons have issued a revised and enlarged edition of "Tabular Views of Universal History," originally compiled by George Palmer Putnam, and continued to the year 1907 by Lynds E. Jones and Simeon Strunsky successively. The volume presents a chronological arrangement of contemporaneous events in a double page of four to eight parallel columns, and is well adapted for ready reference. So far as we have tested the dates for various periods we find no reason to doubt the general accuracy of the book. In the matter of proportion, the last fifty years receive possibly more space than they deserve. Overemphasis of the present, however, has its use, and can always be remedied in future editions.

The John Lane Company sends us two books on Napoleon: "Napoleon and the Invasion of England, the Story of the Great Terror," by H. F. B. Wheeler and A. M. Broadley, two volumes, with numerous illustrations; and "Napoleon at the Boulogne Camp," based on hitherto unpublished documents, by Fernand Nicolay. The historical incident dealt with possesses this distinctive character, that it was not so much an event as a projected event. The interest lies not in battles, treaties, and conquests, but in plans, in popular emotions, in what-might-have-beens. Was Napoleon to repeat the great achievement of William the Conqueror?—This was really the question that haunted the imaginations of the people of France and England for nearly ten years. And so, when dealing with these years, the historian of necessity turns less to military and diplomatic passages that all came to nothing, and more to the evidence that shows how the public of France and England thought, felt, and acted while under such an impression. The great value of Messrs. Wheeler and Broadley's handsome volumes is that they bring together a great deal of miscellaneous material, caricatures, broadsides, proclamations, private letters, important historical manuscripts, popular ballads, that paint, as nothing else does, the national psychology of England at this moment of pressing danger. They fill a gap in English historical literature and may be heartily recommended. At the same time it must be said that the authors are more collectors than historians, enthusiasts than stylists; their own share of the book is occasionally slipshod and is not marked by the historical sense. Far less important and interesting is M. Nicolay's book, which gives us, in part, the other side of the picture. The anecdotes he has strung together relating to Napoleon's sojourn at the camp of Boulogne are not always entertaining, or vital, or even plausible. The effect, on the whole, is somewhat local, and patchy, and, moreover, suffers from translation. A placing together of the two books, however, serves to emphasize in striking manner the contrast presented by the two sides of the Channel at this moment; on one side a truly national movement, as strong in individual initiative, and in patriotic emotion, as it was weak in organization and executive power; on the other, one man, playing on dramatic and military instincts, with little public opinion to support him, yet creating a great machine wherewith to divert the stream of history from its natural courses. England had Gillray and Rowlandson; while France had to put up with a muzzled press and distributions of the Legion of Honor.

We had occasion to call attention to the stuff offered the public by the Hindu who calls himself Mahatma A. Guru Paramahamsa, when he published his Brahma Dhara in 1905. He has now written another pretentious little book, adorned like the former with a portrait of the author (can it be that these vagrant wiseacres are still troubled with worldly vanity?), and called "The Land of Eternity." The volume may please those who like to think they are being indoctrinated into occult mysteries while they take afternoon tea (London: A. C. Fifield).

"A Personally Conducted Tour in the Holy Land" would be an appropriate subtitle for "To-day in Palestine" (New York: James Pott & Co.). It is substantially a reproduction in print of the information which the author, H. W. Dunning, gives to the parties whom he takes through the country, together with descriptions of the scenery and the present condition of the places visited. As the result of observations of ten journeys during the last fifteen years, he has a high opinion of the character and capabilities of the people. Drunkenness and idleness and "real immorality" in the villages "are almost unknown." Of their ruler, the phlegmatic Turk, he is fairly enthusiastic in his commendation. There is a brief summary of the history of Palestine, and the closing chapter contains some practical advice to intending travellers. In this and in the numerous similar hints scattered through the book its chief value lies. The want of an index detracts much from its usefulness as a book of reference.

Notwithstanding the fact that twenty years have elapsed since the appearance of the first numbers of the Cambridge Bible for Schools, the series is the best compact and practical commentary in English on the major portion of the Bible. The Rev. A. W. Streane, fellow of Corpus Christi College, Cambridge, is the author of the latest volume, "The Book of Esther" (G. P. Putnam's Sons). Dr. Streane has considerable difficulty in making Esther a Christian saint, and in defending the canonical authority of the book which bears her name, although he exhibits earnest desire to perform both these feats. He recognizes the "many heathen improprieties" which Luther declared the book contains, and which led both Athanasius and Gregory of Nazianzen to exclude it from the canon. He succeeds, however, in finding "a point of view whence profitably to regard a Book which, differing though it does in more than one striking respect from what we might *a priori* expect to find as a constituent part of Holy Writ, is yet, upon thoughtful and sympathetic consideration of its Jewish authorship, far from deserving to be excluded." This decision is to be regretted. With its bitter racial hatred, its substitution of political exclusiveness for religious enthusiasm, its glorification of direst vengeance, Esther is unworthy a place beside the nobler products of Hebrew genius. The eagerness of Dr. Streane to demonstrate the value of the book has betrayed him into mistaken praise of its "masterly sketches of character," as well as into exaggeration of the worth of its "vivid picture of life in the Persian court and royal harem." There are very serious difficulties in the way of the admission of Esther's description of Persian customs as true to fact. Dr. Streane attempts to maintain an intermediate view as to the historical trustworthiness of the book, that it is neither "in the fullest sense historical" nor "wholly fictitious," but contains "an element of romance," resting upon a "veritable historical basis." Yet in his consideration of details one finds very little of the material apportioned to "romance," and much more ascribed to history than is supported by sufficient authority.

Attention should be called to the fifth number of the series entitled Old-Latin Biblical Texts, in which the eminent Vulgate scholars, the Bishop of Salisbury, Canon Sanday, and Dr. White are engaged. This number consists of "an exact print, line for line and column for column," of the whole Codex Corbeiensis, a gospel codex to which the date 375-425 A. D. is here assigned; and of "fragments of the Catholic Epistles, of the Acts, and of the Apocalypse from the Fleury Palimpsest." The editor is E. S. Buchanan, and the publisher The Clarendon Press. (New York: Henry Frowde.)

One who turns to the latest volume of Dr. A. S. Crapsey, "The Re-birth of Religion" (New York: John Lane Co.), with the idea of finding an exposition and defence of the doctrines for which he suffered expulsion from the Episcopal Church, will be somewhat disappointed. The Virgin Birth and the Resurrection of Jesus are not considered at any length, but the attempt is made to show that the conceptions underlying current dogma in all the churches have passed away, leaving the way open for spiritual religion of greater beauty and power. One might call the treatise a popular essay on the history of dogma and a discussion of the present outlook for faith. It is perhaps safe to say that if Dr. Crapsey had confined himself to addresses of this sort, he would not have lost his surplice. Very little is found in these pages which is not often heard, in somewhat less piquant style, from the more liberal pulpits of the orthodox churches.

"Was ist Christentum?" is the title of a collection of investigations of leading problems of Christianity in its relation to modern thought, prepared by a dozen representatives of conservative theology, mostly university men, and edited by Pastor Cremer of Rehme. The publisher is C. Bertelsmann, Gütersloh.

Vandenhoeck & Ruprecht, Göttingen, announce as forthcoming "Hauptprobleme der Gnosis," by Prof. W. Bousset of the University of Göttingen. This will be the tenth volume of the series known as Forschungen zur Religion und Literatur des Alten und Neuen Testaments, edited by Bousset, in conjunction with Prof. H. Gunkel of Giessen. Another work from the same publisher will be the first instalment of a "Septuaginta-Grammatik." by Prof. R. Helbing of Karlsruhe.

The twenty-sixth volume of that standard bibliography, Theologische Jahresbericht, covering the year 1906, is now appearing under the editorial management of Prof. Gustav Krüger and Walther Köhler of Giessen (Leipzig: M. Heinsius Nachfolger). It appears in parts, each division or subdivision being in the hands of one or more specialists. The recent additions are on Vorderasiatische Literatur und ausserbiblische Religionsgeschichte, Old Testament and New Testament.

The Hague Association for the Defence of Christianity, which annually offers a prize for essays on current problems, has announced as the leading theme for the present year: "The Scientific Examination of the Uniqueness and the Significance of Christianity in the Light of the History of Religions." The prize is 400 gulden. Scholars of all nations may compete. Details may be obtained from Prof. T. Cannegieter in Utrecht.

"A Dictionary of the English and Dano-Norwegian Languages," by John Brynildsen, the Danisms supervised by Johannes Magnussen, the English pronunciation by Otto Jespersen (2 volumes, 727 and 1,150 pages), is issued by the Gyldendal Publishing Co., Copenhagen and Chicago. This work, which has been about ten years in preparation (the first volume was published in 1902), has just been completed. The author, who is a professor of the English language in the Naval Academy of Norway, is known as author of an excellent Norwegian-English dictionary, and as editor of the second edition of Geelmuyden's "English-Norwegian Dictionary." Professor Brynildsen has had particularly in view modern English interests, technical words he has treated quite exhaustively; and he gives some attention to earlier authors like Spenser, Shakespeare, and Milton. He has also defined some colloquial words. Take, for instance, "yegg," which is now common in the columns of even the better American newspapers. You will search in vain Webster's or the "Century" or the "Standard" for it. Brynildsen's has it, with the information that according to *Everybody's Magazine*, September, 1904, the word is derived from the name of John Yegg, a Swedish safe-breaker. The addenda are largely made up of Americanisms. The work may be thoroughly recommended to anybody interested in the study of Danish and Norwegian.

Dr. D. Macdonald, who has written much on Polynesian languages, gives the final results of his investigations in "The Oceanic Languages: Their Grammatical Structure, Vocabulary, and Origin" (Henry Frowde). The main part of the volume is a dictionary of the language of Efate, a member of the New Hebrides group—a welcome companion volume to Tregear's Maori-Polynesian dictionary; to this is prefixed a comparative grammar of the Melanesian and Polynesian dialects, with what the author regards as evidence of their Arabian origin. It is, he adds, a unique unveiling of the linguistic, mental, religious, and moral life of these peoples. He bases his theory of the Semitic character of the Polynesian tongues on alleged lexicographical and structural identities. The first of these classes of resemblances amounts to nothing; striking similarities in words may be discovered in any groups of languages. Structural agreements are more important, and Dr. Macdonald undertakes to show that the Oceanic languages have triliteral stems, indicate modifications of meaning by internal vowel-changes, and employ common Semitic prefixes with Semitic meanings. The facts, however, do not sustain his hypothesis. The Polynesian tongues are polysyllabic, but not triliteral in the Semitic sense; there are internal vowel differences, but these do not carry different shades of meaning in the manner of the Semitic languages; prefixes, such as *ma, ta*, are used to form derivatives from verbal stems, but this usage does not in itself prove Semitic relationship. What the linguistic facts warrant us in saying is that the Polynesian tongues employ structural material which is also employed in the Semitic languages; but the differences between the two groups in pronouns, numerals, and the inflection of verb-stems forbid the supposition of identity. The Polynesian languages deserve a more thorough grammatical study than has yet been given them.

For the edition of Bossuet's "Oraisons funèbres" in Putnam's dainty Classiques Français, René Doumic has provided a preface in which he shows gracefully and briefly why these funeral orations are still read while so many others are forgotten. The chief reason, he thinks, is that, in a *genre* where flattery and concealment rule by convention, Bossuet is not afraid of the facts. This is true, no doubt, but it is also true that the sheer eloquence and reverberation of Bossuet's language has much to do with the preservation of his work. To some it may seem that the coquettish green and gold covers of this edition are not so suitable to such eloquence as to Beaumarchais's sprightly dramas which preceded in the series. But we shall not subscribe to so captious a taste.

The editors of the promised Collected Correspondence of Giosue Carducci have shown little wisdom in putting out as a foretaste, loudly heralded, the volume, "Da un carteggio inedito di Giosue Carducci." It is a flagrant case of bookmaking, hardly to be expected from a publishing house which, although absorbed in a trust, still bears the name and professes to maintain the policy of Zanichelli, for many years the devoted publisher of Carducci. It contains but eighteen brief letters of the poet, written between July 18, 1897, and April 11, 1906, all addressed to the closest friend of his last years, Countess Silvia Baroni Semitecolo Pasolini. By means of large, widely leaded type, many blank pages, a few reproductions of photographs, and a mediocre preface upon Carducci and the Romagna by Antonio Messeri, these eighteen letters, of less than two hundred words each, are made to fill a volume of one hundred and eighty-one pages, which is placed on sale at three lire. Nor are the letters of great importance; written during a decade of rapidly declining health, the greater number dictated, they but faintly reflect the vast culture, the lofty ideality, or the polemical vigor of him whom his countrymen love to characterize, and justly, as the immortal poet of the Third Italy. The first letters relate to the restoration of the church at Polenta, where tradition would have it that Dante and Francesca once worshipped, and upon which Carducci wrote a classic ode. Another letter, the best of the eighteen, professes to give the writer's religious creed; in reality it makes no new confession; Carducci explains that he had frequently been led to declaim against Christ from hatred of the priests, then he simply reiterates his denial of Christ's divinity, at the same time "reverently inclining before the great martyr of humanity."

The National Society for the History of the Italian Risorgimento has issued a circular giving the regulations which are to govern its prize competition for popular biographies of Victor Emmanuel II., Garibaldi, Cavour, and Mazzini. The biographies, which may be written in any language, must not exceed one hundred and fifty pages octavo, and must be sent in before June 30 of the current year to the Istituto Lombardo di Scienze e Lettere, Palazzo Brera, Milan. The prize for the best biography of each of these four national characters is five hundred lire. The society will publish in Italian the volumes of the four successful competitors.

The University of Liverpool, which is always to the fore in the archæological field, has decided to add to its already considerable undertakings no less a task than the systematic survey and excavation of the whole of Wales and the Marches. The arrangements are to be carried out by a special committee, including not only well-known scholars such as Dr. Arthur J. Evans and Sir John Rhŷs, but influential Welshmen representative of every class and every shade of opinion both from Liverpool and the Principality. They expect to receive valuable aid from the University of Wales, the Cambrian Archæological Association, and other district or county societies. The actual operations will be directed by the heads of the Liverpool archæological department, Profs. Robert C. Bosanquet, G. Garstang, J. L. Myres, and P. E. Newberry, and Prof. Francis J. Haverfield of Oxford. On the importance of the work we need hardly lay stress. The historian will be disappointed, indeed, if this systematic exploration does not shed considerable light on the Pre-Celtic inhabitants, on the relation of the Silures to the Roman invaders, on the early British church, and other subjects still enveloped in obscurity. The expense will be heavy; the cost of digging out the ten Roman sites, for example, is estimated at £10,000. The committee hopes, however, to receive assistance from Welshmen on both sides of the Atlantic. An illustrated report of the work done will be presented yearly to annual subscribers of £2 2s. and upwards. Cheques should be paid to the treasurer, T. Rowland Hughes (North and South Wales Bank, Liverpool), and requests for information addressed to the organization secretary, Capt. A. O.

Vaughan (Owen Rhoscomy), No. 38 Bedford Street, North, Liverpool.

Definite announcement is made that the next annual conference of the American Library Association will be held at Lake Minnetonka, Minn., during the week beginning June 26, with headquarters at the Tonka Bay House. The place chosen is twenty miles from Minneapolis, and thirty miles from St. Paul. Topics to receive special attention on the programme are: "Losses of Books from Open Shelves" and "Books of the Year." In the discussion of the former of these, says the executive committee, an interesting debate is promised, and "advocates of the open-shelf system, which has been the object of so much reactionary criticism during the past year or two, will undoubtedly be put on their defence."

As the result of a resolution passed last autumn at the annual meeting of the Belgian Association of Librarians and Archivists, arrangements are now making for an international meeting at Brussels in 1910 in connection with the proposed international exposition.

Gustaf E. Karsten, head of the department of modern languages at the University of Illinois, died at Urbana, January 29. He was born in Germany in 1859, and studied at Leipzig, Königsberg, Heidelberg Tübingen, and Freiburg. After teaching at the University of Geneva, he became professor of the Germanic languages at the University of Indiana in 1886. Leaving the University of Indiana in 1904, he was connected successively with Cornell and Northwestern University. In 1906 he was called to the University of Illinois. In 1896 he established the *Journal of Germanic Philology;* in 1903 it became the *Journal of English and Germanic Philology,* jointly edited by Professor Karsten and Prof. A. S. Cook of Yale. Professor Karsten was author of "Zu den altfranzösischen Konsonantenverbindungen," 1885.

Daniel C. Heath, head of the publishing house of D. C. Heath & Co., died at Newtonville, Mass., January 28. He was born in Salem, Me., sixty-four years ago, was graduated from Amherst, and was for a number of years junior member of the firm Ginn & Heath. In 1886 he established an independent business.

Ernst Hasse, professor of statistics and colonial policy in the University of Leipzig, director of the bureau of statistics in the same city, has just died, in his sixty-second year. Besides his activity as teacher and author he played an efficient rôle in politics and for a number of years represented the National Liberal party in the Reichstag. Among his books are "Die Stadt-Leipzig und ihre Umgebung," "Geschichte der Leipziger Messen," "Die Wohnungsverhältnisse der ärmeren Volksklassen in Leipzig," "Deutsche Weltpolitik," and "Kolonien und Kolonialpolitik."

The death, at the age of fifty-six, is announced of Felix O. Stoerk, professor of law in the University of Greifswald. Among his works are "Das Staats- und Verwaltungsrecht," "Völkerrecht," "Das internationale Privat- und Strafrecht," "Methodik des öffentlichen Rechts," and "Archiv für öffentliches Recht."

A STATESMAN OF THE OLD SCHOOL.

Life and Public Services of William Pitt Fessenden, United States Senator from Maine. By his son, Gen. Francis Fessenden. 2 vols. Boston: Houghton, Mifflin & Co. $5 net.

After William H. Seward resigned his seat as Senator to become Secretary of State in Lincoln's Cabinet, the leadership of the Senate resided chiefly in the hands of Fessenden of Maine, although Trumbull of Illinois was a possible competitor. The one became chairman of the Committee on Finance, and the other that of the Judiciary, places which they held as long as they remained Senators.

Fessenden was born in New Hampshire in 1806. It is recorded that Daniel Webster, a friend of his father (Gen. Samuel Fessenden), travelled twenty miles through a snow-storm in order to be present at his christening. He was baptized William Pitt, and in this instance the historic name never overweighted the bearer; for the American was like the Englishman in statesmanlike qualities, as well as in the stormy times that called for their exercise. Gen. Samuel Fessenden, a lawyer, was a Whig, who early became an Abolitionist. His son, who also followed the law, became a Whig, but he adhered to his party until Gen. Scott was nominated for President and defeated. Then came the Nebraska bill to repeal the Missouri Compromise, whereupon, in 1854, the anti-Nebraska Democrats in the Legislature of Maine joined the Whigs in electing him Senator of the United States. In that year the Republican party was born, and Fessenden was one of its leaders through the anti-slavery struggle, the civil war, and reconstruction. The records of these events are found only in part in the volumes before us, but what is lacking in the way of history is more than made good by private letters and memoranda of the Senator, giving us his inmost thoughts at critical periods and portraying his personality as no other hand could do. Gen. Francis Fessenden busied himself during the last ten years of his own life in bringing together the material for this biography; but, dying before the book was put into shape, he left the manuscript and data to his brother, James D. Fessenden, to whom we are indebted for the finishing touches. The arrangement of the matter is defective, but the matter itself is of the first class.

Fessenden entered the Senate just before the Nebraska bill passed. Modesty held him back from the debate until the night of the final vote. Then his Republican colleagues urged him to speak. He took the floor at one o'clock in the morning of March 4, 1854, "without preparation or memo. of any kind"; with what effect Charles Sumner testified in one of his private letters, saying:

> Fessenden's arrival in the Senate was like a reinforcement on a field of battle. Those who stood for freedom were no longer fourteen, but fifteen. He did not wait, but entered into the debate with all those resources which afterwards became so famous. Douglas, Cass, and Butler interrupted, only to be worsted by one who had just ridden into the lists. It could be found in the *Globe*, but the *Globe* could not picture the exciting scene, the Senator from Maine erect, firm, immovable as a jutting promontory against which the waves of the ocean tossed in a dissolving spray, there he stood. Not a Senator loving freedom who did not feel that on that day a champion had come.

The testimony of Douglas was even more emphatic. In a conversation with Senator Browning of Illinois on the characteristics of the leading statesmen whom he had known he said:

> Henry Clay was the most fascinating and Daniel Webster the most powerful orator, John C. Calhoun was the logician of the Senate, but William Pitt Fessenden is the readiest and ablest debater I have ever known.

This quotation is cited without reference to authority. Doubtless it is authentic, but one defect of the book is that letters are frequently quoted without mentioning the sources of the originals. Some are taken from J. S. Pike's "First Blows of the Civil War" without acknowledgement.

The fight on the Lecompton Constitution of Kansas was the great event in the Senate in 1858, and its most notable features were the speeches of Douglas and Fessenden. That of Douglas attracted most attention because he then turned against the Buchanan Administration. That of Fessenden was the greatest of his life and the greatest made on the Republican side of the chamber in that session, although Seward's was justly celebrated. To this supreme forensic effort the biographer gives too little praise; but the Senator knew that he had made a mark, for he was answered by the foremost Southern leader, Jefferson Davis.

Early in Fessenden's service he conceived a prejudice against Seward. The first expression of it is in a letter dated February 7, 1856. Speaking of the debate on the relations between the United States and Great Britain on the Nicaraguan question he says: "Everybody believes that Seward's speech was insincere." From that time he was ready to construe all doubtful points to Seward's disadvantage; and on one occasion he was only prevented from charging him in public debate with betrayal of Republican principles by the circumstance that Mason of Virginia got the floor away from him (I., p. 122). Afterwards he was glad that Mason had interfered. His suspicions of Seward were not allayed, but rather intensified by the course of the latter as a member of the Cabinet at the beginning of the civil war. At first Seward was light hearted and opposed to war before the strife came to blows. He manœuvred in an underhand way to procure the evacuation of Fort Sumter, and in consequence gained for himself a deal of unpopularity at the North; but there is no evidence that he hung back or was unfaithful to his chief after the fighting began. The suspicions that attached to him in the public mind were, however, shared by all the Republican Senators except the two from his own State.

After the battle of Fredericksburg the leaders of the Senate came to the conclusion that Seward was the man with the evil eye, whose presence in the Cabinet made everything go wrong. They attributed to him an influence over Lincoln which he did not possess, and held that success could never be attained by a government dominated by a man who was only half in earnest. This was true as a general principle, but until it was shown that Seward was that man, it lacked particular application. The Senatorial caucus, the appointment of a committee to wait upon the President and virtually to demand the resignation of Seward, have been told by Nicolay and Hay and elsewhere, but nowhere in so great detail as in this biography. Fessenden was a member of the committee, but not chairman of it, nor was he the originator of the movement. At the time, however, he wrote a complete account with his own hand, and the manuscript, printed verbatim, fills twenty-two pages of the book—largely new matter. Preston King, Senator from New York, told Seward what was brewing, and the latter sent his resignation to Lincoln before the committee reached the White House. Fessenden was convinced that the resignation would have been accepted, though reluctantly, by the President, had not Secretary Chase offered his resignation also. Chase did this because he had entered the Cabinet in the first place as an offset to Seward, to make a balance in politics, and he believed that if Seward were engineered out of the Cabinet the effect on the party as a whole would be bad, and that he (Chase) would be suspected as one of the engineers. Chase was regarded by the President, by the Senators, and by the public as indispensable, and when it became known that if Seward went, he would go also, nobody desired a change. Lincoln said that now, "as he had a pumpkin in both ends of his bag, he could ride easy." So he declined to accept either resignation, and he heard no more Senatorial grumbling about Seward's evil eye. Fessenden's manuscript, however, leaves the impression that Chase, Stanton, and Caleb Smith had been largely responsible for stirring up the bad feeling in the Senate toward Seward, and that when confronted by the committee in Lincoln's presence they failed to make good their statements. This view is confirmed, as regards Chase, by Nicolay and Hay.

When Fessenden became chairman of the Committee on Finance he was put at the laboring oar of the Senate. Not only the tax and tariff bills, but the loan and currency measures fell to his care. This was virtually new legislation, without precedent on this side of the water, requiring study from the ground up. But that was not the most trying task. The appropriation bills passed under his ken also—the separate Committee on Appropriations did not then exist. With the war and the enormous attendant expenditure, an eagle eye was needed to detect fraud and a resolute will to cut down expenses. All these duties were discharged by Fessenden with unfaltering industry, although he was never robust, and, as his letters to his family show, was frequently in feeble health. He opposed the legal tender bill by speech and vote, using the same arguments that Chase, as Chief Justice, afterwards used in declaring it unconstitutional. And when Chase resigned the Treasury portfolio, at the most critical and distressing period, Fessenden was constrained reluctantly to take it. He resisted the solicitations of the President and his colleagues in the Senate until it was plain that financial disaster would result from his refusal. He held the office with success from July, 1864, to March, 1865. In the meantime, he had been elected as Senator for a third term, and as the Treasury crisis was past, he resumed his old seat and his chairmanship of the Committee on Finance.

Graver tasks were before him, however, for he was made chairman of the Joint Committee on Reconstruction; and it fell to him to reconcile the conflicting views of President Johnson with those of the victorious Republican party, or, failing that, to frame and carry out a policy of reconstruction over Johnson's head. This part of the story is well told. The irony of fate has no more cruel chapter than the sequel to the narrative, which shows how the unselfish labors of a great man ended in estranging him from the party he had so long and faithfully served, and in lacerating his heartstrings by the rupture of cherished friendships. Andrew Johnson proved irreconcilable. Fessenden wrote the report of the Joint Committee on Reconstruction, and it was adopted. Then came the quarrel which resulted in impeachment by the House, a step which Fessenden strongly deprecated. As a member of the Senate, he voted not guilty; thus it came to pass that this preëminent patriot, who had spent himself in his country's service, and given three of his four sons to the Union army—one killed and another maimed for life—was classed by an infuriated majority of his own party as a traitor to the cause of freedom. Stanton, for whom he had fought successfully in stormy scenes in executive session, never spoke to him after the impeachment trial. Neal Dow wrote that it was a duty which he owed to his constituents to vote guilty anyhow, and Neal Dow was only one of thousands of ordinarily sane men who held that view. Fessenden replied scorchingly. A little later, seventy-two leading Republicans of Boston invited him to a public dinner, expressly to testify their appreciation of his courage and conscientiousness under circumstances of peculiar difficulty. He had always been averse to such demonstrations where he was the chief object of attention, and he declined this one, but he wrote a letter reviewing the impeachment trial, which is the best brief vindication of the "seven traitors" that has ever been printed. Probably nobody now living would dispute a single paragraph in this admirable paper.

Notwithstanding the fury with which he had been assailed by the press and politicians of his own State, Fessenden entered into the Grant-Seymour campaign of 1868 with his wonted vigor. He was needed. The Democrats had adopted a platform for paying off government bonds with greenbacks. The plausible arguments by which this scheme was supported needed the attention of a master of financial science and of forensic sarcasm. So complete was Fessenden's victory over the greenback orators that he drew the largest audiences that could be accommodated in the public halls of the State. His reconcilement to his people at the end of this campaign was so complete that he would probably have been reëlected to the Senate on the expiration of his term in 1871, if his life had been spared. But the incessant labors of fourteen years had told upon a constitution by no means strong. He succumbed to an illness apparently slight, and died August 31, 1869.

In this book some attention is paid to the mutual dislikes of Fessenden and Sumner. A newspaper interview with Sumner, of which Fessenden was the subject, was published in the Boston *Advertiser* of August 30, 1867. This was one of the earliest examples of that mode of communicating one's opinions to the public. Among other things Sumner said: "For several years he [Fessenden] has been very unkind to me, unaccountably so. I cannot comprehend it. Sometimes it seemed to me akin to insanity." Any failure to agree with Sumner was a sign of brain trouble. His biographer, E. L. Pierce, accused Fessenden of talking audibly in the Senate while Sumner was speaking, this charge being put forward as a mark of rudeness, and as something quite unusual among Senators. Gen. Francis Fessenden sought the testimony of contemporaries, and obtained from Senators Sherman, Trumbull, and Morrill strong testimony on the other side. Sherman went a little farther than the interrogatory required, and added that "Sumner was a profound egotist and expected every one to defer to his opinion." Morrill said that Fessenden never wrote letters or read newspapers in the Senate chamber, "but talking to near associates aloud was then, as it is now [1893], a common practice." Sumner and Fessenden were reconciled later, and the former pronounced a eulogy on the latter when his death was announced to the Senate.

It would be invidious to point out minor defects in this work, such as printing Fessenden's speech on the legal-tender bill at vol. I., page 295, immediately after Chase's resignation, June, 1864. The proper place is at the beginning of 1862. The portraiture of the subject of the narrative is successfully accomplished. It shows us a highly gifted man, of unfailing courage, dignity, and courtesy, of princely form and feature, and of spotless character, who was a light to the age in which he lived, and who should be accounted one of the immortals of his country's history.

CURRENT FICTION.

Sheaves. By E. F. Benson. New York: Doubleday, Page & Co.

The most mundane of Archbishop Benson's sons has written nothing better than this. By the temper rather than the method of his treatment he has given new life to an old story. The outcome of a marriage between the well-preserved woman and the man in his first youth is a famous crux of fiction. Mr. Benson's heroine has given her youth and beauty to a hopeless sot, with whom she drags out a dozen weary years, before his death releases her. She has endured the experience with a fortitude so deep-rooted that she appears to have come out of it almost unscathed. She wakes from it as from a long nightmare, her mind haunted with the horror of it, but her body unimpaired. Childless, she takes up her waking life alone, having attained the serenity of one who has consciously put youth behind. But youth will not "stay put"; it assails her in the person of a man seventeen years her junior. Their marriage, however, lacks nothing but parity of years, and except as her consciousness of the actual disparity obtrudes itself, they are absolutely happy. A son is born, and for a time the mother's cup runs over. But after the first wonder of it is past, she wakes to the fact that her triumphant joy finds but a faint echo in the father's heart. The sense of his youthfulness begins really to oppress her. At this point Mr. Benson proceeds, in a way, to beg the question by killing off the woman. For the question is not whether a man of twenty-four can be happy with a woman of forty-two, but what is going to happen later on. All along the road to seventy will they be lovers, a wedded pair, or simply an old woman with a more or less dutiful spouse? This is the knot which Mr. Benson cuts, in effect, if not by intention. But one is rather grateful to him for it. His way of taking off the wife is not so summary but that it tests adequately not only the husband's patience and devotion, but the depth of his love. Their relation is made perfect by suffering, and there is no tragedy in its earthly surcease.

Mr. Benson's treatment of this sober theme is without a touch of sombreness. The tone of the book is cheerful, and even merry. The boy-husband is of the class called "artistic," over whose total selfishness and irresponsibility lady novelists are prone to yearn. Yet he succeeds in being charming without being either a brute or a popinjay. His career as a Lohengrin who captures Belgravia, and a Tristan who causes a popular riot in Munich reminds one, to be sure, of the achievements of various other paper heroes of recent date. But one ought to be willing to forgive him, as one forgives the heroine for being the most successful dramatist of her day. These two persons are credible and admirable in more essential matters. There is not in either of them a trace of morbid self-consciousness. The man gives his voice to the world because the woman thinks it his duty; and is glad of his strength and buoyancy for her sake, as the woman is glad of her beauty and serenity for his. The thought of her death does not make them frantic, does not even rob them of laughter. Her sister, Lady Peggy, is a creation worthy of the author of "Dodo," a delightfully intense, humorous, Puck-like spirit, wresting joy from the most diverse activities, an ardent politician and mother's-club woman, a patroness of balls and soup-kitchens. A certain rural canon and his circle give scope for those broader "character" studies which your English novelist seems still bound to add, like a pinch of coarse salt, to the more delicate ingredients of his composition.

John o' Jamestown. By Vaughan Kester. New York: The McClure Co.

An excellent little book of the half-historic and adventurous, half love-story sort, good reading from cover to cover, properly enwrapped in local atmosphere, yet without inflated parade of seventeenth-century language or manners. It tells of the love of Richard Farraday for a young girl with royal blood in her veins, of the jealousies and conspiracies that send him off, a kidnapped prisoner, on the Susan Constant, with John Smith, destined as it turns out, to found Jamestown. The portrait of Smith is vividly painted by the hand of an enthusiast. As Christian soldier, as self-confident leader, as strong-willed, resourceful colonist, exposing none to hardships that he did not share, smiting the foes of the settlers and sparing his own, he appears in a heroic yet wholly human light.

The history of the Jamestown colony comes at a timely moment. The year's pilgrims to the lonely, grassy little island will find it of pleasurable and painful interest to fit into its setting the story of the landing, the fort-building, the crop-raising; of mutinies, treacheries, famine, and sufferings; of the wiles of Powhattan, the friendliness of Pocahontas, the hopes and despairs, and the final peace and prosperity that settled on the plantations. There, in 1645, Farraday writes the story, sitting on his own porch, smoking his own tobacco, and proudly relating that in the previous winter there had lain in their harbors at one time "twelve ships from England, a like number from Holland, and seven from New England."

When Kings Go Forth to Battle. By William Wallace Whitelock. Philadelphia: J. B. Lippincott Co.

This fanciful tale contains a king or two, but no battles or rumors of battles. There is some waving of swords, and now and then the report of a pistol is heard, but the casualties are few. The action takes place in a small German principality which may as well be nameless—it is not called Zenda. There are, curiously enough, rival claimants to the throne, the person who for the nonce wears the crown being the less worthy of the two. The other has disappeared, with a price upon his head. He remains, in fact, in the capital, in the disguise of a common soldier. Enter from different quarters two young Americans, male and female, who penetrate the prince's disguise, espouse his cause, and proceed at once to adjust the affairs of the realm. When we say that it falls to our hero to chastise king the first, and to deprive king the second of the object of his affections, the reader will not be at a loss to classify him. The lady who prefers a citizen to a king is really a sort of compatriot of both, being by descent a full-blooded countess. There seems to be an insatiable demand for this sort of literary confectionery, and we may cheerfully admit that the present commodity is palatable in its kind.

Janet of the Dunes. By Harriet T. Comstock. Boston: Little, Brown & Co.

"Quinton" is supposed to be a village on (or off?) the easterly shore of Long Island. Some years before the story opens its dunes have been discovered and made famous by a painter, with the usual result of invasion by the small fry of "art" and by the summer boarder who follows in their train. Janet has lived her seventeen years in the little settlement surrounding the life-saving station "across the bay." She passes as the daughter of Cap'n Billy of the life savers; but is really the fruit of an irregular connection between a native girl and a city man. The girl has strayed back home, and been married by the magnanimous Cap'n Billy, who is presently left with a girl-child to take care of. The story deals with her dangerous and concealed intimacy with a young painter, and its happy issue. The affair is capably, if a little stiffly, managed by the author. The innocent maid and her sophisticated lover are hardly conceived with sufficient vividness to lift them above the over-familiar types. But if we are to believe the preface, it was the writer's chief aim to give the flavor of native life and character upon that part of the coast. There is enough true sea charm in her descriptions to make one wish she had had the courage to celebrate her shore and her shore worthies without recourse to the form of fiction. But no doubt the difficulty would then have been to find a publisher.

The Cambridge History of English Literature. Edited by A. W. Ward and A. R. Waller. Vol. I.: From the Beginnings to the Cycles of Romance. New York: G. P. Putnam's Sons. $2.50 net.

It has, of course, long been recognized that any history of English literature which is to set forth satisfactorily the whole development from the earliest beginnings to the present must be coöperative. Indeed, even in the treatment of a special period, such as the Elizabethan or the Romantic, coöperation is a great help. The advantages are particularly evident in the era covered by the present volume, viz., the Middle Ages, when so large a share of the intellectual production found expression in Latin—that is, in a foreign language, with powerful traditions of its own and with literary forms alien to those of the vernacular. We may conceive of a literary historian who combines first-hand knowledge of the vast mass of theological and philosophical writings (to say nothing of the chronicles) of mediæval England, practically all in Latin, with the requisite grasp on the vernacular literature, but no such person has yet arisen; and we may doubt the value of a second-hand treatment of this, as of any other subject, where the writer is unable to verify statements of his authorities, as he can always do in the beaten road of the vernacular, even where he may not be a specialist in the particular *genre*.

The coöperative history of which we now have the first volume, fulfils, to a respectable degree, our expectations. It is a pity, however, that for so many chapters the editors have been unable to secure contributors of authority. As to this defect, the reader may convince himself by comparing, for instance, Henry Bradley's discussion of the changes in the language or Prof. W. P. Ker's chapter on the metrical romances with the work of less known contributors. On the other hand, actual errors of statement are few, and the critical literature, including that which has appeared in Germany and America, has generally been utilized. Another shortcoming, which reveals itself in consecutive reading, is the amount of overlapping. Encounters with "Sir Gawayne and the Grene Knight," for example, are too frequent. Furthermore, in successive chapters Prof. J. W. H. Atkins and Prof. W. Lewis Jones offer separate discussions of Layamon's "Brut," marked by material differences in conception—differences evidently due to the fact that Professor Atkins, one of the best-informed of all the contributors, is acquainted with Imelmann's essay (which proves that Layamon's original was by no means identical with the printed Wace), while Professor Jones is not. We may add that Professor Jones's chapter on the Arthurian Legend, though in point of style one of the most agreeable, shows serious weaknesses in dealing with the French romances, especially those in prose. The Vulgate "Queste," of course, does not belong to the "Early History" versions of the Grail story, and Robert de Boron's "Merlin" in its metrical as well as prose form, so far from being one of the "chief" of these versions, has practically nothing to do with the legend of the Holy Grail. In his account of the Tristan legend, Professor Jones seems unaware of the agreement among the principal authorities, to the effect that all the extant Tristan romances go back to one lost original—a French poem of the early twelfth century.

Of the chapters not already mentioned, Prof. Israel Gollancz's on the works of the author of "The Pearl" is among the most successful. He rightly upholds the autobiographical character of this poem. The chapters on the literature of the Anglo-Saxon period are sound, though undistinguished by originality. Prof. H. M. Chadwick's discussion of the Christian coloring of the "Beowulf" will be read, however, with interest. In the Middle English period, the division of the metrical romances between two contributors, destroys unity of view. Three chapters are devoted to Latin, from Gildas to Richard of Bury.

In conclusion, mention should be made of the excellent bibliography. We notice, however, several omissions: Prof. Lorenz Morsbach's discussion of the date of the "Beowulf" in the Nachrichten (1906) of the Göttingen Academy of Sciences, perhaps the most solid contribution that has been made to this subject; and Ernst Brugger's important articles on Arthurian matters, which have been appearing at intervals for several years past in the *Zeitschrift für französische Sprache und Literatur*. But on the whole, the bibliography is full and exact.

Die Sumerischen und Akkadischen Königsinschriften. Von F. Thureau-Dangin. Pp. 275. Leipzig: Hinrichs. 9 marks.

Behind the Semitic period of Babylonian history, which can now be traced back to about 3000 B. C., lies the so-called "Sumerian" or "Sumero-Akkadian" culture, which probably flourished as early as 4000 B. C. Although considerable material is now at our disposal for the study of this earlier substratum, it is unfortunately not of the kind that can enable us to reach a definite solution of such fundamental problems as the ethnic character of the Sumero-Akkadians and the language spoken by them. Recently, through the distinguished Prof. Eduard Meyer of the University of Berlin, some progress has been made towards a sharper differentiation between Sumerians and Semites in the Euphrates Valley. By a careful and most ingenious study of types and costumes depicted on the sculptured remains of ancient Babylonia—embodied in a monograph, "Semiten und Sumerier in Babylonien" (Berlin, 1906)—Professor Meyer has given us what appears to be a safe criterion for distinguishing not only between Sumerians and Semites, but, among the Semitic settlers, also between various types, as, *e. g.*, such as shave off the moustache and such as wear a full beard. The non-Semitic character of the Sumerian type may now be regarded as definitely established; and while the Sumerian problem which has engaged the attention of Assyriologists during the past quarter of a century cannot be regarded as fully solved until we also know much more as to the possible origin of the Sumerians, the purely archæological investigation of Professor Meyer has cleared the way for the linguistic puzzle. This latter is brought home to us by M. Thureau-Dangin's work, which represents the first attempt to furnish a translation of all the historical inscriptions at present known to us that either belong to the Sumerian period or are couched in Sumerian. The German translation is itself a translation of a French version published by Thureau-Dangin in 1906; but it supersedes the French as representing a new revision, besides containing a most useful index of proper names, prepared by a promising American Assyriologist, Dr. Stephen Langdon (a graduate of Columbia University and of the Union Theological Seminary), who has also embodied in this index a list of the chief votive objects and utensils mentioned in the inscriptions.

M. Thureau-Dangin is a leading authority in all that pertains to the inscriptions of the most ancient period of Babylonia. To him, next to the lamented Professor Amiaud of Paris, and to Prof. Peter Jensen of the University of Marburg, the progress made in the interpretation of this most difficult material is chiefly due, though it is only proper to add that other scholars, like Fritz Hommel, Zimmern, Hugo Winckler, and J. Dyneley Prince of Columbia University, have also contributed their share in clearing up difficulties. What Thureau-Dangin, therefore, gives us represents the best that is at present available, and it may be said at once that all reasonable doubts as to the real character of the Sumerian language have now been set at rest. As long as we were dependent for our knowledge of Sumerian upon late syllabaries prepared by the Semitic scribes of Babylonia and Assyria, and upon bilinguals that were likewise the work of late scribes, it was really a question whether the Sumerian was a genuine language or merely an ideographic and archaic method of writing Semitic Babylonian, since in these late and doctored texts, artificial devices of all kinds were introduced by the scribes to whom Sumerian had become a sacred script, intended largely for the eye, rather than for the ear. This artificiality it is the merit of the distinguished Prof. Joseph Halévy of Paris to have demonstrated in the face of the opposition of almost all Assyriologists; but the further contention of Halévy that *all* Sumerian is merely an archaic method of writing Babylonian, preserved in order to give to the literature a mysterious character, can no longer be upheld with the testimony of original and ancient texts before us in pure Sumerian. These texts offer such evidence of a real language as (a) the "phonetic" separation of syllables, as, *e. g.*, *nu-um-mal* for *numal*; (b) the interchange of signs in the writing of a word having the same phonetic value; and (c) the interchange of *ba, bi, ib, ab,* and *ba-ab*. Such phenomena can only occur in a real language, and not in an artificially devised script, though, on the other hand, it must be admitted that, from being a real language, Sumerian degenerated in the course of long ages—as a sacred and only partly understood speech—into a mere script. The genuine Sumerian is represented by the texts in Thureau-Dangin's volume and by the numerous business records—largely dealing with the affairs of temples—of the Ur and other early dynasties. This question, however, of the *character* of the Sumerian language is still unsolved. All that can safely be said is that it is non-Semitic, and appears to have some affinities with Turkish—not sufficient, however, for warranting us in classing Sumerian with the Altaic group of languages. Scholars are now in a much better position, thanks to this new work of Thureau-Dangin, to study the peculiarities of the language, and it is a reasonable hope that the next decade will see the definite solution of this extremely complicated linguistic problem.

The material in this volume comes chiefly from Tello, where excavations were carried on by the Frenchman de Sarzec, from 1877 to his death, in 1900, and since then by Capt. Croz. The excavations conducted by Messrs. Peters and Haynes (1889-1900) at Nippur, under the auspices of the University of Pennsylvania, have also furnished some of the material, as have the French excavations at Susa under De Morgan and the excavations of the German Orient Society at Babylon and elsewhere. Of the two terms, Sumerian and Akkadian, the former is derived from the designation of Sumer, for the northern section of the Euphrates valley, while the latter is derived from Akkad, the designation of the southern section; and since Sumer is spoken of as "the land" *par excellence*, it may reasonably be concluded that the northern section is the home of the inventors of the cuneiform script. Sumer and Akkad did not at all times form a political unit. For a long time the Euphrates valley was divided up into a number of little principalities, each with a capital and its own tutelary deity. In the south, the chief centres were Eridu, Ur, Larsa, Uruk, and Nippur; in the north, Sippar, Cuthah, and Kish. Of these early principalities we can at present follow the history of one only, namely, Lagash (or Shirpurla)—on the site of the mound Tello. We have the names of no less than twenty-two of its rulers, beginning with Lugal-shag-engur and ending with Arad-Nannar, covering roughly the period of circa 3000 to 2,600 B. C. Under Sargon practically all of Sumer and Akkad had to yield to the Semitic invasion. The steady advance of the Semites naturally provoked as the most striking historical feature a prolonged conflict between the two races. After various ebbs and flows of fortune, the Semites finally succeeded, under Hammurabi (circa 1900 B. C.), in making themselves masters of the Euphrates valley. Henceforth till the downfall of Babylon in 538 B. C., through Cyrus, we have a strong centralized empire, with Babylon as its capital. For centuries previous to Hammurabi, the process of the assimilation of the older Sumerian culture by the Semites had been going on. The Semites, however, put their peculiar stamp upon this civilization, so that outside of the language the Sumerian elements in the Euphratean civilization were to all practical purposes effaced.

From this rapid survey it will be seen what a wealth of historical material is embodied in the pages of Thureau-Dangin's work. The texts are given in chronological groups (so far as this has been fixed), beginning with the rulers of Lagash and ending with those of Uruk. On one page is the transliteration of the texts and on the adjacent one the translation, with copious foot-notes to justify the renderings given and to discuss obscure signs and combinations. The study of the Sumerian texts (as with few exceptions all in this volume are) has now advanced sufficiently to enable scholars to interpret short texts with absolute certainty in all but minor points. When it comes, however, to long texts in Sumerian, such as those on two large cylinders of Gudea and on some of the statues of this king, there are many passages which remain obscure and will remain so until through additional material we obtain a clearer insight into the syntax of Sumerian—for it is here that the chief difficulties lie. Thureau-Dangin is obliged to confess his inability to give a satisfactory meaning to hundreds of passages, but his self-restraint in resisting the attempt to guess where certain knowledge for the present comes to an end, leads us to have all the greater confidence in the renderings proposed by him for an equally large number of passages that had hitherto baffled scholars. The immediate result of Thureau-Dangin's admirable volume will be to stimulate Sumerian researches among the two or three dozen Assyriologists in this country and Europe. To be sure, the field of Assyriology is now so large that it is impossible for one specialist to cover the entire domain, but all Assyriologists are brought into contact at some point in their studies with Sumerian.

It is difficult for the outsider to form an adequate idea of the learning and patient labor involved in such an undertaking as Thureau-Dangin has carried to a successful issue. It definitely establishes his position as the leading Sumerian scholar of the day; and his volume may be said to mark an epoch in the development of Sumerian studies. Thureau-Dangin is still a young man, and much is to be expected from him in the years to come. It is only proper to record and emphasize here the indebtedness of all students of ancient culture to him.

The Odes and Epodes of Horace. Translated into English Verse corresponding with the Original Metres by John Marshall. [The Temple Greek and Latin Classics.] New York: G. P. Putnam's Sons. $1 net.

To the present translator of Horace one might begin by quoting his own version of the *Illi robur:*

> Him, heart of oak and brass thrice-knit
> The breast encased, who 'gainst the cruel deep
> His fragile bark first dared to pit,—

which is good counsel in doubtful grammar. So many venturers, from retired prime ministers to Grub Street hacks, have gone down in that sea, that we watch each newcomer with trepidation. The fact is simply that Horace—more perhaps than other poets—cannot be translated. His virtue lies in his language, in the inimitable felicity which gives to commonplace sentiment the beauty of something rare and final. Into what English will you change *Spes animi credula mutui*? "Nor credulous dream of heart's exchange," is well enough, but it could never have run in the minds of men for two thousand years. Or, into what English will you transmit that *Nox erat et cœlo fulgebat luna serena,* which Schopenhauer used as a text for his discussion of the imagination? The absolute propriety of language was never better exemplified than in scores of these phrases and verses.

So much must be said. We may add that Dr. Marshall, who is rector of the Royal High School, Edinburgh, has made this translation the business of forty years' study, and that in many of the poems he has come nearer to the impossible than any other translator with whom we are familiar. In one thing he has been particularly fortunate—in suggesting the rhythm of the original stanzas, while using forms thoroughly English. As an illustration of his cunning treatment of the Alcaic, the following may be selected:

> Spare and infrequent pietist was I
> While, skilled in the philosophy of fools,
> I strayed. Now back from all the schools
> Reversed my course I try
> Towards whence I came.

To show with what feeling for rhythm he distinguishes between metres nearly akin this Alcaic may be compared with the Asclepiadean ode on which Milton laid so heavy a hand:

> What slender youth, with wealth of roses sheen
> And with sweet essences besprent, pursues thee,
> In cool grot, Pyrrha, woos thee?
> For whom thy yellow hair dost preen,
>
> Simple, yet exquisite? How oft, ah me!
> Vows broken he'll deplore and gods that change;
> And, to thy whimsies strange,
> Shall gaze where glooms a wind-swept sea;
>
> Who credulous now dotes on thy tinsel gold,
> And dreams thee ever willing, ever kind,
> To thy fair falseness blind!
> O hapless, who untried behold
>
> Thy glitter! Lo, my dripping weeds I place,
> With picture vowed, on Neptune's temple wall,
> My saving to recall
> From shipwreck by thy siren face.

That is Dr. Marshall at his best, and it is good work. He is, as a rule, less successful in the graver poems than in the *nugæ canoræ*, but he is seldom quite flat, and his version as a whole may be heartily recommended to those who are shut out from the original. We hope that Dr. Marshall will add the Satires and Epistles in a separate volume.

The book, like all the volumes of the series, gives the original and the translation on opposite pages. In this case the type is comfortably large and clear, which cannot be said of one or two of the earlier issues.

In the Footprints of Dante: A Treasury of Verse and Prose from the Works of Dante. Compiled by Paget Toynbee. Pp. xi., 398. London: Methuen & Co. 4s. 6d.

Mr. Toynbee's latest book is a natural result of the work he did, not long ago, in cataloguing more than two hundred and sixty English and American translators of Dante, from about 1380 (Chaucer) to 1906 A. D. It is a bilingual chrestomathy of many famous or beautiful passages, mostly brief, and chosen not only from the "Vita Nuova" and the "Divina Commedia," but from Dante's Latin works. Every translation is accompanied by the Italian or Latin text, and over each fragment the compiler has set some indicative title, such as "Envy," "Flakes of fire falling like snow," "A baffled falcon," "Florence in the olden time," "Love as a pilgrim," "To Guido Cavalcanti" (in Shelley's lovely translation). There follow various great passages from the "Convivio," "De Monarchia," and the Epistolæ, admirably translated by the compiler himself.

To search every English translation of Dante for the "best" rendering of those passages which have won the widest admiration would be a prodigious task, and would probably result in convincing whoever undertook it that at least nine-tenths of Dante's translators must now be atoning in Giudecca. Fortunately, a few glances are usually enough, and one returns with an easy conscience to well-known names, leaving the rest to their dust and silence. Mr. Toynbee has apparently not undertaken a universal exploration, but has looked for his gems in a dozen of the likeliest places. His earliest translator is justly Chaucer; others are Cary, Byron, Shelley, Wright, Hayley, Shadwell, Tennyson; he might have found fine bits in Charles Eliot Norton's "Vita Nuova," and in T. W. Parsons, but neither is included. All the prose passages are translated, and excellently translated, by Mr. Toynbee himself. Perhaps because they were too long, some of the most beautiful scenes in the "Commedia" are absent: Francesca da Rimini, Pier delle Vigne, Ugolino; in general, the compiler has omitted almost every scene wherein Dante has shown his power to depict the basest passions, violence, and horror. Here Dante is presented in his gentlest moods, whether in poetry or philosophy.

To one important fact, at least, this book is another convincing witness: the English language is capable of expressing adequately what Dante wrote, but in five centuries and more no one translator has done twenty consecutive verses so well as to justify any one in saying, This is not Dante, for English is not Italian, but it is true to his thought and beautiful in itself. A Byron, a Shelley, or a John Payne, might indeed have made Dante as great in English as he is in German; but that was not to be.

My Memoirs. By Alexandre Dumas; translated by E. M. Waller. Vols I. and II. New York: The Macmillan Co. $1.75 each.

The first two volumes of the translation by E. M. Waller of Alexandre Dumas's "Memoirs" bring the hero and the reader to 1825. A thousand pages devoted to the career of a youth before his twenty-third summer might seem an undue allotment, even taking into account Dumas's tumid imagination, were not the histories of all the incidental characters expounded with the minuteness of the old episodic romances. Through many chapters the chief person is the novelist's mulatto father, Gen. Alexandre Dumas, soldier of the Republic, son of the aristocrat, Davy de la Pailleterie, and the West Indian negress, Marie-Cessette Dumas. The author takes as much time in reaching his own birth as Sterne did in getting to that of Tristram Shandy, Esq. Dumas treats his father in superlatives, and makes him perform feats to daunt even Porthos or d'Artagnan. He gives him a giant's strength and one is reminded of nothing so much as the career of Rabelais's Gargantua and Friar John in reading how that officer helped his regiment to escalade a fortification by taking each man by the seat of his trousers and the collar of his coat and throwing him over the palisades; or how he could clutch a beam with both hands and lift from the ground by his legs the horse on which he was mounted. Gen. Dumas was, however, no match in appetite for a certain Boudoux of whom we are told:

> They put the whole calf in the oven, and when it was cooked, Boudoux ate it all.
>
> When he had picked the last bone, my father complimented him on his performance.
>
> "I hope your hunger is satisfied now, Boudoux?" he said.
>
> "Put the mother on the spit, general," replied Boudoux, "and you will see."
>
> My father drew back, for he was fond of his cow, and Boudoux was likely to leave nothing of her but the horns.

Many pages are devoted to the heroic, but unappreciated, deeds of Gen. Dumas, the "Horatius Cocles of the Tyrol," in the service of Napoleon, who was clearly less impressed by them than were the general and his son. Then, after much information on the writer's own youth and interests, ranging from trapping larks to a chapter on Charlemagne's clothes, we at last reach Dumas's first contact with literature through the drama, and are promised "the development of art in France during one-half of the nineteenth century." The fulfilment of this promise is initiated at the rate of three chapters devoted to one performance of Nodier's "Vampire," at which Dumas was present. No wonder that the "Memoirs" were never finished.

Obviously, these chronicles are not to be taken as history. A writer of such careering imagination could not be confined to mere facts. But it is an amusing pastime to put one's self in his frame of mind and read the "Memoirs" as a Dumas romance. The characters, though they bear historical names, are doubtlessly as untrue to life as the persons in the Valois stories, the adventures of the three musketeers, or those in the Cagliostro group. Nevertheless, it was J. J. Weiss who said of Dumas that he had *le don de mentir dans le sens de la vérité.*

The first volume is preceded by an interesting essay by the lover of Dumas, Andrew Lang.

Science.

The Prolongation of Life. By Élie Metchnikoff. New York: G. P. Putnam's Sons. $2.50 net.

In this entertaining volume of 340 pages, Professor Metchnikoff of the Pasteur Institute in Paris, writes as one imbued with a deep sense of the overpowering strength of those unknown physical forces which condemn mankind to the ravages of disease, old age, and death; he writes, too, with the spirit of a seeker after truth. His book, while highly suggestive, is intended to be neither exhaustive nor conclusive. Its purpose is rather to point out the problems of somatic limitations, and the principles involved in attempting their ultimate solution.

As to disease, the first member of the destructive triad, scientific inquiry has long ago revealed the fact that many maladies are preventable through a proper understanding of causation and communicability, especially where the causative agent is some microscopic organism. It is therefore to the student of zoölogy and bacteriology that we must look for knowledge of the origin, growth, and destruction of disease-producing germs. Reasoning thus, Professor Metchnikoff has come to the belief that old age and death are probably due to infectious organisms which have taken up a permanent abode in the digestive tract, but which, through various activities, affect the entire system. If this view be sound, then mankind is theoretically in sight of perennial youth, and an eternity of earthly existence. Metchnikoff, of course, makes no such extravagant claim, but he believes that if we were in command of absolute knowledge regarding the causes of old age and death, human life could be greatly prolonged. This is certainly a wholly sane opinion.

Professor Metchnikoff blames the large intestine for human decay and death, because he thinks it useless and merely a culture tube for hosts of dangerous bacteria. He goes on to say that since lactic acid, produced when milk sours, is capable of diminishing the activity of intestinal bacteria, therefore the logical prevention of old age is the proper use of lactic acid as an intestinal medicament. But with all due respect to the author's professional attainments, he does not seem to make enough of other modes of body invasion by specific organisms. Moreover, he fails to emphasize the fact that disease is not an entity in itself, but that it is really the product of two factors: vis., bacteria and their toxins, and diminished resistance of the human body to these enemies. If we could defend ourselves absolutely against bacteria by killing them off or by manufacturing some anti-body to render them inert, then diseases which are a product of bacterial activity would cease to exist, and old age, in so far as it is a result of such disease, would cease to exist also. To quote a high authority, Prof. C. A. Herter, in his "Bacterial Infections of the Digestive Tract," reviewing Metchnikoff's thesis, notes that the latter has singled out no definite group of bacteria, but accuses all of them equally. Moreover, Metchnikoff does not point out the differing reactions of different individuals to the presence of the hostile organism, and the varying degrees of pathogenicity inherent in varying races of bacteria. These, however, are mere technical differences; and Herter believes with Metchnikoff that "there is certainly much to recommend the view that putrefactive intestinal processes are favorably influenced by fermented milk containing an abundance of lactic acid, and lactic acid organisms." But "whether the lactic acid bacilli in a thoroughly fermented milk will go on producing lactic acid in the digestive tract is uncertain, and probably depends on the presence of fermentable carbohydrates." As a matter of clinical knowledge, lactic acid in considerable quantities is present in cancer of the stomach, and yet it exercises but little effect on the processes of fermentation and putrefaction in the intestines.

The book contains, among other matters, chapters on "Morality and Human Nature" and "Pessimism, Health, and Age." The author tells us:

> Young people, who are inclined to pessimism, ought to be informed that their condition of mind is only temporary, and that according to the laws of human nature it will later on be replaced by optimism.

In the final chapter, Professor Metchnikoff declares that one's ideal should not be that of Herbert Spencer, a simple prolongation of life, but a development that may pass through a "long period of old age in active and vigorous health leading to the final period in which there shall be present a sense of satiety of life, and a wish for death."

A third and final volume of the "Metabolism and Practical Medicine," of Carl von Noorden (Chicago: W. T. Keener & Co.), has appeared at a short interval after the completion of the second volume of the German original. Both volumes contain a discussion of the metabolic processes in a large number of diseased conditions, and also in relation to therapeutic measures. These questions are considered monographically by fourteen writers, the whole work forming a greatly extended revision of Von Noorden's single volume of 1893. There are marked differences of opinion among medical men as to the utility of this line of study, but all will be glad to have the enormous material in a fairly convenient and accessible form; and many of the discussions will be found to be inspiring quite apart from the validity of some of the conclusions. Most of the matter has a strictly professional interest, but the non-medical reader will find abundant profit in the part by A. Magnus-Levy on the "Physiology of Metabolism" (being the first volume of the translation) and possibly in the chapters on mineral waters and baths. The English version in three volumes, the first two having appeared last summer, is made by twenty-one different translators, who, with few exceptions, are British teachers of medicine. Prof. L. Walker Hall of University College, Bristol, is the general editor. The translation is fresh and often rather free. but appears to be adequate as judged by a dozen comparisons quite at random. Some effort has been made to revise the later chapters, and to extend the bibliography. An appendix, especially prepared for the English edition, and containing a tabulation of food values, is marred by frequent slips of the pen or types, such that the proper correction is not always obvious.

Prof. P. Stroobant of the Brussels Observatory has just published statistics of the existing astronomical observatories, and states that there are in the world 479 such establishments, public and private. In Europe alone there are 305, distributed as follows: Great Britain and Ireland, 97; Germany, 51; France, 39; Austro-Hungary, 28; Italy, 21; Russia, 19; Holland, 10; Spain, 8; Switzerland, 8; Belgium, 6; Portugal, 4; Sweden, 4; Denmark, 4; Norway, 3; Greece, 2; Bulgaria, Servia, and Rumania, each 1. In America there are 145, the United States reporting 105. Asia has 18 and Africa 11.

The University of Cambridge (England) now offers a diploma in anthropology. It will be given for research work only, instead of by examination as at Oxford.

The death, in his eighty-first year, is announced of Lieut.-Col. R. L. J. Ellery, late director of the Melbourne Observatory. He was the first government astronomer in Victoria, and also director of the geodetic survey of the colony, 1856-74. In 1873 he organized the Victorian Torpedo Corps. Amidst his other occupations, he found time for writing several volumes on astronomical and meteorological subjects. Since 1895 he had retired from active employment.

Drama.

La Nave. Per Gabriele D'Annunzio. Milan: Treves.

On January 11, after weeks of preliminary chatter, "The Ship" ("La Nave") was played at Rome. The seats were bought at staggering prices. A noble and distinguished audience received the tragedy with enthusiasm, readily cheering down the few hisses that arose during the more scabrous scenes. The King invited the author to the royal box, inquired eagerly as to the sources of the piece, and thanked Signor D'Annunzio for his glorification of the Roman tradition of sea power. Your reviewer congratulates himself on his remoteness from all this adventitious glamour. With the handsome quarto of the publisher Treves on one's desk, the materials for a literary judgment of the tragedy are complete, and since it is unlikely that "The Ship" will ever be played in America, that is all that your readers will reasonably require.

After a thrilling invocation of Sea Power—a most interesting Italian companion piece for Kipling's "The Seven Seas"—which ends:

> Make of all oceans our [Italian] sea
> (Fa di tutti gli Oceàni il Mare Nostro)

the curtain rises upon the prologue. It is Venice of the year 552, a busy place trying to raise itself above the mud of the lagoon. There is a population watchful of the waters, whence comes news of the conquering Byzantines in the neighboring fens, and of new sandbars thrust across the path of the ships. It is also a moment of political expectancy. Venice stands in doubt whether to attach herself to Byzantium or to do for herself. The pitiful, eyeless figures of the ex-Tribune Orso Faledro, and his three sons, extortioners and partisans of Justinian, show that for a moment the issue has been decided in favor of independence. It is doubly a moment of expectancy; for word is due of the success or failure of the expedition which Marco Gràtico, head of the Venetian party, has led to the mainland to recover the relics of the tutelar saint of the once Aquileian colony. While waiting, men discuss the hard fate of Faledro, and, naturally, the rumor that his daughter Basiliola has become a great courtesan in the Byzantine camp. Soon she herself appears from the sea in a beauty and splendor of attire that make the water folk hail her as a siren, while her fascination visibly moves them all. She lands to meet the shattering sight of her mutilated father and brothers. The affecting scene is interrupted by the arrival of Marco Gràtico bearing the relics. He is hailed by the refugees as their Tribune; and at the same time his brother, Sergio Gràtico, is named as Bishop. The scene throughout is full of voices from unseen choristers. These represent the Latin Church asserting itself, and one, a kind of embodiment of Venice herself, bids the city establish itself on the new ship Tuttilmondo, which is building by the Rialto.

The first episode shows Basiliola in moral and corporeal possession of the new Tribune. For her he has cast her maligners and her father's torturers into the filthy trench, Fossa Fuia, and she has come to mark their agony as they bawl for bread. As they see her in her harlot's splendor, by turns they rave lustfully for her—the usual attitude of crowds towards Basiliola—or insult her grievously in the hope that she will end their torture. At last, stung by an intolerable affront, she grasps a bow from a guard, and slays the chief spokesman of the prisoners. Then, intoxicated by the sight of blood, she shoots slowly and voluptuously prisoner by prisoner until the trench—naturally not seen on the stage—is full of dying groans in which desire and hatred mingle inextricably. Upon this scene comes the zealot Traba to rebuke the murderess. Her answer is to disrobe herself in part, and when his bitter words ignore this allurement, she moves to slay him too, but is stopped by her lover, Marco Gràtico. There follows a remarkable contest in which the Tribune's horror and distrust yield to her blandishments, and as he kneels to recover her fallen tunic she fires his imagination with visions of winning through her aid the imperial crown of Byzantium.

For Byzantium, as the second episode shows, Basiliola has also claimed the Bishop Sergio. We see him in the new basilica engaged in an orgy. In memory of the Last Supper effeminate priests mutter awful heresies, while Basiliola maddens them all as she dances lasciviously with her seven slaves, the guardians of the seven candlesticks. From without is heard occasionally the austere psalmody of the Latin zealots, who at last led by the presbyter Teodoro, burst in upon the godless revel and begin to drive the feasters from the temple. An extraordinary choral debate ensues between the factions, with Basiliola in defiant possession of the altar. At last the matter is referred to judicial combat between the brothers, the Bishop and the Tribune; and Marco wins in the fratricidal duel.

The third episode is practically an epilogue. The great ship Tuttilmondo is ready for launching. Upon it Marco Gràtico will take the sea in expiation of the slaying of his brother. He will clear the sea of pirates and will cut his way to Alexandria in the hope of recovering the body of St. Mark. Behind the ship flares the fire upon the altar the sailors maintain to a pagan Victory. Latin Christianity is reëstablished; all is finished except the punishment of Basiliola. In prophetic words she announces the naval destiny of the city and offers herself as helpmate on the ship. As Marco Gràtico promises to nail the temptress to the prow in the guise of a figurehead, she casts herself upon the fire of the heathen altar, as an offering to the goddess of naval victory, and the ship is launched amidst the benedictions of the throng and choristers.

So ends what the author call "An Adriatic Tragedy."

It is the first time that D'Annunzio has essayed a public theme, though the supreme value of the Latin spirit is celebrated in many of his works. Into his new matter he has carried over the spectacular, or panoramic, methods, that were both the strength and the weakness of "Paolo and Francesca." In a subject that fairly challenges comparison with "Julius Cæsar" and "Antony and Cleopatra," he reveals rather little dramatic resourcefulness. The real conflict lies not between the main characters, but between the Latin and Byzantine factions speaking through the choruses; and real suspense there is none, for the victory of Rome is foregone. Only Basiliola has real existence. On the other hand, her baleful power to enthrall is asserted by highly arbitrary devices. The lust which crowds always feel for her seems based on a false psychology. It is doubtful if stern preoccupation with public affairs, which is always present, admits of such ready conversion into private concupiscence. Still Basiliola is an extraordinary, and eminently characteristic creation. She is more than an avenger, more than a seductress, more than a tool of Byzantium. She is Byzantium, conceived solely in the light of its monstrous depravity and soulless might. The play could have been called "Byzantium Repulsed." It is a defect of the tragedy that nobody embodies with equal clearness the Roman spirit. Surely not the Deaconess Ema, the champion of the Latin Church in Venice, who barely appears; surely not her son Marco Gràtico, a waverer who follows the last temptation or the last command. The ideas that are comprised in a Cæsar, Antony, Brutus, Cassius, are singularly vague in this tragedy, and one will hardly accept the battling hemistichs and strophes of the choruses as a substitute for real drama.

As represented on the stage, the shooting of the prisoners is said to be both disgusting and tedious, and the self-immolation of Basiliola ineffective. We can readily believe it. Even D'Annunzio's diseased imagination has never asserted itself more revoltingly than in the first episode, and one should recall that this pleasing confection of blood and lust is after all *hors d'œuvre* serving merely to underline what is elsewhere perceived in Basiliola. A gratuitous experiment in obscenity, none the less real because scenically veiled, a sacrifice of a character to the symbolism of Byzantium, whatever the reason, the scene of the Fossa Fuia should never have been written. Again the orgy is chiefly an exhibition of Basiliola, serving no dramatic end. At the close of an act almost as revolting for lust as its predecessor for blood, the heretical bishop is slain in a quite casual duel.

Unless we are to give full credit to a symbolism imperfectly realized, unless we yield our enthusiasm unreservedly to what may be regarded as a great naval tract, we shall feel that D'Annunzio's "The Ship" merely reveals once more his highly tropical talent in a familiar phase. If Byzantism is as he depicts it a blend of lechery, bloodthirstiness, and unintellectualized power, Byzantine is the epithet that suits much of D'Annunzio's only literary achievement. The play is gorgeous as description and notable as poetry. Like "Paolo and Francesca," it gives most vivid pictures of a civilization. It is perhaps worth noticing that the voluminous stage directions are, as usual, quite as elaborately wrought as the verse itself. He claims for the drama all the discussive advantages of the romance. And this suggests that the capacity for dramatic inference is possibly as feeble in the author as he believes it to be in his readers.

As a literary drama the work has remarkable merit. The poetry conceals many of the weaknesses of construction. A mist of passion seems to enwrap the action. For such illusion the poet must have praise. At bottom the piece shares many of the qualities and defects of Flaubert's "Salammbô." An awful theme is coldly imagined, the fancy is deliberately flogged to the verge of insane hallucination, and a magnificent rhetoric offers itself as a substitute for the more spontaneous and durable traits of genuine invention.

Of the "Shakespeare's England" section of The Shakespeare Library (Duffield & Co.), under the general editorship of I. Gollancz, we have before us three volumes containing "Robert Laneham's Letter," edited by F. J. Furnivall; "The Rogues and Vagabonds of Shakespeare's Youth" (Awdeley's "Fraternitye of Vacabondes" and Harman's "Caveat"), edited by Edward Viles and F. J. Furnivall; and "Shakespeare's Holinshed," by W. G. Boswell-Stone. All three of these books have done good service in Shakespearean study, but it seems hardly fair to the public that neither the prospectus nor the volumes themselves, except the first, should contain any intimation that we have here merely unchanged reprints of works that were published many years ago—the earliest of them nearly forty years ago. A couple of pages of random notes by R. B. McKerrow have been prefixed to "Robert Laneham's Letter," but otherwise the volumes appear in their original forms without addition or alteration, either in text or editorial comment. The works in question are, of course, rendered more accessible now through these reprints; it is a pity, however, that no attempt has been made to bring the new editions up to date.

Edward Vroom, the American actor and playwright, who was for several seasons a member of the Booth-Barrett and Booth-Modjeska organizations, and who later toured the country in his own versions of "Don Cæsar de Bazan," Victor Hugo's "Ruy Blas," and other plays, will soon return to the New York stage. This will be Mr. Vroom's first appearance here as an actor since his admirable production of François Coppée's "For the Crown" at Wallack's Theatre, ten years ago. Since that time he has been in England, where he has won success as an author and as leading actor in Drury Lane Theatre, London, and in the provinces. Mr. Vroom is a romantic actor of notable skill, grace, and power, as well as a thoroughly capable stage manager.

The new comedy which Henry James has written for Forbes Robertson will be produced in Edinburgh in March.

Music.

Music Club Programs from All Nations. By Arthur Elson. Boston: Oliver Ditson Co. $1.25.

The Opera. By R. A. Streatfeild. Philadelphia: J. B. Lippincott Co. $1.25 net.

Mr. Elson's latest book subserves a practical purpose, being described on the title-page as "an historic outline of each national school of music, with questions for study, and a series of programs for the use of clubs and other organizations." Such a book, undoubtedly, has been a desideratum. This country contains a large number of women's clubs which arrange concerts every winter. A favorite plan is to have evenings devoted to one composer or a particular school of music. Mr. Elson has evidently noted this disposition, and his book gives just what those who plan and carry out such entertainments need. The first chapter, for instance, devoted to Classical Germany, gives brief sketches of Handel, Bach, Gluck, Haydn, Mozart, Beethoven, and Schubert. These are followed by specimen programmes for each composer, samples being offered of three grades: easy, medium, and difficult. Then come similar chapters on Romantic and Modern Germany, France, Italy, England, The Netherlands, Norway, Sweden and Finland, Denmark and Switzerland, Bohemia, Hungary and Poland, Russia, America. Excellent judgment is shown in the choice of pieces. Mr. Elson's book might also be used as a brief sketch of the history of concert music, beginning with the eighteenth century, which, with the nineteenth, produced nearly everything that has survived in concert halls. Mr. Elson would perform a useful service if he issued as a sequel a volume devoted to the history of concerts, doing for Europe and America what Hanslick did for Vienna in his "Geschichte des Concertwesens in Wien."

While Mr. Elson confines himself to concert music, Mr. Streatfeild's book is entitled "a sketch of the development of opera, with full descriptions of all works in the modern repertory." The first edition of this serviceable work appeared in 1897; the present, the third, is carefully revised, and enlarged from 336 to 359 pages. In the first edition the reader will look in vain for accounts of some operas now much in vogue, such as Puccini's "Tosca" and "Madama Butterfly," Charpentier's "Louise," Strauss's "Salome," Debussy's "Pelléas et Mélisande"; these and other novelties are now fully described. The author, unfortunately, omitted a résumé of the interpolations, thus missing a chance for an interesting glimpse of the operatic history of a decade. D'Albert's successful "Tiefland" escaped his vision.

Mr. Streatfeild's volume is prefaced by a long and interesting introduction from the pen of Fuller Maitland, who pays the author the deserved compliment of saying that he has written the book "with a rare and delightful absence of prejudice." This is exemplified in the remarks on "Pelléas et Mélisande." While granting that Debussy has wilfully abjured melody of any accepted kind and harmony conforming to any established tradition, Mr. Streatfeild maintains that the effect of the music is "singularly striking and persuasive," and that the composer "deserves the credit of striking a note entirely new to the history of music." The most laudable thing about this volume, however, is the combination of clearness and conciseness in the telling of operatic plots—not an easy feat to perform in view of the extraordinary obscurity of many of these stories, especially in the older Italian operas. Even "Il Trovatore" has no terrors for Mr. Streatfeild.

Partly because of the lack of competent opera singers, it has become customary in many of our cities at the spring music festivals to give such operas as "Carmen," "Faust," and Lohengrin" in concert form, without scenery, costumes, and action. Both Seidl and Damrosch produced Wagner's "Parsifal" in concert form before Conried had the temerity to horrify Bayreuth by staging it. London is soon to hear Strauss's "Salome" in a concert hall, because as an opera it is not permitted. Somewhat different is the case of Tchaikovsky's "Eugene Onegin," which Walter Damrosch has just produced at Carnegie Hall. As an opera it has failed everywhere, except in Russia, where it is very popular; yet there is much beautiful music in it, which the audience was glad to hear in the concert hall, since our opera houses have persistently ignored it. It was well sung and played, too; yet one could not but feel that it would have been wiser for Mr. Damrosch to select only the best numbers, and not to try to follow the plot. There are many other operas, some of them favorites of our fathers, but now obsolete, which contain several numbers each that might be revived to the delight of concert-goers.

The New York Symphony Society will produce a new work by an American composer at the twelfth Sunday afternoon concert, February 9, at Carnegie Hall. This composition is Ernest Schelling's "Fantastic Suite" for piano and orchestra, which he composed in 1905-1906. Mr. Schelling will perform the piano part of his suite.

Art.

THE ARCHITECTURAL LEAGUE.

The twenty-third exhibition of the Architectural League of New York is well worth seeing, as a record of what is being done in architecture, decorative painting, sculpture, and landscape work. With the painter or the sculptor, the presentation of his subject is a comparatively simple matter, for what he shows is virtually, if not actually, his finished product; but for the architect, as for the landscapist, the exhibit must necessarily be conventionalized to be brought indoors. Now, since the public understands the architect better when his design is shown in color, with the accessories of topography, vegetation, and animal life, which add interest and are an index of scale, and since it is chiefly for the lay public that these exhibitions are held, each successive year shows a greater variety and skill in method of expression. The drawings are no longer rendered in simple black and white, with here and there a touch of color, but many are specially prepared by skilled artists. Interspersed are numerous photographs of completed buildings or of interesting details, supplemented by models in plaster, and panels in stone.

In one respect the Exhibition Committee has displayed questionable judgment. At the northerly end of the entrance corridor are the three largest rooms, the two further rooms communicating by short flights of steps. In the centre of the middle room is a fountain around which the Committee has placed eight Ionic columns, coupled in pairs by an interrupted architrave. If the pergola were a novelty, or if this one were of remarkable beauty, the congestion of the thoroughfare of the smallest room might be justifiable; but, aside from these objections, the columns interfere with the complete view of the principal exhibit of the Vanderbilt gallery. This is a canvas, 8 by 14 feet. The Attributes of the Arts, by Albert Herter—an artist of unquestioned ability. Pegasus stands on the left with Genius and Experience; in the centre kneels Inspiration, a youth holding aloft a torch; on the right are Truth, Beauty, Strength, and Abundance; the background is an Italian landscape of cliff and castle, sea and sky, the entire conception classic. But the charm of color—a perfect riot of color—the elaboration of the figured draperies, the poetic imagery, are seriously impaired by the suggestion of semi-conscious nakedness of the undraped figures, a suggestion emphasized by the beautiful clothing of the others.

In the surroundings of this canvas the committee has shown much consideration; for framed in by garlands, it is capped with a sculptured pediment of some importance by Karl Bitter, and all other color has been relegated to the east, south, and west walls of that gallery. The corners are punctuated with sculpture in low relief; the memorial tablet of Dr. Thurston, for Cornell University, by H. A. McNeil, being worthy of more than passing notice. Near the opposite corner is a group of photographs in brown, and among them one of a picturesque and delightful half-timbered country house at Locust Valley, by Grosvenor Atterbury, and another at Ridgefield, Conn. Each design—especially the former—suggests a homely hospitality and a fitness to the surroundings that should delight both owner and architect.

At the opposite end of this gallery are several large drawings of those enigmas of American architecture—skyscrapers. But however ingenious, forcible, or impressive many of them may be; however picturesque, when seen from bridge or ferry, in their grouping or their isolation, at sunset with their myriad of twinkling lights; however successful as money-getters some of them undoubtedly are, we may yet ask how many individual skyscrapers there are in New York, or anywhere in America, which give genuine or permanent pleasure. Test any of them by the grateful memories of Pisa, Venice, or some of the hill towns of Italy, or the Gothic towns of France, and with little regret we can forget the skyscraper. One of the designs shows "the highest building in the world." The drawing does not, however, convey the impression that this claim should be taken seriously; for, not accidentally, but purposely, the upper end of this huge shaft has been enlarged (not diminished) by convex curves in almost every conceivable direction. The rendering of some of these drawings by Birch Burdett Long and Carlton T. Chapman is so admirable, however, that the exhibition does not suffer so keenly as does the city of New York. Of recent years the New York Chapter of Architects has voted a medal to be awarded annually for the best building erected within the previous five years; and this year the Maryland Institute, at Baltimore, designed by Pell & Corbett, received that honor. This is a building suggestive of the Florentine palaces of the Strozzi, Riccardi, Rucellai. It is barely three stories in height (for the upper one is only an attic), dignified in its simplicity. This award would indicate that both designer and critic are agreed that the architect has not yet solved the problem of the skyscraper except from the constructive or commercial point of view, and that the artist has little genuine sympathy with megalomania.

Among the more gratifying and encouraging exhibits may be mentioned the classic design of Carrère & Hastings for the Borden tomb in Woodlawn Cemetery; the interesting historical memorial indicated as the "Improvements on the Lincoln Farm, Hodgensville, Ky.," by John Russell Pope; and the Orphan Asylum at Wallingford, Pa., by Delano & Aldrich. The last mentioned does not advertise its cost, but rather the excellent sense of proportion of some English work of the seventeenth and eighteenth centuries.

In the class of monumental and civic work there are Mr. Post's design for the Wisconsin State Capitol, which shows an ingenious and clever plan, with entrances not only in each façade of a Greek cross, but within the reëntrant angles, the whole edifice crowned with an unusually successful dome; a public bath for the city of New York, big in scale and simple in design; the Brooklyn Municipal building, also a fire house and amusement hall, by Lord & Hewlett; and a group of police stations, by S. B. Colt, Hunt & Hunt, and others.

Of the designs for, and photographs of, churches and ecclesiastical edifices, the most serious are those presented by Cram, Goodhue & Ferguson; and the most important are their designs for St. Thomas's Church, which promise a notable example of modern Gothic work. In these studies inspiration has been drawn from both English and French sources; and notwithstanding the heaviness of the lowest section of the buttresses (which seem to resist a non-existent excess of thrust), the crowding of the façade by the largeness of the tower and the bigness of the main portal, the erection of such a churchly building will be a great gain to American ecclesiastical architecture.

This exhibition is exceptional in the number of examples of good draughtsmanship. The crayon studies for a decoration in the College of the City of New York, by Blashfield, are worthy of many visits; for there is probably no living American artist whose productions are marked by greater refinement, conscientiousness, and sincere sympathy with his work. The pencil sketches of Vernon Howe Bailey amply justify detailed examination. Among the studies for decorations are two photographs of figure groups by La Farge, though not the best work of that great colorist; and another of a small portion of Siddons Mowbray's successful decoration of the library of the University Club.

Of plastic art there are many examples: statues, busts, reliefs, fountains, grotesques, vases, are everywhere. Of these the two groups, Jurisprudence and Commerce, by French, are decidedly the most interesting. Though perhaps they are inferior in design to his Four Quarters of the World in front of the New York Custom House, they have great charm. In the single statues for the Brooklyn Institute of Arts and Sciences, modelled by Herbert Adams, Kenyon Cox, John Gelert, Charles Keck, and others, with the general coöperation and direction of French, far greater harmony and dignity has been attained than with similar sculpture in the Appellate Court or the Custom House. Two statues by Augustus Lukeman, for the Royal Bank at Montreal, and the modelled relief of the socle of the Thomas Memorial for Nashville, Tenn., by Enid Yandell, possess considerable merit.

In the annual competitions inaugurated by the league, the gold medal was not awarded this year, but the silver medal for architecture was given to Herman Kahle, a student at Columbia University; the President's prize, a bronze medal for mural painting, went to Hugo Ballin of New York City, with special mention to Anna T Lang—*hors concours* because of her residence out of this city and non-membership in the league; the Henry O. Avery prize of $50 to Charles Cary Ramsey of New York city. A special prize of $300 was awarded for the first time to Evelyn B. Longman, sculptor, Milton H. Bancroft, painter, and Henry Bacon, architect, for work in collaboration; the trio of Gertrude V. Whitney, sculptor, Hugo Ballin, painter, and Grovenor Atterbury, architect, were placed *hors concours*, for one of them is on the Committee of Award.

WILLIAM MARTIN AIKEN.

There is no department of "Art in America" in the January *Burlington Magazine*, for the reason, apparently, that the matter that should have gone into that department has nearly filled the main part of the number. This is an illustrated account of pictures and art treasures acquired by Mrs. C. P. Huntington and Archer M. Huntington from the Kahn Collection. The five pictures acquired by Mrs. Huntington are all Flemish or Dutch: a Virgin and Child ascribed to Roger de la Pasture; a Scholar with a Bust of Homer, and a Hendrickje Stoffils by Rembrandt; and two portraits by Hals. Mr. Huntington's acquisitions are all Spanish; the Velasquez Portrait of a Little Girl, illustrated in the *Burlington* for last October; Cardinal Don Fernando Nino de Guerva, by Il Greco; and the bull-fighter Pedro Romero by Goya. The photogravure frontispiece after Rembrandt's Scholar is the only reproduction of the seven that gives much notion of the quality claimed for the pictures, which are said to be of first rate importance. It is plainly superb, but the Hendrickje, as here presented, looks formless, while the two pictures by Hals look toneless. The Greco seems strange as to both drawing and values, but is a vivid piece of characterization. The Bull Fighter shows Goya at his sanest and best. Besides the pictures, there are ten pages of illustrations of furniture, vases, etc., which are also a part of Mrs. Huntington's acquisition from the same collection. In the same number Dr. A. Koester writes of two recently discovered Greek statues: an ancient copy of Myron's Discobolus, much finer than any copy previously known and a nearly uninjured Niobid of the fifth century B. C. The other illustrations are from Raeburn's portrait of Mrs. Murchison, in the Museum of Budapest, and Lawrence's much cleverer but less genuinely attractive portrait of Mrs. Alnutt.

Of the series known as Klassiker der Kunst in Gesamtausgaben, edited by G. Gronau, and published by the Deutsche Verlagsanstalt, Stuttgart and Leipzig, the tenth volume has appeared, entitled "Correggio, des Meisters Gemälde in 196 Abbildungen"; and the eleventh volume, containing 277 reproductions of the works of Donatello.

The "Dictionnaire du costume," by Maurice Maindron and Maurice Leloir, is an expensive publication in numbers, making five volumes of 600 quarto pages each, with 5,000 engravings in the text and 300 inset plates, of which 200 are in colors. The Paris price is 500 francs, or 10 francs a number. It is the outcome of twenty-five years' work on the part of the authors, and comprises clothes, armor, jewels, portable utensils, and fabrication and history. An effort has been made to reproduce unpublished objects existing in private collections. Maindron's historical romances, in which he shows himself an archæological Dumas, and his writings on armor guarantee the text, while Leloir's artistic reproductions are quite as favorably known.

No photographer of paintings exceeds in skill Dominic Anderson of Rome, and none has ministered more intelligently to the needs of students. Accordingly we welcome heartily the new alphabetical catalogue of all his photographs—"Catalogue général des reproductions photographiques publiées par D. Anderson" (Rome, 1907). The pamphlet runs to nearly three hundred pages. Paintings are listed alphabetically by authors; sculpture, architecture, and views alphabetically by places. The frequent difficulty of conflicting attributions is met by a double entry, and—a convenient feature—the name of the critic responsible for the ascription is added in parenthesis. This sensible method may be studied in such debatable lists as Masaccio and Masolino. Space fails us to characterize this catalogue in detail. Suffice it to say that it includes the Prado virtually complete, while an examination of such items as Lorenzo Lotto, Pintoricchio, Tintoretto, will give an idea of its scope. Apart from its obvious uses it will serve as a finding list of first resort. We learn that Mr. Anderson will soon publish paintings of the National Gallery, of the Cook Collection, Richmond, and drawings in the British Museum. There is in progress also an édition de luxe of phototype reproductions of drawings by Goya in the Prado.

The question of making breaches in the walls of Rome, to which allusion was made in the *Nation* of January 23, has taken a new development. The Syndic has been induced to inspect the walls and decide definitely on the advisability of any further demolition. As a result of this visit of inspection it has been settled that no more openings shall be made in the wall between the Porta Pinciana and the Porta Salaria; that the three arches in the Via Piemonte shall be left as they were; and that a new archway shall be made in place of the breach near the Porta Pinciana.

The National Arts Club is holding an exhibition of work by contemporary painters, to close February 15. Among the exhibitions at the dealers' galleries in this city are paintings by Gari Melchers at Cottier & Co.'s, till February 21.

David Johnson, the landscape painter, died January 31 at Walden, N. Y. He was born in 1827, and was one of the last survivors of the "Hudson River School." He was elected an associate of the National Academy of Design in 1861, and in 1863 a member. He was winner of a medal at the Centennial Exposition in 1876.

Finance.

THE RECENT BANK SUSPENSIONS.

At the close of last December, the comptroller of the currency said:

> From October 20 to December 30, 1907, there have been but sixteen suspensions or failures of national banks. Of these, two have resumed, and several more should do so in the very near future. Contrast this with the panic of 1893, when 160 national banks failed and of these fifty-four were never reopened.

This was encouraging. But in New York city, where practically no bank failure occurred in 1893 as a result of panic, the suspensions in October of one national bank, four trust companies, and six State banks, has within a few days been supplemented by the failure of two national and two State banks. The National Bank of North America, which closed its doors last week Monday; the National Bank of New Amsterdam and the Mechanics and Traders' Bank, which failed to reopen Thursday; and the Oriental Bank, which was closed by the State banking superintendent Friday, were not important institutions. The four of them had only $5,750,000 capital; their joint deposit fund, even before the October panic, was only $35,700,000, and was barely half of that sum when they suspended. Nevertheless, the fact of the suspension remains, and emphasizes the contrast between 1893 and 1907, in the banking mortality of New York city and the rest of the country. What is the meaning of it?

In recent years, many New York banks have fallen under the control of an audacious coterie of speculating capitalists, one of whom, a few years ago, practically owned five national and four State banks of this city. The *modus operandi* was to buy shares in one bank, pledge them with another bank for a loan, use the proceeds to buy shares in yet another bank, and so on. It was a remarkably inexpensive operation at the outset; and it was used, as might be supposed, to obtain access to funds for the personal ventures of the ingenious promoters. In October, eight banks and at least two trust companies were dominated by this group. But when the loan account of moderate-sized banking institutions was crowded with the collateral of these speculators, the managers of the banks found a great difference between breasting the waves on the crest of a financial and industrial "boom," and keeping afloat in a time of panic. It was connections of this sort, direct or indirect, in the past, which brought about the latest failures. The reason why the banks survived the panics, was that the other banks of the Clearing House kept them afloat by loan certificates; and that so long as restriction of cash payments to depositors prevailed, no "run" could bring the crisis. But resumption of cash payments furnished the test The banks could not stand alone, and the Clearing House Committee reasoned that, continuing assistance, when the panic and hoarding mania no longer existed, would simply encourage new depositors to entrust their money to shaking concerns.

These four bank suspensions throw a singular light on the plea for the guarantee of bank deposits, by the government or by all the other banks combined. It is not difficult to imagine the enormous advantage which such a law would have conferred on the "chain bankers." The one serious obstacle in their way, which ended in their overthrow as an influence in the New York banking community, was the distrust of their schemes by depositors. Had these depositors been guaranteed against any possible loss, the "chain bankers" would quite possibly have been in the saddle today, pursuing their personal schemes with depositors' money.

"The Finances of Cleveland," by Charles C. Williamson (Columbia University Press, The Macmillan Company, agents), is a careful study in municipal finance. After considering the organization of the government and the methods of financial administration, Mr. Williamson treats in ample detail the revenues, expenditures, industries,

and debt of the city. The story is not different from that of the majority of our larger cities. Expenditures and debts have steadily increased, rapidly at some times—as between 1865 and 1875—and more slowly at others; industries have been conducted in unbusinesslike fashion, hut with marked improvement in recent years; and, in general, the city has clung to imperfect and antiquated methods which would have hankrupted any business corporation in short order. The chief defect in the monograph is that the author nowhere undertakes comprehensive discussion and criticism of the entire financial policy pursued in each period of the city's history. We learn in one chapter that expenses have increased; in another we find an account of the revenue system; in still another we come to the history of the city's deht. But we are left to discover for ourselves the natural divisions in the financial history of Cleveland, and to piece out, as hest we can, our own account of the financial policies of each period. The author has devoted much labor to the details of a prohlem, hut has nowhere grasped the problem itself in its entirety.

A NEW DE MORGAN NOVEL

Somehow Good

By the author of "Joseph Vance" and "Alice-for-Short"

The hero, during a complete suspension of memory and loss of identity, accidentally finds a strange shelter. This situation, when met, seems very simple, but the developments are far from simple, and form a story of complicated motives and experiences which holds the reader closely.

An almost grown-up daughter, ignorant of the situation, heightens the tension of the plot, and furnishes her share of two charming stories of young love.

"Somehow Good" is, in the unanimous opinion of the publishers' readers, an advance upon anything of Mr. De Morgan's yet published. 565 pp. $1.75.

NOW READY

The Prolongation of Life

OPTIMISTIC ESSAYS

By ELIE METCHNIKOFF, author of "The Nature of Man," etc.

8vo, Illustrated, $2.50 net

This book has been written avowedly with the object of combating an assumed pessimism of to-day, of giving to unhappy beings called men, who have nothing to look forward to except a life of struggle against diseases and poverty, "senescence," decay and death, some ancho of optimism to lay hold of, some ideal to strive for. This ideal is in this book discussed and defined with an ability only to be expected from a scientist who had attained the world-wide reputation in his special subject of pathology and biology. The succeeding chapters are of remarkable interest not only to the man of science, but to the ordinary reader.—*The Spectator.*

A SERIES OF TWENTY-TWO LECTURES

descriptive in untechnical language of the achievements in Science, Philosophy, and Art, and indicating the present status of these subjects as concepts of human knowledge, are being delivered at Columbia University during the present academic year by various professors chosen to represent the several departments of instruction. These lectures will be published by the Columbia University Press separately in pamphlet form, at the uniform price of twenty-five cents, carriage extra.

Mathematics, by Professor C. J. Keyser
Physics, by Professor E. F. Nichols
Botany, by Professor H. M. Richards
Geology, by Professor J. F. Kemp
Astronomy, by Professor Harold Jacoby
Physiology, by Professor F. S. Lee
Anthropology, by Professor Franz Boas
Zoology, by Professor H. E. Crampton
Economics, by Professor H. M. Seager

are now ready. The others are immediately to follow. Orders will be taken for the separate pamphlets, or for the whole series as they appear.

CLEVELAND, O.

WHAT WE ARE DOING FOR LIBRARIANS

We now have the most efficient department for the handling of Library orders.

1. A tremendous miscellaneous stock.
2. Greatly increased facilities for the importation of English publications.
3. Competent bookmen to price lists and collect books.

All of this means prompt and complete shipments and right prices.

THE BAKER & TAYLOR CO.
WHOLESALE BOOKSELLERS

Just Published

Burnet's Laboratory Manual of Zoölogy

50 Cents

The experiments take up the study of thirty-two typical specimens, easily obtainable in any locality. Special detailed studies of the crawfish, the grasshopper, the earthworm, and the frog are given. Sections are also included on the use of the compound microscope, physiological chemistry, oxidation, foods, diffusion and osmosis, digestion, circulation, and tissue cells.

AMERICAN BOOK COMPANY
New York Cincinnati Chicago

The Most Comprehensive Chronology of the English Sovereigns

Ever offered. Gives the relations of the royal houses at a glance from Alfred the Great to Queen Victoria. A guide of exceptional value for Library or Class Room.

W. J. ROLFE says: "It condenses a wonderful amount of chronology and history into small space. I shall take pleasure in commending it to teachers and students as I find opportunity."

Professor HART (Harvard) says: "I have never seen a chart which brought out as clearly the relation between the various royal houses of Great Britain. It has the further merit of not being overloaded with detail."

The Nation.

NEW YORK, THURSDAY, FEBRUARY 13, 1908.

The Week.

Any one who thinks our American business men lack idealism and childlike faith should read the report of what the delegation from the American Manufacturers' Association did when it went to Washington last week to talk tariff reform. Here are two of their formulated policies:

> (1.) The intelligent, thorough, and unprejudiced study of facts;
>
> (4.) The adjustment of the tariff schedules so that they shall affect all interests favorably and equitably without excessive or needless protection to any.

And to secure these objects they petition, of all people in the world, the Speaker of a Republican House of Representatives and the chairman of a Republican Ways and Means Committee. Mr. Cannon spoke bluntly about the tariff commission plan. No one knows better than he that such commissions stand only the slightest chance of being any more useful than debating clubs, and that the historic commission of 1882 made a report "so voluminous that it was never even read." When the Ways and Means Committee does act, it wants, and is entitled to have, first-hand testimony. But all these are only subsidiary questions. Does any one seriously suppose that our Republican Congresses have been merely waiting for information all these years they have refused to revise the tariff? Information is not hard for Congressional committees to get, least of all the kind which has governed the making of former protective tariffs, namely, information as to how heavy the duties each special interest wants. The Republican party has let the tariff alone because it was paid to, and, as Mr. Cannon truly said, it is exclusively responsible for its legislative policy.

Striking evidence of the "state of nerves" into which the country has got is furnished by the number of ordinarily calm and cool-headed men who are now going about filled with unconcealed apprehension. What they are afraid of is not hard times, but hard knocks. It is not bad business that they dread so much as crazy legislation. People say that these are critical times; there is great excitement throughout the country; a Presidential election is impending; rival political leaders are bidding against each other for the votes of visionaries and revolutionists. So, they infer, some dreadful thing is going to happen. The sounder inference would be that nothing whatever is going to happen. Consider the present settled purpose of Congress to give no heed at all to the President's message. Not a handful of Republicans in both houses could be got to say publicly that they approved of it. That the measures of legislation which it urged will receive no attention whatever, is conceded by all intelligent correspondents at Washington. Indeed, there is no certainty that the President himself either expects or desires Congress to do anything. Whatever his message was intended for, it was not planned to result in immediate legislation. There are still courts in Washington. There is still a dominant number of steady and cautious men in Congress. They will not be raided, and they refuse to be terrified. Nor is there any reason to believe that the mass of the people have a wish or purpose except for corrective and healing laws. All this being so, our apprehensive business men should pluck up their spirits. It is for those who have the serious tasks of keeping the industry and transportation of the country going, to bear in mind the powerful forces which make for stability and sanity, and not to tremble at the thunder of the captains and the shouting.

Senator Culberson's attack on Secretary Cortelyou's measures of last October and November contain several distinct specifications. His charge of violation of the law by Mr. Cortelyou, in the sale of bonds and notes when the Treasury was not in need of money, and in the acceptance of the 3 per cent. notes as a basis for new bank circulation, is the same criticism which was made in these columns at the time. Mr. Cortelyou's recent answer to the Senate inquiry plausibly defended the sale of Panama Canal bonds, on the ground that the entire proceeds have been expended on the canal work. But his argument for the 3 per cent. notes, when the law authorizes their use only in such sums "as, in his judgment, may be necessary to meet public expenditure," and when the Treasury had, as a matter of fact, $230,000,000 on deposit in the banks, was not at all convincing. Furthermore, since the National Bank Act requires deposits of United States bonds as security against circulating banknotes, and since it further expressly declares that "the term 'United States bonds,' as used throughout this chapter, shall be construed to mean registered bonds of the United States," the use of one-year 3 per cent. certificates of indebtedness was plainly illegal.

When, however, Senator Culberson denounced Mr. Cortelyou's deposit of public moneys in bank last October, he fell into a series of blunders. Dilating on the share of such deposits allotted to New York banks, Mr. Culberson points out that according to the Comptroller's reports, the amount owed by New York banks to all other national banks decreased, between August 22 and December 3, only $10,820,511. This, he alleges, was all this city's banks paid to outside national institutions, although the loans of the New York banks in the same period increased $63,000,000. But the figures, as presented by the Senator, are misleading. The "amount due to other national banks," referred to, does not rise or fall solely according to receipt or shipment of currency at New York. On the contrary, a Western bank which has been lending its money directly on the New York market and which calls in the loan—as hundreds of banks did at the panic time—converts the proceeds into a deposit in a New York bank; thus, on the face of things, increasing the amount which this city's banks owe to other institutions. Senator Culberson's decrease of $10,820,511 "due to other national banks" is, therefore, no criterion whatever of the currency shipments from New York to the interior. Explicit information on that point was given by the chairman of the Clearing House Committee to Mr. Cortelyou, and was published in the Secretary's reply to the Senate inquiry. It showed that, during the panic period from October 21 to December 7, the New York banks shipped to the interior $106,921,700 more currency than they received from it. These figures Senator Culberson cannot honestly ignore. As for the $63,000,000 increase in New York bank loans on collateral, of which the Senator makes so much, he surely ought to know that when interior banks recall their own Wall Street loans with sudden violence, the burden of sustaining the credits involved is shifted necessarily to the New York institutions.

Mr. Bryan expounding as something entirely new a very old economic theory, which he himself has just discovered and imperfectly mastered, is not an unfamiliar spectacle. Even before his unlucky experiment with the idea of government ownership of railways in 1906, his achievements in this regard had somehow created the impression of a politician hastily running over the pages of a politico-economic text-book, to see if something might not turn up which could be used as an "issue." His remarks to the Civic Forum in this city last week, on the "ideal monetary system," touch the foundation of things in the same light-hearted way. That system, he tells us, "would be one in which the purchasing power of the dollar remained the same yesterday, to-day, and forever." He finds that his plan of 1896 for the sudden injection into our currency system of the whole of our own silver product, and a good part of that of other nations, would have made for this stability of "purchasing power." Following the same line of thought, he finds some amusement in the fact that people who objected to "my silver dollar" at that time, have now adopted cashiers' checks and clearing-house certificates instead. We do not know whether Mr. Bryan imagines that the panic expedients referred to were adopted as a permanent addition to the currency, to make good an insufficiency in gold production; but such a supposition would be necessary to his argument.

The State Labor Department's bulletin, which fixes with some approach to accuracy the real proportions of our much-discussed army of the unemployed, shows, as might be expected, that more men were out of work at the end of December, 1907, than on the corresponding date of the years preceding. The 92 labor unions reporting in this city had 34.2 per cent. of members idle on December 31, while, with a slightly smaller number reporting, the percentages were 12.8 in 1906, 6.7 in 1905, and 17.8 in 1904. Relatively, twice as many men are out of work, then, as in the worst of these years, five times as many as in the best year. Bad as these figures are, however, it is clear that New York city is to-day housing much more than its due proportion of the unemployed. Social workers report that many of the idle men here have drifted in from the smaller manufacturing centres. The merit of the proposed labor-colony plan for the solution of the problem of the unemployed in this State is that it offers a remedy that is permanent, and that involves coöperation on the part of the beneficiary. The obvious defects of the plan are such as appeared in England during the distressing winter of three years ago, when a colony for London's unemployed was founded on land granted for the purpose by an American. The primary object of maintaining a comparatively small number of destitute workmen was, of course, attained, but at an expense, we believe, that did not make the experiment a success from the point of view of practical economics. In a recent undertaking of the borough of West Ham, for example, a product estimated at £7,397 cost £10,135. It was found that the lower-class city laborer and the workman chronically unemployed made a poor showing, though it is only fair to say that malnutrition and illness had done much to reduce the capacity for work, even where the desire existed. How an agricultural colony can, in general, bring speedy relief to the urban workman in need of work, is not easy to see.

Ray Stannard Baker, who contributed to the *American Magazine* several articles on the negro in the South, has begun in the current number a new series dealing with the color line in the North. This bids fair to be of great service, for the negro problem is a national one; and in some of its aspects, as in the matter of obtaining work, the North is harder upon the colored laborer than the South, where labor unions are as yet of comparatively slight importance. Signs of militant prejudice have never been lacking in certain Northern States. The draft riots of 1863 in New York had, as will be remembered, chiefly colored victims. Only three or four years ago the police of this city disgraced themselves by an outrageous assault upon inoffensive colored people because of the act of a negro criminal in shooting a policeman. That there was not a lynching in our streets at that time was merely a matter of luck. In all the large cities of the North, notably in Indianapolis and Philadelphia, the problem daily forces itself more and more upon the attention of philanthropists, charity workers, and police authorities. When indiscriminately herded together, negroes who are suddenly placed amid all the temptations of the city, after being accustomed to rural life in the South, are easily led astray. The change in climate, the difficulty of obtaining decent quarters at the same rents asked of white tenants, the exploitation of the race by demagogic politicians, and by dive- and saloon-keepers tend, as Mr. Baker points out, to make the negro districts, or settlements, danger spots. Industrially, the chief difference, as Mr. Baker shows, is that in the South the complaint is of a lack of efficient negro labor; in the North the skilled negro finds it difficult to get work on any terms. The places where the negroes are best off, Mr. Baker finds, are the smaller cities of the North and West, where they are still few in numbers. The negro people need to-day a strong incorporated national committee for the furtherance of the welfare of the whole race. Such a committee would be able to receive gifts. It could buy land for negro settlers, and in improving the health of the race open new channels of industry, develop schools and churches, agitate for the restoration of civil rights where they are denied, and furnish the best legal skill for the testing of unjust laws.

It has been alleged that too much athletics in college tends to dwarf the reasoning powers of ingenuous youth. This may have been in the minds of the Williams trustees when they voted to cut down the schedule of intercollegiate contests. But it is all a mistake. If any frank man will consider the following passage from the *Williams Record*, in an article on "The Anti-Athletic Policy," he will be forced to admit that it is a magnificent display of the imaginative faculty as applied to logic:

> Followed to the letter, this policy will mean the isolation of Williams. With, at best, only semi-occasional visits of representatives of other colleges, and with a very infrequent Williams representation at other colleges, the broadening effect of contact with other college men will have ceased almost entirely to operate. The benefits of intercollege mingling will thus be forfeited to the ideals of high scholarship. Williamstown may, indeed, be an ideal place for concentrated study, but it lacks the qualifications of a place adapted to the combating of a narrowness which will be apparent when there is only very infrequent association with other institutions.

This keen observer, who has noted the "broadening effect" of being one of the cheering crowds at football matches, with the benefit to "the ideals of high scholarship" to be had from joining the roistering throngs after the game, deserves high place among the discoverers of the age.

The debate between Lord Curzon and Lord Cromer on the recently concluded Anglo-Russian convention with regard to Central Asia, shows how treaties may be taken by the spirit or the letter. To Lord Curzon the agreement was a failure, because its results for Great Britain were "doubtful in respect to Afghanistan, bad in respect to Tibet, and worse in respect to Persia." That was a weighing of clause against clause and article against article, which may be made to show anything. The question is whether Great Britain and Russia, in coming to terms, wished to let their differences in Central Asia rest for a little while, or not. It does not matter what the distant aims of either party to the contract may have been. Possibly, within fifteen or twenty years, Russia may feel herself prepared to resume her advance on India, and Great Britain may have found another partner. Nevertheless, for an appreciable number of years, the recent agreement will hold, if, for no other reason, because it took years to prepare for it and years to bring it about. It is all very well to speak of treaties as not being worth the paper they are written on, but, after all, nations outside of Central America do not change their minds in a day. British opinion probably now finds the Japanese alliance irksome; as Lord Cromer said, the Anglo-Russian convention may have been a preparatory step towards loosening Britain's connection with Japan. Yet admitting all that, it will take years before the Anglo-Japanese treaty can be quite dissolved. The interests which made it desirable cannot all disappear in a day; the forces opposed to it cannot all develop in a day. And that is why we take with mitigated seriousness the rapid political combinations and recombinations that the cable brings us.

Talk of war between Russia and Turkey over the Persian boundary dispute is taken in some quarters seriously. The quarrel is of nearly a year's standing. Difference of opinion between Turkey and Persia as to the frontier line in the north was followed by what Persia has designated as invasion of her territory by Turkish troops. The Porte, on the other hand, asserts that its soldiers have not crossed the true boundary line. That line was established, after long years of dispute, by the intervention of Russia and Great Britain. Hence Russia's present activity as the champion of Persian rights and the guarantor of peace in the Caucasus. Great Britain's silence in the matter may be taken as the result of the recent agreement with Russia by which northern Persia was assigned to Russia as a particular sphere of influence. History shows few examples of national altruism comparable with Russia's unselfish interposition in behalf of Persia, whose internal condition would make her an easy antagonist of Turkey. At the very moment when Russia's Manchurian generals are on trial for their lives, charged with cowardice and incapacity, when internal discontent is by no means suppressed, when famine rages among the peasantry, the Czar would intervene to save the Persian lamb from the ferocious Turkish tiger. Or has the old policy of distracting attention from domestic troubles by seeking foreign adventures once more asserted itself at St. Petersburg?

The recall of the French Ambassador at St. Petersburg on the request of the Russian government, was necessitated, so it is reported, by a letter of the diplomat, which fell into the hands of the Russian police, and which it would be mild to call indiscreet. The famous Sackville-West letter contained nothing approaching in frankness M. Bompard's remarks on the Russian court and ruling circles:

> The bureaucracy, court, and clergy are leading a prodigal and debauched life. . . . The expenses of the court of the Czar Nicholas and his grand dukes are twice as much as the Russian Government provides for the education of the people.

St. Petersburg's conservative circles have been calling the French Ambassador a Jacobin and a mannerless parvenu, and the fact that he was appointed to his present position under the Premiership of M. Combes, the Pope of Free-Masonry, as the French conservatives call him, might be taken to account for his Radical sympathies. At the same time, the incident shows under what difficult conditions an alliance like that between France and Russia may exist, and even be vigorously defended as it was by André Tardieu, an unquestioned authority, the other day at Harvard. In France to-day republicanism and secularism are all-powerful, and so radical a gospel as Socialism is an important factor in political life. Paris is still the city of cosmopolitanism and advanced modernity. What Russia and St. Petersburg of the present day are, needs no re-statement. Yet a common fear holds the most advanced and the most backward nations of Europe together.

The expatriation bill now before the Prussian House of Lords confesses the inability of the Prussian government to assimilate, after more than a century of effort, its Polish subjects; it admits the total failure of the effort to crowd them out by colonizing Prussian Poland with the pure German stock; it reveals the Chancellor as grasping as a last resort at forcible expulsion. Poles have been deeply rooted in these Prussian provinces for centuries. When the Prussian government undertook to buy these lands as opportunity offered, it thought that $25,000,000 would suffice to carry the scheme of colonization well towards fruition; but another $25,000,000 was soon called for, and then $62,500,000. But despite the expenditure of this treasure, despite the construction of whole villages with churches, schools, inns, public buildings, the result is as nothing. Wherever Germans have been settled they have found competition with the frugality and thrift of the Poles difficult if not impossible. This practical failure naturally stirred the Prussian government to fresh efforts. It began making war on individuals. A German major of cavalry who sold his estate to some Poles had to leave the service; officials who showed any favor to the Poles were compelled to accept a transfer or resign. Then came the war upon the Polish school children, who struck rather than say their prayers in German; and later there was introduced a bill which, under the guise of giving greater freedom of assembly to all Germans, struck another blow at the Poles by requiring that within the empire all speeches should be made in German. And now comes the final wrong. To parallel it, the United States would have to expatriate all the Mexican landowners in Arizona, Texas, and New Mexico; or to drive out of New England the French Canadians. Canada, to do a similar wrong, would have forcibly to separate from their farms all whose ancestors followed the star of Montcalm and his predecessors. They, too, have clung to their language, their national traits, and have refused to be assimilated by their conquerors. Yet rare political wisdom has allowed them to rest undisturbed, has granted them full suffrage rights, and allowed them the use of their tongue even in Parliament. Were the guardians of Prussia's policy equally astute, they would have cherished the Poles, won their confidence and friendship, and conceded them both language and customs. But the Prussian Imperialism of to-day has grown more strident, though at the same time less efficient. Conscienceless though Bismarck often was, he yet knew how to use the pride of the several states to weld them into an Empire.

The withdrawal of the Congo annexation treaty for further consideration by the crown is taken as an augury of victory for the opponents of Leopold II. The Belgian Parliament had worked out a satisfactory bill for the government of the colony that the nation was about to acquire, when the terms of the treaty of annexation submitted by the King made the speedy acquisition of the colony once more an uncertainty. The bone of contention was the so-called Foundation of the Crown, the revenues of which, it was stipulated, should continue to be applied to the uses for which the King had hitherto employed them. Such uses were described as "absolutely disinterested and patriotic," consisting chiefly in the creation of imposing public works in various Belgian cities and the support of charitable and educational labors in the Congo. For himself, the King asked "neither indemnity nor repayment," though liberal pensions for various members of the royal family were demanded. It was also required that Belgium should continue the working of the forests in the Foundation; this would mean the maintenance in some form or other of the system of forced labor. The majority in the Belgian Parliament might possibly have been driven by the party lash to accept the treaty, but the approaching general elections would have brought condign punishment. In this situation, the death of the Premier, M. Trooz, and the succession of M. Schollaert, who accepted office free from conditions, have helped to hasten what promises to be an acceptable compromise. That Sir Edward Grey's recent forcible declarations in the House of Commons have also aided, we may readily assume. The struggle has been largely one of principle. Of the Congo's 20,000,000 inhabitants, the Foundation of the Crown holds about 2,500,000, so that, at the worst, Belgium was getting control over fully seven-eighths of the region.

USING THE OFFICES.

President Roosevelt has at last declared himself against the use of Federal offices to control political committees and pack political conventions. He cites his own rule against such official meddling, and writes, in his letter to Mr. Foulke, that "no officer will be permitted to violate the above injunction, with my knowledge." It was not, however, until the proceedings of the Florida Republican Convention were telegraphed over the country, and people discovered that Government employees were neglecting their duties in order to go to St. Augustine and dictate the choice of officeholders as delegates to the Chicago Convention—it was not till then that the President thought it necessary to act.

His explanations on the subject of appointments in Mr. Taft's interest take up only a small part of his letter. The real issue never lay in them. It was not asserted that they amounted to more than a handful. There were four Ohio postmasters. Senator Foraker asserted that they were named to promote Mr. Taft's candidacy; the President replies that they were duly recommended by Representatives. That is, obviously, not a logical contradiction. They might have been urged by Congressmen, and still intended to help Taft in his fight against the Ohio Senators. This matter we must leave for Senator Foraker to elucidate. As for the Wanmaker appointment in this city, the President defends it on the ground that it was recommended by the three Republican Congressmen from New York County. That, again, is not inconsistent with the fact that Wanmaker was made appraiser in order to aid Taft in New York. That this was the understanding of Taft's friends in Washington at the time, is indicated by a special dispatch to one of our good Republican newspapers, stating in so many words that "his selection is looked on as intended to assist the Taft movement in New York."

The President does not deny that Federal officials have been working for Taft, or even that pressure may have been put upon them to that end; he merely says that "if in any such case the accusation is found true, it will have occurred without my knowledge." Nothing is more probable than that over-zealous subordinates of the President's did what they thought would please him, though they did not tell him of it. The charges made by the Boston *Herald* in reference to the orders given Massachusetts postmasters to get delegates for Taft, were very explicit. The orders may have been issued without the knowledge of the President; and if the matter is pressed to public debate in the Senate, we may possibly get more details than Mr. Roosevelt was aware of.

Past occurrences, however, are of less importance than future policy. Is the President really determined to put an end to the gross impropriety of officeholders controlling party conventions and choosing delegates? His answer to the charge that the Florida convention was run by officeholders is singularly lame. The charge was made, he says, by "persons who wish to be put in office." Grant it; but what has that to do with the conduct of those who have been put in office? The rolls of the Florida convention will show how many officeholders were present. It is known that three out of the four delegates elected were Federal officials. In view of that fact, it is of no avail to point out the bad character of those who object to this political use of the offices. The offices were unquestionably so used in Florida.

As for Secretary Taft himself, he must look upon all this activity of Southern officeholders with much repugnance. We know what he thought of its baleful political effects, from one of his utterances before he was an active candidate for the Presidency. Speaking in Greensboro, North Carolina, on July 9, 1906, he displayed, in dealing with the evil of a Republican party in the South run by officeholders, a frankness almost as great as in his arraignment of Boss Cox, the previous year. Mr. Taft referred to the charge that there was no real Republican party in the South—nothing but "a little coterie of politicians who devote themselves solely to the selection of delegates to the national convention, and whose whole object is the securing of the Federal patronage"—and declared that it had "much force and truth." He then went on to say to Southern Republicans:

> You can have no prospect of success and do not deserve success unless you show in the nominees of your conventions and in the men whom you put forward to lead you that you fully recognize the obligation that you are under as a party. . . . You must convince the voters at the polls that you are not merely an office-seeking party. . . . I do not wish to seem ungracious, but I must be candid. In my judgment, the Republican party of North Carolina would be much stronger as a voting party if all the Federal offices were filled by Democrats. . . . The struggle for Federal political office, producing, as it does, jealousies and strifes and disappointments, paralyzes united effort to make the party strong at the polls and worthy of success. . . . As long as the Republican party in the Southern States shall represent little save a factional chase for Federal offices, we may expect the present political conditions of the South to continue.

The man who spoke those pointed and honest words less than two years ago, cannot be entirely happy to see himself now made the beneficiary of the "factional chase for Federal offices." No one can suppose that Mr. Taft desires to be nominated for the Presidency by a mercenary army of Southern officeholders, supported by delegates from a few Western States and the Territories, while the great body of States that cast Republican electoral votes is against him. For our part, we can conceive of no way in which he would more strengthen himself with the country than by coming out bluntly against the interference of Federal officeholders in politics, whether they be for him or against him. The whole thing is abhorrent, and Mr. Taft ought to side with those who would exclude it utterly from our political life.

SOCIALISM UNDER DEBATE.

It is not necessary to connect the capture of the English Labor party by the Socialists with the rioting of the workmen in Berlin or the unrest among the masses in Portugal. The event, taken by itself, is of sufficient significance. At the conference of the party at Hull a resolution that the organization declare as its "ultimate object" the "overthrow of the present system" was first voted down by 951,000 votes to 91,000 (each delegate's votes are proportioned to the membership of the society he represents). The very next day, by a vote of 510,000 to 469,000, the conference adopted this resolution:

> That the time has arrived when the Labor party should have as a definite object the socialization of the means of production and distribution and exchange, to be controlled by a democratic state in the interest of the entire community, and the complete emancipation of labor from the domination of capitalism and landlordism, with the establishment of social and economic equality between the sexes.

If this be not radical enough to satisfy extremists, it is at any rate a pretty complete surrender to the Collectivists.

Yet this step, which has excited so much comment in England and on the Continent, is in the direct path which the Labor party has long been treading; for, though English workmen have lagged behind the Germans and the French in the movement toward Socialism, they have kept well ahead of the Americans. Indeed, to many of the policies which were formerly denounced as socialistic, both of the old parties in England are more or less committed. With municipal lighting plants, for instance, which in this country are generally regarded with disfavor, or at least with doubt, the English cities are experimenting freely. Government intervention between employers and employed in settling disputes—as in the recent threatened railway strike—is applauded by Conservative and Liberal politicians alike. Then, too, the leaders on both sides are bidding for the workingman's vote by offering old-age pensions—something that in America would be looked upon as wildly socialistic. In fine, Englishmen of all political creeds have gone farther than Americans both in those socialistic projects in which the difficulty or impossibility of competition offers an alternative between private and public monopoly, and in those which are largely supported by humanitarian sentiment. The mere word *Socialism* is ceasing to be a bugbear. Party chieftains admit frankly that they are no longer afraid of the naked principle of Socialism. The only thing they ask is whether any particular undertaking seems practicable and desirable in itself. The fear that it may be the small end of the wedge seems less disturbing than on this side of the Atlantic. This attitude is, on the whole, typical of the English temper, with its contempt for abstract notions, doctrinaire views, and paper theory—the practical temper which Burke exhibited when he declared:

> It is a very great mistake to imagine that mankind follow up practically any speculative principle, either of government or of freedom, as far as it will go in argument or logical illation. We Englishmen stop very short of the principles upon which we support any given part of our Constitution or even the whole of it together.

This temper of the English renders it doubtful whether the formal adoption of a resolution by the Labor conference will have at present any striking result. The most ardent Socialist must see that the "socialization of the means of production and distribution and exchange" is as far off as ever. The agitators for that end may be somewhat stimulated and encouraged, socialistic proposals may receive somewhat more attention in the public press; but for the great minority of the workmen—perhaps even a majority—old-age pensions seem likely to remain the goal for a long time to come. We are bound to admit, however, that a quickening of the socialist propaganda in England may also be reflected, even if faintly, in America; that lively discussion of socialistic ideas by English-speaking people on one side of the ocean may find some echo here—especially in a period of business depression. In the next decade we shall probably hear a good deal about the beauties and benefits of a régime under which nobody is to be overworked and everybody is to be rich and happy.

Convinced though we are that the reasoning of the socialists is fallacious, we incline to the belief that a socialist agitation may in the long run prove beneficial to this country. We were opposed to the free coinage of silver, and yet we are convinced that the two great political campaigns in which that subject was treated so fully in the press and on the platform were extremely valuable in their educational effect. Thousands, nay, millions, of men and women who had grown up without the slightest notion of economics in general and finance in particular, became fairly well versed in the topic; they were made more intelligent and better citizens; and in the end they sustained the principle of sound money. In like manner Socialism may be the means of widening intellectual horizons; it may lay before Americans a new view of some of the larger questions of life—far larger than the petty tenets of trades-unionism. It may set us to thinking; and the salvation of a republic depends upon the efforts of its citizens to think seriously about its affairs. For one thing, Socialism is eminently a peace movement; it is steadily opposed to militarism; and it will thus help us to see more clearly the silliness of the huge naval and military expenditure in which we seem bound to rival the groaning nations of Europe. And as for other questions—we cannot believe that error will permanently prevail over truth. We are confident that individualism, in its main features, is the policy which has formed and which must preserve our institutions. But if we conservatives are mistaken, we cannot but welcome a discussion which shall open our eyes and set us right. Our attitude toward this topic, as toward any other which touches the vitals of our nation, must be that of readiness to defend our faith in open forum, to meet and conquer reason with reason.

CRIME AND THE READER.

The popularity of police reports and detective fiction does not seem to be always understood. It has, however, a natural explanation. A saleslady supping upon the horrors of the yellow press, and a FitzGerald regaling himself upon the Newgate Calendar, are satisfying the same normal appetite. For in the book of crime we all have the satisfaction of beholding our free and primitive selves in action. There is nothing to be said for vice; but killing and stealing are robust acts which man has always condemned and men have always exulted in. So far as action is concerned, we have sold our birthright, or rather we have come to a convenient agreement not to exercise it as individuals. Except in time of war, the killing of our neighbor and the appropriation of his goods are achievements we deny ourselves for the tedious good of the greater number. But we are all potential sleuths, hard upon the trail of the individual offender, as well as potential jurymen, ready to find him guilty in view of all the evidence. Tom, Tom, the Piper's son, stole a pig and away he run. Ten years at hard labor! Who killed Cock Robin? To the gallows with him, the dastard! So goes cheerfully up to heaven the chorus of husbands, fathers, and fellow-citizens. Yet every man-Jack of us has a sneaking sympathy for Tom, and a more or less critical admiration for the murderer of that somewhat tiresome bird. Who is really insensible to the charm of this vicarious activity?—every man in fancy his own murderer (or shall we say blood-avenger?), every man in his dreams not robbing a till, but heroically bagging a Kohinoor. No wonder the fiction of crime is popular.

Sensible persons, consequently, do not sneer at the detective story as an institution any more than they sneer at melodrama. These are, of course, special and highly developed forms of literary and dramatic expression. The candid mind has only to perceive what their function is, and how well they perform it, to clear itself of false shame in the enjoyment of them. They are equally conventional forms, but the laws which govern them are quite unlike. From the melodramatic point of view, crime is a monster of deadly mien, which to be hated needs but to be seen. It is held before the disapproving eyes of the spectator only that he may be properly prepared to gloat over its eventual payment of the price. Virtue is supposed to be the real mistress of our thoughts; it is our joyful duty to guard her honor from the lightest stain, and to concede to vice no single lineament of her. A heroine with a cigarette is as unthinkable as an adventuress without one. The villain cannot help wearing his hat over his eyes, and the hero could not do it if he tried.

But if melodrama gratifies the juryman in us, detective fiction appeals primarily to the old Adam. Or, rather, we are doubly involved in the affair. Morally the criminal, intellectually we are the master mind which runs him down. It is an exciting game. We do not demand extraordinary novelty or ingenuity of ourselves in either rôle. So far as the crime is concerned, the fact, the mode, can hardly be too simple. Recent practitioners have exercised a good deal of needless ingenuity in the matter. One author uses a snake, another a malarial mosquito, another a subtle gas caused to emanate from the stolid foliage of the harmless, necessary rubber-plant. All this is to paint the rose. The spoonful of rough-on-rats, the obtuse brick, or the bare bodkin serves perfectly well. And the fact of crime needs no particularly subtle garnishing of mystery to lure us on. A little confusion of clues and scents is all we require. Even the great Sherlock's famous "deductive" method is mainly wonderful as we see it mirrored in the round eyes of the solemn ass Watson, and contrasted with the clumsy manœuvres of the idiots of Scotland Yard. His method, with all its pomp is the ageless method of keeping one's eye peeled and adding two and two. The test is a test of common sense applied to uncommon data. One recalls the bewildering multiplication of possible clues in "The Murders in the Rue

Morgue" by the various depositions at the coroner's inquest. The man who gets to the bottom of the matter is the man who refuses to let his imagination lead him away from the few undisputed facts. The story, as it happens, is a little compromised by the eventual discovery that there has been no crime at all. There is a certain pathos in hunting down our man and finding him a monkey. After all, we have been defrauded of our murder; it is not pleasant to have wasted the sympathy due to a fellow-being upon a mere brute. The true formula does not vary: the thing has been done, and the main questions are, Who did it? and, How do we know he did it? How he did it is a matter of secondary importance; and why he did it is a question the answer to which may be found in the bosom of any natural man.

DONALD G. MITCHELL.

I.

There was a time not so long ago when the "Reveries of a Bachelor," and perhaps "Dream-Life," stood on the shelf of every college sophomore, the gift of some gentle friend. 'Twas a pretty custom, as if the donor with furtive fingers were knocking for admission into these mysterious masculine quarters, and would hint with sly bashfulness that a young bachelor's idle thoughts should properly turn to matrimony. Well, the sophomore and his maid, I am told, have grown a little ashamed of this peculiar form of sentimentality; yet the writer of the "Reveries" may take confidence in denying, as he did in a recent Preface to his book, "that the boisterous and scathing and rollicking humor of our time has blown all of pathos and all of the more delicate human sympathies into limbo." I do not know certainly what author now acts as go-between for the tender approximations of youth—Dr. Henry van Dyke, I dare say, or some other licensed caterer *virginibus puerisque*; the fashion of taste changes, and old favorites are discarded, but there remains the audience, "forever panting and forever young."

The real danger is that the name of "Ik Marvel," the dreamer, should quite eclipse the more substantial author, for it is true that Mr. Mitchell, as he says rather plaintively, has "written very much better books, every way, since that time," though the world of book-buyers will not hear it. Perhaps the handsome new edition of his works* will bring that fickle world to its senses. I hope so, for Mr. Mitchell represents that rare figure in American letters, the gentleman amateur, whom it is good to honor. Yet it must be confessed that a full half of his volumes are but tenuous things to stand against the trade-winds of oblivion. One cannot feel easy, for instance, about those six volumes of light talk on English and American literature. One might recommend them as pleasant schooling for the young, were it not that Mr. Mitchell shows the amateur's dread of stating simple facts. They presuppose too much knowledge for the beginner, and they are not solid enough critically for the mature. Nor can one be quite sure of his fiction. I profess myself able to read "Dr. Johns," at least the greater part of it, with a kind of pious delight, but I am doubtful of its power over those who have not been baptized in the clear, cool springs of New England tradition. Too many readers, I fear, will be like the sinner of the story, who wrote to the saintly minister from his wanderings:

> I shall never forget the cheery joyousness of that little family scene at your fireside, the winning modesty and womanliness of your lost Rachel, and the serenity and peace that lay about your household. It was to me, fresh from the vices of Europe, like some charming Christian idyl, in whose atmosphere I felt myself not only an alien, but a profane intruder.

The first half of the book is indeed a charming Christian idyl, belonging to that little backwater from the world's current where frail plants open and send out their aroma and fade away in the still shade. It requires more intellectual abstinence than most of us possess to relish fully the savor of this old idealized New England. The passions of life have no place in this sheltered retreat, and when in the course of events these break upon the scene the tale loses its amulet of reticence and becomes only futile.

II.

It is by his more personal works Mr. Mitchell will be remembered for a while, by his chapters of European travel and his pictures of country life at Edgewood. He himself has told us how, when little more than a boy, he was called from working an old Connecticut farm to travel abroad. That was in the forties, when Longfellow's "Hyperion" had set a new model for sentimental reminiscences, and it was inevitable that the traveller on his return should shake out his note-books, kept religiously in shorthand, and give the world a volume of "Gleanings." And the book is well worth reading to-day. France and Austria and Holland were still a land of discovery; it was still possible to wonder at the gay wicked life of the Parisians who had no knowledge of "our glorious Saxon home-spirit"; the roads of Illyria led even further into the kingdom of romance than they do now; and the Dutchman was always placid and steeped in tobacco. Your traveller was not ashamed to muse over a bunch of flowers given him by a pretty waiting-maid, as he was bold enough to confess that he had often "drained a good tankard of home-brewed, and felt [himself]—not a whit the worse for it" (only a dash could prepare the reader for the enormity of such a confession). Well, innocence for innocence, sentiment for sentiment, I prefer the sunny romance of Latin and Italian coloring Mr. Mitchell's memoirs to the nebulous fog of Teutonism that drifts through the pages of "Hyperion." That is my foible, if you will, but the companion who can beguile me through Europe with scraps of the classical poets we learned at school, has made me his humble servant forever after. "The clouds thickened gradually into darkness," says Mr. Mitchell at the beginning of his book, "for the sun was down;—*ponto nox incubat atra*—black night brooded on the waters; the very half line came to me, as I sat hugging the low bulwarks, and gasping between the gusts." With so Virgilian a comrade I protest I can cross even the Channel without bickering. And how shall I quarrel with a friend who quotes Tacitus and Juvenal to me at Lyons; or at Vaucluse reminds me of "some heart-killing Laura in his Homeland" in the language of Petrarch—"nelle medesime dolenti parole"; or excuses his surrender of alms to a pretty beggar-maid with the old tag, "Semper causa est, cur ego semper amem"? We have lost this trick of easy, high-bred quotation, and the world is a shabbier place thereby. To go about with Virgil and Horace in one's mind is to travel as a gentleman, and justifies a little contempt for the contemporaneity of the intellectual upstart.

III.

At the age of thirty-three, having travelled extensively, and seen something of consular service, having, in orthodox fashion, jilted the law for literature, Mr. Mitchell bought an estate outside of New Haven and settled down for the rest of his life as a gentleman farmer. The result of this experience we have in three slender volumes "Wet Days at Edgewood," "My Farm at Edgewood," and "Out-of-Town Places"—by all odds his most successful literary work, because here the strain of amateurishness is the very pith and marrow of the theme. And the best of these is the first. One may cavil at his language sometimes, at his "ruralities" and "ruralisms"—horrid words; one may wish that he showed more respect for our ignorance, and dealt more liberally with elementary facts, but, after all, what a delight it is to have so genial an exponent of this long line of farm and garden writers from Hesiod down to the authority of yesterday:

> In that corner of my library which immediately flanks the east window is bestowed a motley array of farm-books; there are fat ones in yellow vellum; there are ponderous folios and stately dedications to some great man we never heard of; there are thin tractates in ambitious type, which promised, fifty years and more ago [a hundred and more, now] to overset all the established methods of farming; there is Jethro Tull, in his irate way, thrashing all down his columns the effete Virgilian husbandry; there is the sententious talk of Cato, the latinity of Columella, and some little musty duodecimo, hunted down upon the quays of Paris, with such title as "Comes Rusticus"; there is the first thin quarto of Judge Buel's "Cultivator"—since expanded into the well-ordered stateliness of the "Country Gentleman"; there are black-letter volumes of Barnaby Googe, and books compiled by the distinguished "Captain Garvase Markhame"; and there is Xenophon flanked by a Hesiod, and the heavy Greek squadron of the "Geoponics." I delight immensely in taking an occasional wet-day talk with these old worthies.

What names and what memories! How Barnaby Googe and Jethro Tull smack of the fat English soil; how deep a furrow of the mind has been left by the effete Virgilian husbandry! And there are other names that take their proper place in the papers that follow—Horace and all the poets who have retired from the city to their *modus agri non ita magnus*, even Boileau, who, according to his gardener, had no eyes for growing trees though he would have been keen enough for the crop if St. Augustine and St. Chrysostom had been planted; Italians of the Renaissance who joined the arts of ploughing and of living; philosophers and exiled princes, and all who have gained the world by losing it. "To be a husbandman," says Cowley, for whom Mr. Mitchell might have found a niche in his long gallery of honor—"to be a husbandman is but a retreat from the city; to be a philosopher, from the world, or, rather, a retreat from the world as it is man's into the world as it is God's. But, since nature denies to most men the capacity or appetite, and fortune allows but to a very few the opportunities or possibility of applying themselves wholly to philosophy, the best mixture of human affairs that we can make are the employments of a country life. It is, as Columella calls it, 'Res sine dubitatione proxima et quasi consanguinea sapientiæ—the nearest neighbor, or rather next in kindred, to philosophy.'"

---

*The Works of Donald G. Mitchell. Edgewood Edition, in fifteen volumes. New York: Charles Scribner's Sons. 1907.

IV.

It is not Mr. Mitchell's literary cunning we admire so much, although he has shown considerable art in weaving together his own farm experiences with these studies of his forebears, and has weighted the whole with allusions to the civil war that, while he wrote, was calling our young men from the plough as it had taken them in the days of Virgil:

> Ne pueri, ne tanta animis assuescite bella,
> Neu partriæ validas in viscera vertite vires.

Yet it is not his art we admire so much as the life he describes. "Nature," he says, summing up the profit of his labors, "has solemnized the marriage of the beautiful with the practical," and inevitably we compare this union of practice and contemplation with the saunterings of Thoreau and Emerson and others, who desired the romantic alone in nature and scorned laborious days. The comparison of their books may be misleading, for the Concord men were far above our gentleman farmer in the persuasive use of words; to make the point clear we should turn rather to more authoritative names, such as Wordsworth and Virgil. What, after all, is the lesson of the "Excursion," and how does it stand in naked veracity beside the "Georgics"? How does that "virgin passion of a soul, Communing with the glorious universe" measure against the Roman's sober sense of toilsome duty? Wordsworth has compressed his reading of life into one melodious stanza:

> One impulse from a vernal wood
>   May teach you more of man,
> Of moral evil and of good,
>   Than all the sages can—

which, be it said with due respect, is good verse but literal folly. Nor does it yet appear a fact that idle wandering in the fields is better for a man's soul than the discipline of Plato and Jesus. Certainly such is not the teaching of Virgil:

> Labor omnia vicit
> Improbus, et duris urgens in rebus egestas. . . .
> Omnia quae multo ante memor provisa repones,
> Si te digna manet divini gloria ruris.

We are but *durum genus*, sprung from the soil, and only through harsh labor and faithful hoarding of experience shall we make our own the glory of the divine country.

V.

And so I return to our lesser philosophers of New England and say boldly that more of the true wisdom of nature is to be found in Mr. Mitchell's story of Edgewood than in "Walden." I know the canniness of Emerson's "Apology":

> Think me not unkind and rude
>   That I walk alone in grove and glen;
> I go to the god of the wood
>   To fetch his word to men.
>
> . . . .
>
> One harvest from thy field
>   Homeward brought the oxen strong;
> A second crop thine acres yield,
>   Which I gather in a song.

But is the implication really sound? Nay. I doubt that the honest ploughman may carry back from the fields, buried deep in his heart and unexpressed, a masculine acquaintance with natural law such as the gazing rhapsodist shall never possess. Perhaps, as a child of the city, I may be barred out from judging these high matters. Yet I too have had my share of Thorellian vagabondage—who has not in these days?—and have even relived in humbler fashion the experiment of Walden. I know how easy it is to wander by the river's brink, meditating on the eternities, or to discover gospels in the chalice of a flower. Doubtless these solitary communings with nature are a desirable antidote to the fever of the world; they have their incalculable reward, but their very facility is a warning not to trust them too far. For my part, I shall suspect always that, failing the initiation of plough and harrow, I have still come short of the greater mysteries. It is something to observe idly the miracles of spring, but I read the opening of the "Georgics" and know how far this is from the joy of feeling one's self a partner in the great task of renovation. It is something to watch with unconcern the tempestuous glory of the clouds, but again I remember the storm in Virgil and know how different are the emotions of one who spells his prosperity or ruin in the portents of the sky. Alas, *labor improbus!* it is not facile enthusiasm alone, but the curse-born sweat of the brow that shall at last bring a man into harmony with the stern realities of nature. And even where unremitting toil benumbs the fancy to the dulness of the day, there is left the wholesome instinct of the earth. Mr. Mitchell himself reduces this virtue to the lowest point:

> Rural life offers charming objects of study; but to most minds it does not offer the promptings for large intellectual exertion. It ripens healthfully all the receptive faculties; it disposes to that judicial calmness of mind which is essential to clearness and directness of vision; but it does not kindle the heat of large and ambitious endeavor. Hence we often find that a man who has passed the first half of his life in comparative isolation, cultivating his resources quietly, unmoved by the disturbances and the broils of civic life, will, on transfer to public scenes, and stirred by that emulation which comes of contact with the world, feel all his faculties lighted with a new glow, and accomplish results which are as much a wonder to himself as to others.

We go out, poor children of the city, to scamper up the mountain paths or loiter on the seashore, or mayhap, being country-bred, we make a profession of studying and discoursing nature. But never in this way, I believe, shall we possess the strength and silent instinct of the soil that are nurtured by working with the forces of earth and air, or the deeper yet still unuttered understanding that rewards such labor when crowned by observation and reading.

I do not know the full story of Mr. Mitchell's own life, or how far he has shared the common lot of evil and disappointment in his eighty-five years; I should not care to knock at the door of Edgewood and beg his acquaintance, for, gentle to all the rest of the world, he bristles with irascibility at the mere mention of editor or critic; but it is impossible to think of him otherwise than as rich in content, enjoying the harvest of a well-ploughed mind, sitting at this moment, it may be, amid his many books of husbandry, by the window that looks out over his farm, over the spires and belfries of New Haven, to the gleaming line of water and the lighthouse yonder upon the point. May we not once more, in taking leave of Mr. Mitchell, make use of the poet he has himself so often quoted, and liken his state to that of Virgil's old man of Tarentum who, in the possession of a few acres of exacting land, equalled in spirit the wealth of kings. P. E. M.

Correspondence.

THE HILPRECHT CASE AGAIN.

TO THE EDITOR OF THE NATION:

SIR: Your editorial of January 23, on the Hilprecht case, is much to the point, but, if you will permit me to say so, it is in one respect beside the point as far as the "signers" are concerned. As one of those who signed the memorial to Professor Hilprecht, and also as an officer of the American Oriental Society, I should like to emphasize the following facts before supplementing your editorial with a suggestion which would, if carried out, settle the whole "Hilprecht case" in a week. The first fact is that the American Oriental Society has taken no action whatever in regard to the controversy or investigation. Whatever has been said and written by members has been said or written by them as individuals, unofficially united in a group for the purpose of writing to Professor Hilprecht, but at no time as representatives speaking in the name of the society or of its directors. The second fact is, to the signers of the letter, also one of importance. You say in your editorial that "the report of the trustees exonerating Professor Hilprecht has generally been regarded as a mere piece of whitewashing." However the report may be regarded by others, the signers of the letter to Professor Hilprecht have no quarrel with the University of Pennsylvania, or any wish to imply that the trustees thereof did not do their moral duty as they saw it. They neither have made nor do make any charges against any member of the trustees or against the trustees as a body. Their matter is with Professor Hilprecht alone. From him they still desire satisfactory answers to their queries.

Professor Hilprecht now purposes to publish a volume upon the subject. But, as your editorial very truly says, "the easier and more direct way would be for Professor Hilprecht to prepare an explicit answer to the specific questions covering the main issues." You do not formulate the questions that have been asked; the public has doubtless forgotten them. But they are short and easy questions to answer, and it is to be feared that, in publishing a great mass of extraneous matter on the history of the case, Professor Hilprecht may lose sight of the main issues, and that the voluminous material may of itself blind the eyes of the public to the fact that all that is required of Professor Hilprecht is to answer to the best of his ability these short and easy questions:

(1.) Were the tablets, etc., found at Nippur?

(2.) Were they not purchased or found elsewhere, and at a time prior to 1900?

(3.) Were they not published by Professor Hilprecht as Nippur finds of 1900?

(4.) Were not the boxes of finds at Nippur boxed up prior to the arrival of Professor Hilprecht as director in 1900?

(5.) If boxed up prior to Professor Hilprecht's arrival, in March, 1900, why has Professor Hilprecht published accounts implying that he had previously seen them, and that he was present when they were found?

It is not a question of the *existence* of a library at Nippur. The question is only in regard to Professor Hilprecht's method in establishing such a library's existence, and in regard to his own part in the discovery. He has used as matter illustrative of the contents of the Nippur library certain tablets, *not one of which came from the site of the library.* What did Professor Hilprecht mean exactly, when he declared that he purchased at Nippur the "letter to Lushtamar," which was really purchased by some one else at Bagdad? Professor Hilprecht must see that he stands under a very dark cloud of suspicion, and that equivocation and evasion are not the means to lighten it. This is no local issue. There has been no combination of scholars to attack one of their number. The signers of the letter to Professor Hilprecht represent American scholarship. The scholars of both Europe and America would rejoice to have definite answers to the definite questions addressed to him; they do not want to believe that an able Oriental scholar has represented things which were found at one place as found at another; represented things as *found* at Nippur which had been *bought* years before. The publication of irrelevant matter in a stout volume will not do these scholars any good, nor will it do Professor Hilprecht any good. A brief specific reply to each of the specific questions asked would not take long to prepare. There is no need of many words. To the questions asked nearly two years ago no reply satisfactory to any Oriental scholar has ever been given.

E. WASHBURN HOPKINS.

Yale University, February 1.

THE WORD "BENDS."

TO THE EDITOR OF THE NATION:

SIR: I think I can answer the inquiry of your correspondent in your issue of January 30, regarding the origin of the word "bends," as applied to caisson disease.

In 1869-72 the three piers of the famous Eads (now called St. Louis) bridge were sunk. Though not the first, they were at that time the deepest sunk on the pneumatic principle, and the caisson disease was then first closely observed and intelligently treated. The physiological effects of the air pressure in the caisson manifested themselves only when the men reached the open air. I was then the general manager of the bridge company, and had ample opportunity to notice the men so affected. As they came up they would, with a suffering expression in their faces, hold their hands against their stomach, bend over, and, in a curved attitude, walk slowly and painfully to shore.

At that period there was a fashion among the women to walk with a bend, heads and shoulders thrown forward, and to emphasize this attitude by a tightening of the skirts across the knees and by wearing a wire cushion, stuffed and covered with various materials, called a "bustle." This fashion of walking was derisively called the "Grecian Bend." Our workmen, those who were well, when they saw one of their comrades coming up with the described symptoms of caisson disease, would laughingly exclaim: "He has got the Grecian Bend!" and, for years, so long as the sinking of the piers lasted, the disease retained its popular designation as "Grecian Bend." As these expert workmen migrated and went to other bridges, tunnels, and submarine work, they carried that name along with them, only, in the course of time, dropping the "Grecian" and retaining only the "bend." Prof. C. M. Woodward. the engineer historian of the Eads bridge speaks, in the caisson chapters, of this disease, its origin, and treatment, as "commonly called the Grecian Bend."

St. Louis, February 1.

"PIERCE PENNILESS."

TO THE EDITOR OF THE NATION:

SIR: An English proverb, one of many in John Lydgate's "Order of Fools," furnishes a possible clue to the name of Pierce Penniless in Thomas Nash's satire (1592), entitled, "Pierce Penniless, His Supplication to the Divell" (printed by Collier, Grosart, and in the recent Oxford edition 1902-5). The proverb runs (line 104):

> Purs penylees in plees may never thee.

The "purse penniless" of the proverb may have become "Pierce Penniless," on the analogy of "Piers Plowman." It should be remembered that the old pronunciation of *Pierce* is identical with *purse*, as is shown in the New England family name, still pronounced like *purse.*

Oxford, January 28.

"PRACTICAL" STUDIES FOR WOMEN.

TO THE EDITOR OF THE NATION:

SIR: May I revert once more to the question of women's education, in order to illustrate the utterance of a sage by the remark of a babe and suckling?

At a recent convention in Boston, President Eliot, while courteously admitting that women faint no more than men in pursuing the same college studies, prophesied that in the future they are rather to direct their attention to courses which will enable them properly to nurture and to admonish children, either their own or those of other people.

I have recently been making a visit in a small town in Maine. There I met a woman whose father was a day laborer, whose husband is a carpenter, and who has four very young children. She belongs to a club, which studies with genuine diligence, and at present is devoting two winters to French history. I said to her that I thought it was wonderful that, with her family of babies, she could find time to write papers and to read so many books. Her surprised answer put me to shame: "But it is just because of my children that I must read. I am determined that they shall not have to look for such pleasures outside of their home as I have had to."

In this country most fathers are forced by their occupations to spend the greater part of each day away from their homes, leaving to mothers the more intimate companionship with their children. The results of such companionship must be mental as well as physical, if the American home is to become the cradle of American citizenship. Precisely because many of us agree with President Eliot that to women chiefly is entrusted the care of the rising generation, we should deplore the entrance into their colleges of child study, and dietary courses, to the exclusion of Greek and astronomy, of history and literature. Man does not live by bread and milk alone.

ANNE C. E. ALLINSON.

Providence, R. I., January 3.

COLLEGE MEN IN ELEMENTARY SCHOOLS.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "Elres," in the *Nation* of January 9, has set forth among other things the usual doctrine concerning the preparation of teachers for the public schools. It is quite true, as he says, that in the elementary school the child recites in all subjects to one teacher, usually a woman, and that the youth in the high school recites in each subject to a different teacher, who is a college graduate and, more and more commonly, a man. At least this is the goal toward which the better public schools seem to have been for a long time striving.

Now it seems to me extremely important that this doctrine that only college graduates should be permitted to give instruction in the last four grades of a public school while anybody may teach in the eight grades below should never be urged in such fashion as to make a college man consider himself out of place in elementary work if he feels a call to it and the community is willing to retain such superior service. Formerly many college-bred men (always meaning men and women) were found in the rural and elementary schools, from which they are deplorably absent now. In my youth I attended a district school in which, in addition to the "three R's," geometry and Latin were taught, and usually by a college graduate. In a neighboring city there were at that time more teachers of college training in the elementary schools than there are today, although population and wealth have increased nearly eight-fold. I refer distinctly to teaching and not to school administration.

The late lamented Prof. William Harold Payne, in his "Contributions to Education" (Harpers, 1886), was one of the earlier writers in this country to urge a specialization of function among public school teachers. His discussion of this question had a curious practical result in the West, not, I am sure, anticipated or desired by him. It had, of course, little effect upon the high school corps, which had always, and properly, been recruited from the colleges, but it made college men feel out of place in the rural or the elementary schools where they had previously been found in considerable numbers. I kept for a time a large bundle of letters from college-bred people who were bewildered and offended by this attitude toward elementary instruction which they had previously thought honorable and had found remunerative and congenial. Abundant statistics go to show that about this time college men began to withdraw from this field, with a consequent relative decline in the consideration and salary accorded to elementary teaching. It is true that the case would be greatly improved if, with "Elres," we could divide the twelve grades of a public school into two departments instead of the three at present generally recognized.

We need college men in the high school not so much on account of their superior information, though this is important, as for their broader views, higher ideals, and finer temper. And the lower schools need the same kind of men—at least enough to set the pace—for the same reason. Our elementary schools have many excellences, but are wanting in tone. The teachers are devoted but often need the authority and social acceptance, such as a residence at college would give. Even if we take up that great unsolved problem of the public school as a preparatory school we but emphasize the same view. For it is the public school as a whole and not the high school alone which prepares for college. The main objections made against the public school as a preparatory school have reference to the elementary work. Mention is made of poor English, low ideals, bad habits of study, and general slovenliness of work which are intolerable to an educated man and which only educated men can drive out. A concerted effort to improve the tone of all grades of our public schools is in order if they are to hold their place as preparatory schools.

E. A. STRONG.

Ypsilanti, Mich., January 28.

Notes.

Little, Brown & Co. announce for this spring the second and concluding volume of "The Victorian Chancellors," by J. B. Atlay. From the same house will come "In Greece with the Classics," by W. A. Gardner.

"A Good Shepherd and Other Sermons," by the Rev. W. R. Huntington, D.D., rector of Grace Church, New York, is to be reissued by Thomas Whittaker in a cheap and popular form.

The official life of the seventh Duke of Rutland, the Lord John Manners of political annals, is to be written by Charles Whibley. This promises to be a work of considerable interest, as Mr. Whibley writes with a light hand. Another biography under way is of Alexander Pope by Miss E. M. Symonds ("George Paston"), whose last work was a life of Lady Mary Wortley Montagu. Both writers ask permission to copy any unpublished documents pertaining to their themes.

M. Sturge Henderson's study of "George Meredith: Novelist, Poet, Reformer" (Scribner's) offers further evidence of what every reader with his nose to the wind must have felt for some time, that Meredith is rapidly displacing Browning as the advanced prophet of literature. And the large amount of space given by Mr. Henderson to Meredith's poetry adds cogency to such an estimation of the running of the two *vates*. "Meredith, however," says our critic, "twenty, thirty, and forty years ago, sought to give poetical expression to ideas which are only now dawning upon the general consciousness, and which will only be common property twenty, thirty, forty years to come." Such a statement, one must admit, is a little discomfiting to meet in a book of criticism. It raises expectations of some recondite philosophy which, when mastered, will throw a burst of light on the dark tangle of human fate. Naturally disappointment ensues when this esoteric doctrine is found to be only our old friend—or perhaps in things spiritual, enemy—evolution. Earth, in Meredith's scheme, is a mystic symbol for the union of man and nature, man rising by grades of progress from his animal instincts to the dominion of mind, yet, on peril of losing health and strength, carrying with him the source from which he springs. It should really seem to need no Daniel to unravel such a metaphysic. Yet the insistence on this philosophy tends, against the desire of the critic, to exaggerate the weak side of Meredith—and of Browning—as a writer. His novels, and to an even greater degree his poems, lose in artistic effect because their intellectual intention, whether profound or superficial, predominates over instinctive perception and imagination. To dwell overmuch on this aspect of his work is thus to lead the reader to ask why he should have chosen the forms of art for his medium. For those, however, who feel no inhibition to their spontaneous pleasure in such an analysis, Mr. Henderson's study may be heartily recommended. It is thoroughly informed and cleverly executed. Nor with all his admiration does he fail to observe and note the deficiencies in Meredith as an artist. Thus, he concludes:

> It argues no lack of appreciation of this rich intellectual endowment to say that, when Meredith's achievement is estimated as a whole, it occupies a secondary place. His inspiration appears to lie in his poetic grasp, the intensity of realization with which he holds to the main issue and keeps it living, in defiance of the tangles of complexity he is for ever weaving every side of it, and which might have been expected to prove fatal to the life within.

Two doctoral theses of the English department of Columbia University (published by The Macmillan Co.) deserve notice both for the value of the material brought together and, to a certain extent, for their qualities of judgment. One is a study of "Sir Walter Scott as a Critic of Literature," by Margaret Ball, a thorough examination of that writer's work from a point of view commonly neglected. Her chapter showing the position of Scott midway between the school of Jeffrey and Gifford and that of the new romanticists is judicious, if not very illuminating. The other study, by Lillie Deming Loshe, turns to "The Early American Novel," and discusses the fiction produced in this country from 1789 (the date of Sarah Wentworth Morton's "Power of Sympathy") to 1830, when Cooper was in full swing. Apart from Cooper the most notable figure in this period is Charles Brockden Brown, whose novels are here analyzed and appraised with candor and discrimination.

Kent, as one of the ancient gateways into England, is sufficiently rich in historic associations, but there needs only a glance through Walter Jerrold's "Highways and Byways in Kent" (The Macmillan Co.), with its names of famous authors on every page and its innumerable verse quotations, to see how the literary interest dominates over everything in this respect. No county of England is richer. At the very beginning is the Canterbury of Chaucer and Dickens. Allington Castle is famous for the Wyatts, one of whom, Sir Thomas, introduced the Italian manner into England, and is thus the father of the English literature which we are reading to-day. Gadshill brings up Shakespeare and Dickens; Penshurst still preserves the glorious memories of the Sidneys; Boughton Malherbe was the birthplace and always the spot beloved of that diplomat and scholar, Sir Henry Wotton; Deal was the home of Elizabeth Carter; Tunbridge Wells introduces us to half the society and wit of the eighteenth century; Tappington is the country of the "Ingoldsby Legends"—such names might be multiplied indefinitely. Nor are quaint traditions of the soil and the pageantry of kings and tragic queens lacking to fill out the picture. All this Mr. Jerrold has treated with the fulness and fine reminiscent flavor that have made the Highways and Byways series unique among books of travel and description. The illustrations, from drawings by Hugh Thomson, if they have not the topographical exactness of the usual photographic reproductions, possess in themselves a value for the eye, and fit in as a real part of the text. We have praised volumes of this series before, and take pleasure in announcing each new one that appears.

There is large diversity of interest in Scotland's western river as it wanders a clear stream among the hills, flows by the polluted banks of Glasgow, and broadens into the firth. Of this diversity Neil Munro has taken advantage in writing "The Clyde" (The Macmillan Co.), to make a book in which descriptions of nature, reminiscences of old castles, and glimpses of modern industry follow in quick succession. The colored illustrations are from paintings by Mary Y. and J. Young Hunter. They are of the character to which we have become so well accustomed in these picture books—at times clear and almost beautiful, at times a mere daub of crude colors.

The series of Calendars of the Letter Books of the City of London, which Dr. Reginald R. Sharpe has been editing since 1885, has recently been increased by the publication of a new volume, "Letter Book H, Temp. Richard II." The original volumes, thus in process of calendaring, are preserved to-day in the records department of the Town Clerk's Office in the Guildhall, and consist of more than fifty manuscript letter books, A to ZZ, 1275-1688.

Their chief value rests on the fact that they begin about 140 years before the Journals of the Common Council and about 220 years before the Repertories of the Court of Aldermen, and contain almost the only remaining records of these courts prior to the commencement of such journals and repertories. They are written on vellum in Latin, Norman-French, and English, and consist of entries of a miscellaneous character, chiefly relating to the City and companies. Extracts from the first nine letter books were published in 1868 by Riley in his "Memorials of London and London Life in the Thirteenth, Fourteenth, and Fifteenth Centuries," a publication of value, but manifestly incomplete. The present series is definitive in that it calendars all the entries without omission. We understand, however, that it is to be discontinued as soon as the period of the Journals and Repertories is reached. The volumes as a whole relate chiefly to the history of the City of London in the Middle Ages, but at times throw light on the history of the kingdom. Letter Book H covers a period of twenty-four years, 1375 to 1399, and furnishes important evidence for the policy of London during the reign of Richard II. and the struggle of the factions supporting Richard and John of Gaunt respectively. In fact, the volume becomes almost an indispensable aid to an understanding of certain phases of the history of the Good Parliament, the condemnation of Lyons and other aldermen, the rise of Nicholas Brembre, and the movement which cost Richard the support of the City. On the other hand, it is provokingly silent on many important matters that should have found mention in the original texts. Such omissions are manifestly due to intention as well as to silence, for in these volumes are traces of mutilation which are clearly the work of hostile factions. Blank leaves seem to indicate also that further entries were planned, but never made. Dr. Sharpe's introduction, which deals solely with the contents of this volume, is a notable contribution to the history of Richard's reign.

The "History of the Society of Jesus in North America, Colonial and Federal," by Thomas Hughes (Cleveland: Burrows Bros.), forms a section of the great series undertaken by Catholic authority and having for its object a complete history of early Jesuit activity throughout the world. This will account for the fact that Father Hughes's volumes, of which two have appeared, are more limited in scope than the title would indicate. For they are confined to English-speaking North America, excluding the Spanish and French Jesuits, and including Canada only since the English occupation. Thus narrowed in compass, the story of the first volume concerns only Maryland, and is related only to the year 1645. In the second volume are "Documents," from 1605 to 1838, applying to the early history of the missions and to the Jesuit property and its uses in the Maryland and Pennsylvania missions. The materials are drawn almost wholly from Jesuit sources, and the author confesses that a history of the English Jesuit province should first have been published, to which these volumes would have made a fitting continuation. Technically, the most interesting chapters are those which are based on the Jesuit archives, hitherto so little known or used. These archives are imperfect; for the policy of silence adopted by the society has prevented publication, and the persecutions endured have involved extensive losses. It must be admitted that the author has added comparatively little to what was already known of the first years of Maryland's settlement; and the many controversies involved in the purpose and methods of that venture have frequently led him off the main track. Hume, Paley, Blackstone, and Hallam he criticises with some show of feeling, and a few modern writers on Maryland he severely condemns. In a history intended to be "authentic" such animadversions are misplaced. To Cecil Baltimore no commendation is given. He invited the priests to go to the settlement, but made no provision for them; he compelled the Indians, for whom he did nothing, to contribute to his chapel; and he was tricky in his treatment of the fathers and the church property—an "intense feudalist for his own benefit." The charter and acts of the first assemblies are examined minutely to show how hostile Baltimore and his secretary, Lewger, were to the Jesuit interests. The charge that negro slavery was first introduced into Maryland by the Jesuits is stoutly combated.

From E. P. Dutton & Co. we have Robinson Smith's "English Quotations," arranged by authors chronologically. It is mostly verse, only a few prose quotations being included from Bacon, Carlyle, and one or two others. Nor is it quite in the style of the ordinary quotation book, being rather a collection of "elegant extracts." The poetical value of a passage has more weight with the editor than proverbial portability. As such the pages of the volume may be turned over with unflagging interest.

The latest edition of Burke's "Peerage, Baronetcy, and Knightage"—published by Harrison & Sons, London, and distributed here by G. P. Putnam's Sons—is a volume of bulk and weight duly suggestive of the vast accumulation of more or less solid honors, of which it furnishes, on the whole, the most authentic record. With its various prefaces, all packed with information useful to the student of artificial social gradations, it contains more than 2,800 pages, filled with double columns of small and close type. Therein may be found the fullest particulars of the family and standing of every British subject distinguished from his fellows by any sort of title, prefix, or addition. Inasmuch as all the pedigrees printed have been compared with all available public and private records, and have been submitted to the persons most concerned, there is no reason to doubt their substantial accuracy. "The Peerage," indeed, of Sir Bernard Burke has been accepted for many years as a final authority on such matters, and is invaluable, of course, not only to the mere worshippers of rank and fashion, but often to the historical student. It is a monument of patient research and skilful arrangement, as well as of human vanity.

It is a pity that Horace Bleackley, in writing his "Story of a Beautiful Duchess" (E. P. Dutton & Co.) did not display as much taste as industry. Nothing is more extraordinary in the anecdotal history of the eighteenth century than the sudden burst upon English society of the two beautiful Gunnings, Irish girls of no particular extraction, of whom one, the sprightly and capricious Maria, became Countess of Coventry, and the other, the stately and pensive Elizabeth, became successively Duchess of Hamilton and of Argyle, and just missed by the turn of a lawsuit being the mother of a Duke of Douglas as well. Mr. Bleackley has undertaken to follow Elizabeth through her whole career, and to this end he has caught all the epistolary gossip of the age in his net. And he has gone further than that: in examining the files of the newspapers which lived on the dissemination of scandal, he has opened a practically unexplored field for this kind of biography so much affected at present. Some of the information thus obtained may seem too trivial for repetition, yet, granting the *genre*, one cannot well blame the writer for carrying out its motive to the logical end. If we are to have a description of the masquerade given at the Pantheon, February 18, 1773, and of the meeting there of the Duchess's daughter and the "squat round-faced Lord Stanley" (whence an Iliad of woes), it is well to have that description fortified by details from the *Town and Country Magazine* of the day. And again if we are to read about the rupture that broke the marriage of that ill-assorted couple, we may as well have the scandalous rumors spread by the *Morning Post*, the *Rambler's Magazine*, and the *Town and Country*. At least these details make the society of the day a living, if not always a decorous, reality. Our quarrel is rather with Mr. Bleackley's literary art. He can never mention one of the Gunnings but she is "lovely," "fair," or "beautiful"; his own comments on the life of the times are too often flat and sentimental; he is capable of "sinking" in bathos so far as to say: "The shining cloudland, wreathed by fable around the creatures of the past, invests them with an immortality which the charm of mystery must always allow." It is a pity, we repeat, that honest industry should be marred by such ill taste. So many anecdotal memoirs of the eighteenth century are turned out these days upon the most superficial preparation that we should be glad to commend more heartily a book that is at least thoroughly documented, and, in its substance, not without human value.

"The Life of George Matheson, D.D.," by D. Macmillan (New York: A. C. Armstrong & Son), is a most stimulating book. While it is full of lessons for every one, it appeals especially to the young men or women who, laboring under some great physical infirmity, feel that for them an actively useful life is an impossibility. It is the story of a Scotchman who became practically blind at eighteen, yet when he died in 1906, at the age of sixty-four, was the most distinguished man in the Scotch pulpit, and had received the highest academic honors his countrymen could confer on him. For thirty-one years, thirteen of them in one of the largest parishes in Edinburgh, he discharged all the duties of a minister, pulpit and pastoral. He also wrote twenty-two books on devotional, theological, and philosophical subjects, besides being a constant contributor to the magazines. His published works have had a world-wide circulation, one of them, "The Spiritual Development of St. Paul," having been translated into Chinese. To his brilliant qualities as a preacher and writer he added those of a poet. In almost every hymnal in the English language is to be found the hymn which he said "came to me spontaneously, without conscious effort," after most severe mental suffering, "O Love, that wilt not let me go." His biographer gives a charming picture of the man who bore his burden lightly, gallantly, to the end; a man whose life is perhaps best described in his own words when taking leave of his congregation:

> I think that next to the strength of God, and next again to your kind coöperation, I was indebted to my own weakness. . . . My life has been level with your own—an obstructed life, a circumscribed life, but a life of boundless sanguineness, a life of quenchless hopefulness, a life which has beat persistently against the cage of circumstance.

Treatises on homiletics are often of no great depth or value, but an exception must be made in favor of "The Pastoral Teaching of St. Paul: His Ministerial Ideas," by the Rev. W. Edward Chadwick, an Anglican clergyman of Northampton, England, (imported by Charles Scribner's Sons). The principles, methods, and spirit of the evangelizating endeavors of the great Apostle are submitted to careful examination with a view to securing counsel for ministerial activity in the present day. The temptation in this sort of essay is to let one's feeling for present needs dominate his research into the work of the exemplar, but Dr. Chadwick has evidently studied Paul first, and subsequently applied conscientiously to present needs the principles discovered. The treatise is none the less practical because it is in the first instance a careful piece of Christian biography.

Students of the New Testament will remember a treatise of singular fascination and ability entitled "Silanus the Christian," by Edwin A. Abbott, in which imaginary characters of the second century discuss the problems presented by early Christian life and literature. A sequel to that volume now appears, "Apologia: an Explanation and Defence" (The Macmillan Co.), in which Dr. Abbott replies to his critics, both friendly and hostile, and endeavors to clear away misunderstandings which have arisen in regard to his position. His answers are straightforward and plain, but doubtless many will still be unable to comprehend how he can retain his faith in "the eternal unity of the Father, the Son, and the Holy Spirit, and in the supernatural but non-miraculous incarnation of Jesus as the Son of God," while refusing credence in the miraculous element of the Bible. Further volumes, "Notes on New Testament Criticism" and "Indices to Diatessarica," are promised for the near future.

In February, 1906, at the close of the third Babylonian expedition of the University of Pennsylvania, Dr. John Henry Haynes dug up at Nippur, within the temple area on the northwest side of the *ziggurat*, or step pyramid of the temple, a fine *kudurru*, or boundary stone, of Nebuchadnezzar I., dating from about the middle of the twelfth century B. C., and recording a grant of land to a certain priest connected with the worship of the god Nusku. This stone appears not to have been set originally upon the land granted, as was the ordinary use, but to have been deposited in the temple at Nippur, where the grantee was a high official. In addition to the ordinary contents of a *kudurru* stone—namely, the divine symbols, an account of the circumstances under which the land was granted, a description of the land, a warning against appropriation of the land by any other than the owner, or any interference with the privileges of the owner, an invocation of the gods to mete out punishment to offenders against the warning, curses upon any one removing or destroying the stone itself, and the names of witnesses and date of grant—this stone has two interesting and peculiar features: a map of the land granted and a hymn to Ellil, the Bel, or chief god of Nippur, presumably taken from the liturgical collections of hymns in use at the Nippur temple. This stone has been published by the Rev. Dr. William J. Hinke, assistant professor in Auburn Theological Seminary, and made by him the basis of a discussion of Babylonian boundary stones in general, in Vol. IV., Series D, of the Publications of the Babylonian Expedition of the University of Pennsylvania, under the title "A New Boundary Stone of Nebuchadnezzar I. from Nippur." It is the fullest discussion up to date of this peculiar class of monument, which seems to have originated with the Cassite dynasty of Babylonia, and to have been almost confined to the Cassite period. The volume contains fifty-one illustrations of boundary stones, the symbols on those stones, inscriptions, and the like. Somewhat more than one-third of the entire volume is devoted to a concordance of names, persons, places, rivers, deities, and symbols contained in the boundary stones heretofore published, and a glossary of the *kudurru* inscriptions in general.

Only ten years have elapsed since Prof. Morris Jastrow of the University of Pennsylvania published his "Religion of Babylonia and Assyria," but in the interval so much has been added to our knowledge in this field that the author already regards his work as antiquated. Accordingly, when a German publisher proposed a translation, Professor Jastrow found himself obliged to rewrite the book, with the exception of the introductory chapters. The German version, "Die Religion Babyloniens und Assyriens" (Giessen: Alfred Töpelmann), has in the process of revision been much enlarged, principally by more specimens of the religious literature, especially the prayers, lamentations, oracles, hymns, and magical formulæ. The original English work was contained in a single thick volume, of almost 800 pages. The German translation is to consist of three volumes, of which the first, 552 pages (the work has been published in parts), was completed more than a year ago, while of the second volume considerably more than half is in the hands of subscribers. In Part xi., just delivered, the author describes his aim to be not to give a history of the Babylonian-Assyrian religion, but "a picture of our present knowledge of that religion." This part continues the treatment of oracles and omens, begun in Part x. These were matters of prime importance in the religious practice of both Babylonians and Assyrians, and the larger part of the library of Ashurbanipal, which is still our chief and almost only source of information, deals with those themes. Many of these texts have been published, but comparatively little has heretofore been done in interpretation. Professor Jastrow, who has subjected them to a new and more thorough study, believes that he has found the key to at least one important subdivision, in the fact that in the inspection of the sacrificial victim to prognosticate the future, only the liver was examined, because this organ was regarded as the seat of life and of the soul. The next two parts, which are to complete the second volume, will deal with the other branches of the omen literature—observations of the heavens, cup magic, treatment of the sick, dreams, and forecasts of the future based on various events and phenomena. A third, supplemental volume, dealing with the mythology, the temples, and the ritual, covering the same field as the last seven chapters of Professor Jastrow's original work, will be published later as one whole, and not in separate parts.

J. C. B. Mohr of Tübingen announces as immediately forthcoming from the pen of Prof. Adolf Deissmann of the University of Heidelberg, but now called to Berlin, "Das Neue Testament und die neuentdeckten Texte der griechisch-römischen Welt."

The series of conservative discussions of Biblical and religious problems known as Beiträge zur Förderung christlicher Theologie, edited by Prof. A. Schlatter of Tübingen and Prof. W. Lütgert of Halle, appears in its volume for 1907 in four parts, each of which is sold separately. The most noteworthy features are the late Prof. Fr. Blass's examination of the recent works of Prof. A. Harnack on the Lukean writings and Professor Schlatter's examination of modern doubts on the Messianic character of Jesus. The series is published by C. Bertelsmann, Gütersloh.

An appeal has been published, signed by Pastor Gustav Tschirn of Breslau, chairman of the Association of Liberal Churches in Germany, as also of the Free Thinkers' Union, by Dr. Heinrich Schmidt of Jena, the general secretary of the Monistenbund, and by Dr. Rudolf Penzig of Charlottenburg, the general secretary of the German Society for Ethical Culture, calling a convention of representatives of all organizations advocating radical religious thought, to meet in Weimar for the purpose of effecting a *Zusammenschluss der freien Geister*. The purpose is advocacy of advanced religious thought.

"Menschen, die den Pfad verloren" is the title of a contribution to modern social problems (Stuttgart: Max Kliemann). It is the report of Sister Henriette Arendt on her work among the fallen women of Stuttgart, where she has been coöperating with the authorities as the first woman police assistant in Germany. The report covers five years, and is accompanied by proposals of reform that have grown out of actual experience. The introduction is written by Pastor Friedrich Naumann.

"Per Aspera ad Astra: Lebenskampf" is the title of a new and readable importation of G. E. Stechert & Company. As the subtitle, "Schicksale eines ehemaligen Offiziers in America," indicates, it presents the experience of a German gentleman, formerly an officer in the Prussian army, who came to America in 1893 to seek his fortune, and who was scarcely able, for a long time, to keep body and soul together. The narrative is given in letters to near relatives, dated chiefly from Milwaukee, Cleveland, and Harrisburg, in each of which places the writer contested for existence, suffering intensely from hunger and cold; slaving as iron-moulder, coachman, picture-vender, life insurance agent, and farina packer; and slowly making his way up to be an associate-editor (of an anti-Kaiser Socialist sheet), *Herr Professor* in a language school, and finally instructor of German in a young ladies' seminary. The volume is attractive for its evident truthfulness and the moderate and friendly tone in which the author discusses American institutions and contemporary events. Not that the *Auswanderer* lost his affection for the associations of home and the Fatherland: his letters are full of longing for friends and scenes left behind, of intelligent interest in social and political movements in Germany. Every such book is sure of a wide welcome, particularly in America, for its story is but the echo of an Odyssey familiar to thousands of immigrants who have become desirable citizens.

It was well known to the friends of Berthold Auerbach that this popular poet and novelist intended to write his autobiography; and after his death there were found among his papers many miscellaneous notes containing recollections of his grandparents and records of his early childhood, none of which, however, were in a form suitable for publication. Even if the material had been put into proper shape, so as to furnish a consecutive narrative, the result would have given no information concerning that portion of his life and career in which the public were chiefly interested. The disappointment then so keenly felt will now be somewhat alleviated by the appearance of Anton Bettelheim's "Berthold Auerbach," just published by Cotta, Stuttgart. The author is an Austrian favorably known for his biographical sketches of his contemporaries, Ludwig Anzengruber and Marie von Ebner-Eschenbach. In his critical survey of Auerbach's literary activity and productivity he shows a fine appreciation of the eight volumes of "Schwarzwälder Dorfgeschichten," in which the peasants of the German Black Forest are described. The biography presents a remarkable fulness of detail without lapsing into undue diffuseness; and Bettelheim's strong admiration does not prevent him from being impartial in expressing what he deems Auerbach's weak points both as a man and as a writer.

Statistics compiled by the State Education Department, show that of villages in this State having from 1,000 to 2,000 population, forty-three maintain free libraries. The total population of these villages is 62,169, their total stock of books 150,432 volumes, their circulation 350,852 volumes. The annual cost of maintenance is $23,130, of which only $7,710 is received from local taxation, the balance from invested funds, State grants, or proceeds from entertainments, private gifts, or membership fees. A comparison of the showing made by the whole group with that of city libraries ministering to equal populations, indicates that, in spite of scanty support and insignificant salaries these village libraries are far in the lead of those operating in cities, both in their per capita supply of books and in the number of volumes issued. Thus, the population of the group is almost exactly that of Utica. For building, equipment, quality of staff, and public support the Utica Public Library is among the first of its class in the United States; yet these village libraries, with only a quarter as much tax support, and no trained librarians, have accumulated a stock of books three times as large as that of Utica and issue about two and a half times as many books a year.

In April last Henry Sotheran & Co., the London booksellers, issued a catalogue of an important collection of English literature, but the name of the former owner was not made public. The list included a set of the four folios of Shakespeare (priced at £7,000), several quartos, and other important items. Many of these books are now turning up for sale at auction at Sotheby's, March 20 and 21, as the library of the late Rt. Rev. John Gott, sold by order of the executors. Only one of the Shakespeare quartos ("The Merchant of Venice," Roberts, 1600) is in the sale catalogue, but the four folios will be offered. The first is a perfect copy, but small (12½ by 7⅞ inches), the leaf of verses preceding the title page is extended on the inner margin, the last leaf is remargined with four letters in facsimile, and a few other leaves are mended. The third folio is the 1663 issue, without the portrait on title, and without the seven spurious plays at the end. The second and fourth folios are good copies with the common imprints. Among other notable volumes are Painter's "Palace of Pleasure," 1566-67, large paper, described as unique; Spenser's "Faerie Queene," 1590-96, earliest issue of the first edition; Spenser's "Complaints," 1591, large paper, and his "Colin Clouts Come Home Againe," 1595; "Paradise Lost," both issues of 1667; Halle's "Chronicles," first edition, 1548; the Coverdale Bible, 1535 (the first Bible in English); two editions of the "Great" Bible, 1539 and 1541; a long series of editions of the Book of Common Prayer; Hakluyt's "Divers Voyages," 1582 (lacking the maps); and Caxton's first edition of "The Golden Legend."

Dr. Albert Harrison Mixer, professor emeritus of modern languages at the University of Rochester, died at his home last Friday at the age of eighty-five. He was a member of the original faculty of the university in 1850, and taught there forty-two years. He was the author of a "Manual of French Poetry" and a "Manual of French Pronunciation."

The death is announced from Weimar of Julius von Eckardt at the age of seventy-one. Dr. Eckardt, a Livonian by birth, came to Germany in 1867 as an assistant of Freytag in editing the *Grenzboten*. In 1882 he entered the state service of Prussia under Bismarck, and was consul at Tunis, Marseilles, Stockholm, and elsewhere. He was the author of several works on Russia and Livonia, and he is supposed to have written "Berlin-Wien-Rom," 1892, which caused something of a sensation.

Dr. Heinrich Hübschmann, professor of comparative philology at the University of Strasburg, has died at the age of fifty-nine. His works include "Die Umschreibung der Iranischen Sprachen und der Armenischen," "Das indogermanische Vokalsystem," and other studies of the kind.

Auguste Lepage, historian and journalist, has died at the age of seventy-two. Among his works are "Histoire de la Commune," Recits sur l'histoire d'Alsace et de Lorraine," and "Les Sièges héroiques."

STUDIES IN BIOGRAPHY.

A Life of Gilbert Burnet, Bishop of Salisbury. By T. E. S. Clarke and H. C. Foxcroft. With an Introduction by C. H. Firth. New York: G. P. Putnam's Sons.

A recent life of peace-ingeminating Falkland called attention to the fate of a moderate caught between the furious extremes of royalists and parliamentarians in the civil war; the present volume is the study of one who in like manner attempted to steer between the party passions of Tory and Whig in the succeeding period. We may say, "in like manner," though nothing could be more diverse than the temper of the two men and the results of their "trimming." Falkland, sensitive in nature, loving peace and the quiet fruits of study, leaning, when forced to take part, toward the weaker side, ending his life despairingly at Newbury, has been lifted up as a martyr to reasonableness by such writers as Matthew Arnold and his late biographer; whereas Burnet, boisterously active yet with strange passing whims for ascetic seclusion, the most impudent of men, yet struck at times by moods of self-debasing modesty, a non-partisan in theory, yet ending as a violent Whig, a believer in celibacy, yet thrice married (always to an heiress), has passed into history as the buffoon of the Revolution. It is the contrast of tragedy and comedy. Taking as subject a fire that occurred in Burnet's study in 1713, Parnell hit off his character in a couplet:

> Then roars the prophet of the Northern Nation,
> Scorched by a flaming speech on moderation.

Burnet, through his histories and other innumerable writings, is one of the best-known men of his age, but the very bulk of the material, and his impulsive self-contradictions make such a biography as the present difficult and desirable. It may be said that the joint authors have accomplished their task admirably; they have produced a book that is at once documented at every step, and thoroughly interesting. They have both faced the weaknesses of Burnet's character without flinching, yet have avoided party prejudice. Mr. Clarke is the minister of Saltoun, where Burnet officiated as a young man from 1665 to 1669; he has written the life down to Burnet's appointment in London in 1674. If any comparison is to be made, this first section is the more entertaining of the two. With marked skill Mr. Clarke has set forth the disturbed state of the Scotch church in those days; the divers family influences that moulded Burnet's character, thrown between a father of pacific temper and episcopal leanings, and a mother who belonged to the uncompromising Presbyterian Johnstons of Annandale; the education and travels of the son Gilbert during the troubled years before and just after the restoration; his activity at Saltoun, and his still more prodigious activity for four and a half years as professor of theology at Glasgow.

The larger part of his life, including his ministry in London, his episcopacy at Salisbury, and political career fall to Miss Foxcroft, who is particularly qualified for the task. Her biography of the first Marquis of Halifax, while somewhat heavy-paced, showed how judiciously she could follow the path of a "trimmer" through the labyrinth of restoration and revolution politics; her edition of "A Supplement to Burnet's History of His Own Times" still further prepared her for this other "trimmer" of the age. Like her "Halifax," the present work moves at times, especially toward the close, a little slowly, and lacks, when the author departs from quotation, the faculty of nimble, telling portraiture. It is deficient on the human side, and one is surprised, for example, that not a word is said of Burnet's friendship for Lady Mary Wortley, who made her translation of Epictetus under the guidance of the great Whig bishop. Other touches of this kind are omitted which might lighten Miss Foxcroft's chapters. On the other hand, her political sense is almost unerring, and her characterization, while never brilliant, is remarkably clear and just. It is not a little thing for an Englishman or woman to deal thus impartially with these fountainheads of English politics.

And if she makes no pretensions to the brilliance of Macaulay or Lecky, she at least offers all the materials for the portrait of one of the oddest and most interesting characters in English history. The mainsprings of that character are open to view—an invincible egotism and a no less invincible vitality, which together made the impression of himself upon others a peremptory need of his nature. Never lived a man who gave more advice. He could not meet king, priest, or peasant, but forthwith he began to admonish. When the meetings with Charles II. in the backstair apartments of Chiffinch—sandwiched between less reputable assignations, we fear—were not sufficient, he sent a letter to that long-suffering monarch, warning him that only a change of his own heart and of his course of life could avert impending troubles. King Charles, it is said, read the letter twice, and then, without a word, threw it into the fire. William suffered no less than Charles; Mary endured his interminable lectures even graciously, but the young Duke of Gloucester, who was delivered over to the prelate for instruction, was talked and lessoned into an early grave. When in Paris Burnet was summoned by the unsuspecting *grand monarque* to Versailles, where, says a horrified Frenchman, although he "spoke the French tongue very ill . . . his confidence and assurance bore him fully out, and he talked for ever and as much before the king as in his own room." The distressed courtier remonstrated; but "Burnet did not amend, and the king bore all." One can forgive him all for his blundering *bon mot* to the Duchess of Marlborough, who was asking him the reason of Belisarius's—and by implication her husband's—disgrace. Madame, replied the innocent bishop, he had "a brimstone of a wife."

In the pulpit his egotism and activity, with the resulting proneness for admonishing, had full swing, and as a preacher Burnet was a real power. How carefully he prepared for this office he has himself told —as he has told everything else:

> I read the Scripture with great application to get a great deal of it by heart, and accustomed myself as I was riding or walking to repeat parcels of it. I went through the Bible to consider all the texts proper to be preached on, and studied to understand the literal meaning of the words. . . . I accustomed myself on all occasions to form my meditations into discourse, and spoke aloud what occurred to my thoughts. I went over the body of Divinity frequently . . . and found a way of explaining every part of it in the easiest and clearest way I could, and I spent a great part of every day in talking over to myself [he thus suffered equally with Charles and William and Louis XIV.] my thoughts of these matters. But that which helped me most was that I studied to live in frequent recollection, observing myself, and the chain of thoughts that followed all good or bad inclinations, and thus by a course of meditation and prayer I arrived at a great readiness in preaching that has continued ever with me from that time.

No wonder that once at the Rolls Chapel, in London, when he had preached out the hour-glass and turned it over for another hour, the audience "set up almost a shout for joy." That was not the modern preacher or the modern audience.

Politically, Burnet's ardent temper was a traitor to his judgment. In theory he was an avowed Erastian and believer in non-resistance, but when the policy of James II. brought him the choice of muzzled compliance or rebellion, his temper won the day, and by slow degrees brought him to a stanch maintainer of church independence and political revolt—when circumstances brought religion and state into jeopardy. The inconsistency may be excused, perhaps, as more a matter of degree than of substance. But it brought upon Burnet not only the odium that always attends the middle course in times of heated prejudices, but also laid him open, unjustly, to charges of self-seeking apostacy. It is not a light matter to be accused at once of "trimming" and time-serving. "He strode a bespattered pilgrim through the miry ways of this sublunary world," impulsive, hot-headed, outwardly inconsistent, vain, presumptuous, sometimes ridiculous, yet he never quite lost sight of his youthful ideal of straightforward patriotism and zealous religion. And as a preacher of the *via media* he held the future in fee; the tumults of the hour have died away, and what was once despised by both parties is now the ruling common sense of the world.

Robert E. Lee. By Philip Alexander Bruce. Philadelphia: G. W. Jacobs & Co.

To make one of a new series of lives (American Crisis Biographies), is the sole and insufficient reason for this book, which discloses no new facts and lacks an alluring style. Lee proved the rule that adequate heredity and surroundings should culminate in the gentleman; and this fact the author elaborates, none contradicting. Without doubt Lee's course was determined for him by his progenitors, because of the sentimental and material associations born of descent and environment. It is set forth (p. 66) "as the Southern view" that "the people were citizens of their respective States [and] the individual citizen bore no relation to the United States, [so that] dissolution of the compact between the State and the United States served instantly to release from the obligations of their oaths all citizens of each State who were employed in the civil or military departments of the central government," and it is implied that therefore and in that way Lee became a Confederate. By such a doctrine, had Buchanan been a South Carolinian the Presidency would have been automatically vacated in December, 1860. The truth is that, great as Lee was, he could not withstand those closest ties of the well-born, the claims of blood, and he formally resigned his commission. However his views may have shifted later, while Virginia still held with the Union he admitted neither that there was an abstract right of secession nor that there was adequate reason for its exercise if the right existed. That he saw no imperative obligation, no question of conscience, which detached him from the defenders of the national integrity, is clear from his refusal to advise the resignation of his son under identical conditions. He states his own case thus:

> With all my feelings of loyalty and duty as an American citizen [and therein his principles are displayed] I have not been able to make up my mind to raise my hand against my relatives, my children, my home.

In so pure a man the struggle, which none in the Border States could avoid, was frightful; but in the end Lee participated in the revolution which he denounced and dreaded. We may protest, then, against the implication, not the open assertion, that in that crisis all honorable Virginians flocked as a matter of course to the standard of their State. Scott, Thomas, Robert Williams, Sykes of the fiercely-fighting regulars, St. George Cooke, Baylor, come without effort to the mind as among those patriots who did not reckon a part to be greater than the whole.

A wholly irrelevant and illogical discussion of the potential relation of slavery, culminating in the inquiry "Had the North foreseen all this [expenditure of blood and treasure] would she have undertaken the conquest of the South?" which is injected into this Life, is referred to here merely to deprecate so one-sided a view in a volume which may color the opinions of many readers. Slavery with Toombs and Davis replaced the tariff of the earlier South Carolinians as an occasion, not a cause, for dissolution. The effort of the Confederacy to secure its independence by arms and the determination of the Unionists to preserve the whole country, are constantly obscured. There is substituted a sectional war of subjugation with the view of abolishing slavery, for the essential motive of all the non-seceding States, including western [now West] Virginia, which was that of preserving the Union at any cost.

The portrayal of Lee's military career by a sympathetic but unqualified hand, requires no extended comment; and as there are no battle-field maps, the details of the engagements are not clear to readers unfamiliar with the *terrain*. Lee was forty years old when with Scott in Mexico, but he is persistently called "the young engineer"; his unsuccessful campaign against Rosecrans in West Virginia, to draw that mountainous section within the military bonds of the Confederacy, is condoned, because had he won a victory "he would have been compelled to fall back to his base of communications." Dr. Bruce further says: "After Cold Harbor Grant was saved from a counterstroke only by the rapidity with which he effected a change of base," whereas in fact Grant remained in Lee's front more than a week and then disappeared, as a strategical measure, with a secrecy and celerity that completely mystified his opponent. It was on almost that very ground that McClellan performed a similar feat in Lee's front two year's earlier.

Following Grant and certain independent observers, Dr. Bruce places Mr. Davis's character and opinions as Union assets, wherein we cordially agree. And from the beginning to the end every possible military sin of omission and commission, except that of not fighting vigorously when once engaged, is laid upon Longstreet, Lee's brave, persistent war-horse "Peter." Jackson seems overrated; Longstreet not appreciated.

Lee's civil career was one of peculiar service to the united country, and we gratefully adopt the biographer's estimate:

> The moderation, foresight, and wisdom displayed by him after the close of hostilities swell his figure to the proportions of a hero common to North and South.

President Lee not only set the example to his studious youth, and to his impoverished and disheartened ex-Confederates as well, but he inculcated national patriotism and unreserved allegiance to the general government. He made his college a centre of intelligent acquiescence in the result of the war, and on account of his own dignified resumption of Federal citizenship and the influence thus exerted, his memory will not only be beloved as that of a soldier of the South, but will be revered by both sections as an ultimate conservator of our domestic peace.

CURRENT FICTION.

Somehow Good. By William De Morgan. New York: Henry Holt & Co.

The industrious traveller is bound to find pleasant things here and there along the beaten path of contemporary fiction, but for the most part in the way of suggestion or promise rather than firm achievement. What a relief, once in a decade, to come upon a real story, not a mere fiction, but an *epos*, a living, intelligible word. Away with our rule of thumb, down with that anxious yardstick with which we are fain to gauge the ordinary commodity known as the latest novel: are we not coming into our own? "Somehow Good" confirms the testimony (if it needed confirmation) of "Joseph Vance" and "Alice-for-Short," that one of the true tellers is among us. "Is still among us," we had almost said, so strong is our impression of Mr. De Morgan as a conservative force, as one who has kept alive, and now brings forward, fresh and lusty, a something beloved which in our faintheartedness we had almost agreed to lament as dead. More obviously, of course, we are speaking of that Victorian fiction for the body of which embalmer and stone-cutter had done their worst when "Joseph Vance" appeared to confound them and set their offices at naught. For this was obviously not an exploit of the "resurrectionist," but an authentic survival. People had stopped imitating Dickens and Thackeray and the rest a quarter-century before Mr. De Morgan quietly took his place among those worthies. It would have been impossible for any young man to do this, impossible, indeed, for any professional writer whatever. Mr. De Morgan began to write out of a rounded experience to which books had made their moderate, let us say their normal, contribution. One hardly imagines that he had read much modern fiction; so that when, in his westering years, the mouth was moved to speak out of the full heart, his fancy was not troubled by the fashion of the hour. His natural speech was that of the masters whom in his boyhood no one dreamed of remanding to a past régime. Here and there, as in the opening chapters of "Joseph Vance," there is distinct, though probably unconscious, imitativeness; where it is most marked, Dickens is the obvious, and in these days loathed, model. Minor "character" parts and their attendant facetiæ unabashedly recall the traditions of Boz. But, after all, what really arrests us in these stories, what really gives us the delightful sense of recognition of which we are conscious, is a manner, a true style, not a mannerism. This writer's inconsecutiveness, his apparent casualness, is seen in the end to have been never unconsidered or irrelevant. He is in no manner of doubt as to what his story is or as to how he wishes to tell it. From his point of view, that of creative humor, he sees his theme steadily and sees it whole. All these delays, digressions, hints, repetitions, these hundred obstacles to hasty reading, serve to acquaint us as life acquaints us, gradually, and as it were by stealth, with the persons and events which concern us.

Such a method may safely deal with any theme. "Somehow Good," in which it is employed at its perfection, is built upon as ugly a fact as human experience can produce. Let us put it baldly: A young English girl, innocent and high-spirited, quarrels with her mother on a question of persistent remarriage, and sets off for India to marry an English boy who is at her devoted service. Before joining her boy at his station she is obliged to spend a month in the hands of a precious couple who conspire for her ruin. At least the married woman is complaisant, and the married man has his way. In due time and yet too late, the girl goes on to her lover. She lacks the courage to tell him what has happened, and they are married. Very soon she perceives that her horrible experience is to bear fruit; she tells her husband everything. He leaves her, and after an unsuccessful attempt at divorce, disappears altogether. The girl is rescued by an uncle, a major in the Indian army, and brought back to England. He retires, and lives quietly in London with the forsaken wife and her misgotten daughter. Twenty years pass. The husband has been a wanderer, in Australia, America, Canada, and has finally made a fortune in the Yukon. He returns to London, and one day is disabled by an electric shock, and is taken home by the daughter. The wife recognizes him at once, but the accident has destroyed his memory. To put it as shortly as possible, they are married again, and eventually he regains full remembrance of the past. In the end he is able to see that whatever has happened may have been "somehow good"; he, like his wife, adores the child of the wretch whose memory is a horror to them. What had happened remained vile in itself; in its result, who could say?

It is easy to imagine what morbidness—what repulsiveness or what sentimentality—would belong to the treatment of this theme by the ordinary novelist. Let the reader ask himself what would happen to it in the hands even of a Hardy, a James, or a Meredith. The fact we have to record is that on this theme Mr. De Morgan has written a book as sound, as sweet, as wholesome, as wise, as any in the range of fiction.

The Ancient Law. By Ellen Glasgow, New York: Doubleday, Page & Co.

Miss Glasgow writes, as always, with fluency, gravity, and a species of *empressement* which may go a long way toward achieving the effects of depth and subtlety. Her books are, we gather from the triumphant bulletins of her publishers, widely read, in the main we must suppose, by a class which does not read very much, and is guided to its few choices by the conversational clue. Her work is planned upon a generous scale. There are four books and forty chapters in "The Ancient Law," and they cover some five hundred pages—quite the old three-decker plan. After going over it all, one may find oneself speculating as to whether the cargo is worth the carriage. Superficially the book is of the right kind. The theme is older than Jean Valjean: What shall the convict do with himself when, with the best will in the world, he finds himself outside the bars? One Richard Ordway goes wrong on the stock exchange, and, after five years' imprisonment, is to face the world again. He seeks refuge from it in a Southern village, and there, under the name Smith, carves out an honest and not inglorious career for himself. He becomes, in fact, the local reformer and oracle, and the time arrives when, though they know nothing of his past, his fellow-townsmen are ready to give him the greatest public honor in their power. As an ex-convict, he is legally ineligible for this honor; but he regards himself as having sufficiently atoned, in any but the crude legal sense, for his past, and is prepared to accept what is offered in good faith. His past, however, has followed him, to confront him brutally in the hour of his mild triumph. He therefore determines to set out again upon his quest of service. Up to this point—the end of the second book—the narrative does not lack interest. Ordway himself, to be sure, with all the author's deliberateness of portraiture, is a person commented upon rather than presented. Our first impression of him is promising, but after the opening scene it wanes steadily in distinctness. We do not live with him through his experiences; we do not feel the charm and power in the man which are said to work such wonders in that stubborn rural community. But some of the minor scenes and characters have life; above all the gracious and strong figure of Emily Brooke, the beautiful girl who falls innocently in love with our jail bird. As he has a wife who has failed and repudiated him in his need, this, according to the code, should not have been allowed to happen; but the relation which develops between them keeps itself within the prescribed bounds. One would like to have parted with them both at the moment when, after the full revelation of his past, she professes her unalterable faith in him. But here begins the anticlimax, and the story sinks through chapters of crude melodrama whither we shall not follow it.

Travers. By Sara Dean. New York. Frederick A. Stokes Co.

If the spectacular and the melodramatic are ever to be looked for in real life, it is in such a setting as the San Francisco disaster afforded. The conditions described in "Travers" are probably not overdrawn and the adventures of the pair in question might find parallel, if not confirmation, in the records. Possibly these two have more than their share of narrow escapes, since one building is tumbled inoffensively about their heads by the earthquake, and another is subsequently burned to a shell with the exception of the floor upon which they are imprisoned. The unmasking by the catastrophe of forces both for good and for ill is effectively suggested, and the momentary abeyance of social convention makes plausible the sudden intimacy between Travers and his charge. Some of the minor figures—the harridan who berates all the women in the hill-side camp and slaves for all the men, and little "Montana," the nurse—are vivid and typical. The relation of the man and the girl, however fancifully brought about, is a sound and credible one. In short, though the tale is not of power, it is of interest both as a story and a document.

English Poetry, 1170-1892. Selected by John Matthews Manly. Boston: Ginn & Co. $1.70.

English Poems. The Nineteenth Century. Selected and edited, with illustrative and explanatory notes and bibliographies, by Walter C. Bronson. The University of Chicago Press. $1.50 net.

These two anthologies, though prepared primarily for the use of college classes, will prove serviceable to students of literature in general, and to lovers of poetry in particular. Professor Manly's book is complete in itself, but Professor Bronson projects three more volumes; one to include Old English poems in translation, Middle English poems, a few specimens of the pre-Elizabethan drama, and old ballads; one to cover the Elizabethan and Caroline periods; and one for the Restoration and the eighteenth century.

Professor Manly explains in his Preface that the plan of his volume originated ten years ago, when he and Professor Bronson and Prof. R. E. N. Dodge (now of the University of Wisconsin) were giving an introductory course in English literature to a class of 140 freshmen and sophomores in Brown University. The object was to have the students read as widely as their time permitted; but since no one volume was sufficiently comprehensive, and since the expense of numerous cheap reprints was too great, Professor Manly determined to "collect into a single volume all the pieces of non-dramatic poetry that any teacher would likely care to have at hand from which to make his own selection." In this undertaking Professor Manly has had the help of other teachers, and the result of their joint labors is a volume of uncommon utility. His 563 pages of text are printed in double columns, giving 112 lines to the page; and, allowing for titles, spaces between stanzas, and overrunning, there must be between forty and fifty thousand lines of the best English poetry.

The first eighty pages carry us through Middle English, Chaucer and his followers, Skelton, the early Tudor lyrics, and the ballads. All these poems are sufficiently elucidated by a copious glossary in the footnotes. But from Wyatt and Surrey on, the language offers few obstacles and the notes are correspondingly rare. Explanations of difficulties of thought or allusion Professor Manly has avoided altogether, on the ground that they can best be supplied by the teacher. In the Introduction, however, he has offered a few comments intended to supplement the ordinary textbooks. As regards Middle English, Chaucer, and the early Tudor period, this commentary is particularly full. His *obiter dicta* on later poets who for one reason or another have attained no wide popularity are brief but keen. For example, after speaking of George Meredith's depth of insight and subtle apprehension of life and its problems, he adds:

> But the gods gave him also the fatal gift of excessive intellectual ingenuity and a delight in the exercise of it; while the sole gift they denied him was self-restraint.

But the critical apparatus is less important than the text itself; for the main thing is that the student shall have access to the poet. In a volume ranging from the "Poema Morale" to Swinburne there is immense room for choice. No man who has read even discursively can go through any anthology without noting in every section the absence of poems which appeal strongly to his personal taste. But Professor Manly's book contains no poem that is not plainly entitled to admission, either because of its importance in the history of English verse or because of its "clear title to intrinsic beauty and value"—for these are the two tests which the compiler has applied. Moreover, the selection from writers of the second and third rank, who form the background for leading spirits of an age, is exceedingly judicious. We are glad, for instance, to see Watts's "Cradle Hymn," beginning,

> Hush, my dear, lie still and slumber,
> Holy angels guard thy bed!

and Charles Wesley's

> Gentle Jesus, meek and mild.

The minor poets of the nineteenth century, whose modernity gives them special interest, are well represented. Professor Bronson's selections are drawn from Bowles, Rogers, Wordsworth, Coleridge, Southey, Campbell, Scott, Byron, Moore, Shelley, Hunt, Keats, Landor, Tennyson, both Brownings, Clough, Matthew Arnold, Dante Gabriel Rossetti and Christina Rossetti, William Morris, and Swinburne. Manly omits Bowles, but he gives us Lamb, Charles Wolfe, John Keble, Mrs. Hemans, Hood, Praed, Beddoes, FitzGerald, P. J. Bailey, Locker-Lampson, Coventry Patmore, Sidney Dobell, George Meredith, "Owen Meredith," Sir Edwin Arnold, Sir Lewis Morris, James Thomson, and Alfred Austin.

Professor Bronson's book is better printed, a single column to the page, larger type, and thicker paper. The feature of it is the critical apparatus. The notes, in fine type at the end, include "the poet's theory of poetry and his philosophy of life when these can be given in his own words"; statements by the author or his friends which throw light on the meaning of a poem or illustrate his method of work; explanations of words or allusions which may be obscure to the average student; a few variant readings of special significance; quotations from sources or parallel passages; specimens of contemporary criticisms; and a selected bibliography. We have, for example, extracts from Wordsworth's prefaces, from Coleridge's "Biographia Literaria," and Shelley's "Defence of Poetry." The contemporary criticisms are a "cooling card" for the book-reviewer of to-day: Jeffrey's onslaughts on Wordsworth; the *Monthly Review's* declaration that "Christabel" is "rude, unfashioned stuff," and that "Kubla Khan" is "below criticism"; the "memorable and ferocious blasphemy" of Shelley's "Adonais," as the *Literary Gazette* viewed it; and *Blackwood's* advice to Keats, "So back to the shop, Mr. John, back to plasters, pills, and ointment boxes."

The ultimate value of such volumes as these depends upon whether English literature can be "taught"—a subject much debated in the columns of the *Nation*. In this discussion there has been some confusion both as to terms and as to the class of students for whom courses in literature may be intended. No one can deny that mental discipline may be derived from the study of English philology and also from the study of the history of literature. That branch of history, as well as politics, the development of industries, or art, has its legitimate place in the college curriculum. The doubt arises in regard to courses in appreciation of literature. Too often, we must confess, they are sentimental and sloppy—"chatter about Shelley." But a few teachers actually succeed—to use Professor Manly's words—in awakening "a love of literature and the habit of reading." This is worth doing; and in the present state of culture in America it must, for many persons, be done in college or be left undone. If a student has already, through happy influences at home or in preparatory schools, a well-formed taste and the habit of reading, he does not need courses in appreciation. He will probably find far better discipline in other studies and in wide miscellaneous reading out of hours. But under existing conditions and traditions, courses in appreciation meet a genuine need.

St. Stephen's in the Fifties: The Session, 1852-3, a Parliamentary Retrospect. By Edward Michael Whitty, with an Introduction by Justin McCarthy, and Notes by H. M. W. Pp. xl., 316. New York: A. Wessels Co. $3 net.

Well edited, the late Edward Michael Whitty's "St. Stephen's in the Fifties" would have been a valuable addition to the permanent literature of the British Parliament; for Whitty was a journalist of more than ordinary ability and insight; he possessed strong political convictions, and in the *Leader*, the now forgotten London Radical weekly in which these studies of 1852-3 first appeared, he had larger freedom of expression than any writer of Parliamentary studies for a serious journal has since enjoyed. But H. M. W. has taken little trouble with the editing. If ever there was a book to which copious footnotes were essential, it was this, because many of the men of whom Whitty wrote have either had scant notice, or have been ignored altogether, in the "Dictionary of National Biography," many of the political questions have long ago passed out of mind, and many allusions are now meaningless except to the few who are well acquainted with social life in the London of that period. Mr. McCarthy has contributed a helpful Introduction of thirty pages; but H. M. W. seems to have concluded that McCalmont's "Parliamentary Poll Book, 1832-1895," was the only source that he need draw upon for foot-notes. Some readers may possibly recall Paxton's connection with the building of Crystal Palace; but how many will understand, for example, Whitty's allusion to "Mr. Sloman of Chancery Lane"? H. M. W. has not taken the trouble to inform them that Sloman's in the old days of Whitecross and the Bench Prisons—in the days of imprisonment for debt—was a sponging house, at which men might stay for a day or two awaiting a settlement with their creditors. Again, on page 140, Whitty writes of No. 32, Chesham Place, as "our British Temple of Janus"; and H. M. W. has not thought it necessary to explain that No. 32 was the town house of Lord John Russell.

Whitty was of the Press Gallery about the middle of the Parliamentary epoch that lies between the Reform Act of 1832 and that of 1867. This was the period of comparatively narrow franchise; of numerous nomination and corrupt boroughs, which the Whigs had been careful should survive when they reformed the old system in 1832. It was the period of Sunbury, Oxford, and Canterbury, where political corruption was general and deep-seated; and the influence of these boroughs on the *morale* of the House of Commons is described with the utmost freedom. It was also the period during which members from Ireland were largely of the needy and office-seeking class. Whitty was an Irishman—and an Irishman from Cork—but nowhere in the literature of the House of Commons are there more caustic descriptions of the men who represented or misrepresented Ireland than those he wrote. In these papers, also better than in any history of political parties in England, and much better than in any general history, are given the reasons why Radicalism was so feeble a force in Parliament between 1832 and 1867. There were not wanting large constituencies such as Bath and Sheffield willing to elect Radicals. But most of the Radicals in the House were intent on their own political hobbies. They had no recognized leader, no organization such as that of the Independent Labor party of the present day. There was, in a word, no team work; nothing to inspire either the Tories or the Whigs with any real fear.

Social conditions in the House were not much different from those that had prevailed up to 1832. The House was still regarded as a club; and late in the evening members were not afraid to appear there in a condition that to-day would warrant their being put into a cab by the attendants and sent home; and if a member, when drunk, made a fool of himself, Whitty did not hesitate to describe the scene. His disgust with what he described as the "Celtic gentlemen who make a 'holy show' of themselves after the manner of their race in the Imperial Senate" was deep. The Home Rule movement, as organized by Parnell, rid Ireland of the school of Parliamentarians who provoked such loathing in Whitty—of the race of members whose haunting of the Treasury on the hunt for patronage aroused such strong feelings of contempt in Bright. For this great reform in Irish politics the Home Rule movement seldom gets credit; and one incidental value of Whitty's sketches is that they show how necessary such an extra-Parliamentary reform had become by the time of the Aberdeen Coalition Ministry.

One of the best pieces of purely descriptive writing is Whitty's account of Gladstone's great Budget speech of April 23, 1853. Taken in conjunction with the late Duke of Argyll's description of Gladstone's preliminary exposition of his fiscal proposals to the Aberdeen Cabinet, assembled at No. 10, Downing Street, it constitutes a new chapter in the life of Gladstone, and admirably supplements Mr. Morley's account of Gladstone's great triumph.

A Book of Saints and Wonders, Put Down Here by Lady Gregory, According to the Old Writings and the Memory of the People of Ireland. New York: Charles Scribner's Sons.

In this volume, which is of the same type as her "Poets and Dreamers," 1903, Lady Gregory continues her task of translating Irish texts, and recording legends still current among the aged Irish. The stories of the saints and the personal anecdotes of minor miracles collected here, reveal ready imaginations, ready tongues, and intelligences weighted and saddened by superstition of the most childish sort. For example:

> Brennain came to Brigit one time to ask why was it the beasts of the sea gave honor to her more than to the rest of the saints. Then they made their confession to each other, and Brennain said after that, "In my opinion, girl, it is right the beasts are when they honor you above ourselves."

Page after page of this collection is devoted to this sort of testimony, and contains nothing of the vitality and color of the Irish heroic saga, not a gleam of the true genius of the Gael. The friends of Ireland, like those who ransack the literary remains of great men, are too apt to drag into the light what was never meant by its author to stand the test of print.

More welcome to the lover of Gaelic tradition are the translations of the "Voyage of Maeldune" and the "Voyage of Brendan." Maeldune is the Odysseus of Ireland. But his saga lacks the fine Homeric reserve of the "Odyssey," in which the fairy element is never allowed to degenerate into a mere recital of a string of marvels. The adventures of Maeldune on his quest to slay the murderer of his father have no sort of sequence, and the quest itself drops out of the reader's mind as he drifts with the hero and his crew from one island to another, landing on very few, and constantly warned off by the sight of some monster or by mysterious doings that are to have no influence on any man's future fate. But in spite of frequent lack of shape and savor in this tale, a dull page is often redeemed and dignified by a sudden expression of sorrow:

> Then he turned his face to the wall of the house the way it would be darker for him, and he raised his wild song, and it was the sweetest of all the music on the whole ridge of the world. And all the men of Leinster were crying and lamenting, with the sorrow and the softness of that song.

So Menelaus, in his regret for the lost Odysseus, moved Helen and all that heard him to weeping. The joy of battle often sits awkwardly on these minor heroes of Irish legend, but you will find them acquainted with all the tones of grief.

The "Voyage of Brendan," hitherto accessible in modern English only in O'Riordan's version, is also the story of a quest. Brendan sets out for the Land of Promise, Brendan's Isle, and finds it only after long wanderings very similar to Maeldune's. This island was long believed by the Spanish and Portuguese to lie in the direction of the Canaries, and was even mentioned in international treaties with the saving clause, "when found." The Isles of Sheep and Birds visited by the saint were known to Arabian wonder-books; and the great fish, like an island, on which his party landed, figures in Sinbad's story as well as in most mediæval bestiaries. The "Voyage of Brendan" is the *locus classicus* for the legend of the annual day of mercy for Judas—

> Once a year I go
> To cool me on the floe—

whom Brendan protects for a few hours from the fiends who come to drag back the tortured ghost.

The precise influence of classic myths on Irish tradition is hard to determine. But even the few legends collected here contain several parallels with the classics. The devoted queen with whom, in spite of his impatient crew, Maeldune lingers for six months, and whom at last he leaves weeping on the shore, is the Irish Dido. In the story of Columcille, an old, spent white horse, a humble counterpart of the horses of Achilles, "cried tears into his breast until his clothes were wet." And Diarmid, his servant, would have driven the old horse away, but Columcille said: "Leave him till he cries his fill, keening for me. For you are a man having reason," he said, "and you know nothing of the time of my death but what I myself have told you. But as to this beast that is without reason, God himself has made known to it in some way that its master is going to leave it." Among the stories about St. Patrick is a curious echo of the Tithonus legend. A man and his wife are granted eternal youth, but not so their children, and while, like the dawn, they bloom without fading, they have to watch the painful decrepitude of their children's children.

Lady Gregory's style has this great advantage to Irish readers that it carefully preserves the un-English, curiously inverted forms of speech of the Irish countrypeople, from whom she received many of the legends:

> The justice of God threw a mist about him the way he would not be known.

> I have my fill of riches if I thought it enough, wanting Ireland, in the strange country where I have chanced and I tired. It is a pity the journey that was put upon me . . . it is bad to me the way it is.
>
> And it is what happened, I was a cook in Toraig, and it is a bad cook I was.

That is the way the country-people in Ireland speak today, giving one the impression that they are translating Irish idioms, as, indeed, many of them are. These are the turns of speech that are seldom correctly caught by those who try to write the Irish dialect.

Zur Kritik der künstlichen Weltsprachen. Von Karl Brugmann und August Leskien. New York: G. E. Stechert & Co.

In the light of the recent Esperanto Congress in England, this little volume of the well-known Leipzig professors will prove full of interest. Particularly should it challenge the attention of language students generally, for it is sweeping and specific in its condemnation of the whole enterprise as worthy neither of the scholar nor the practical man. Under the title of "Die neusten Weltsprachprojekte," Professor Brugmann reviews the various circumstances in which a second language may come into competition with an older one, and notes that a plan suggesting itself naturally to many is to select the most adaptable of the competing tongues as the international medium of communication. National pride and jealousy prevent any such solution, however, and in their perplexity men rush to the making of new languages. As a result, there are already "many dozen" of these, none of which is quite free and independent of the language it is expected to drive out. The dictionaries of artificial languages show the greatest variety of vocabulary, and in only one thing do they seem ahead of old-time forms of speech. and that is in their simplicity. As a matter of fact, however, a really practical result has never been achieved by any of these made-up tongues. Twenty years ago witnessed a high-tide in artificial language, when Volapük came from the hand of the Catholic priest Schleyer. Everywhere there were courses and lectures about the new tongue, and according to "Schleyer's Weltsprachkalender" for 1890, there were two and a half million students of Volapük, 290 Volapük clubs, and 23 Volapük journals. An international congress of Volapükists assembled at the Paris Exposition of 1889, and then, suddenly—the bubble burst.

The grounds for this failure are many. There were few who really knew much about languages who either advocated Volapük or took the trouble to oppose it, and Volapükists had all along pinned their faith to such men as professors of zoology or astronomy. The chief reason, however, was the conviction forced on many that Volapük needed revision and further adaptation; and Schleyer refused to admit weakness and consent to a change. Then, as Professor Brugmann might have shown in detail, there was split after split in the ranks, and new and competing language clubs were formed.

To-day we have another high-tide, for Schleyer had no patent on Volapük, and soon came "Esperanto" (1887), "Kosmos" (1888), "Spelin" (1888), "Myrana" (1889), and the "Lingua internazional" (1890). The advocates of each of these artificial languages wish it to be declared by academy and government the best adapted to science, industry, and commerce; and the means taken to secure recognition are always the same—clubs, lectures, congresses, and language journals. Once the geographer Kirchhoff worked hard for Volapük, and now the Esperantists, who certainly seem to lead the modern procession, have captured the enthusiastic chemist, Wilhelm Ostwald. But even in the world of learned men it is necessary to distinguish between the specialist and the amateur. Linguists only should be competent to judge, yet every one who has studied a language or two in a high school believes himself capable of passing opinion, and thus justifies Goethe's sharp remark: "Ein Jeder, well er spricht, glaubt auch über die Sprache sprechen zu können." As to the majority of scholars, it is probably true that they are neither for nor against the movement, unwilling to devote their time or energy either way. Max Müller was an exception, but his desire to shine before the world, Professor Brugmann thinks, led the Oxford professor to seek the cheap applause of the Volapük arena. In considering the question as to whom an artificial language will chiefly benefit, Brugmann derides the idea that the scholar will add another strange language to his equipment, or that he will labor with unprecedented zeal in order that grandchild and great-grandchild may have it. Brugmann is equally *lustig* at the thought that all the scientific literature of the world will soon be translated into Esperanto, "even with the help of those women who have nothing else to do"!

Professor Leskien contributes a scholarly discussion "Zur Kritik des Esperanto." He says that a world-language should be easily learned, simple in construction, and easy to pronounce. Esperanto, he admits, may be rather easy to learn to read; but for a language designed to be spoken by Europeans of all classes, it is astounding how many difficulties it presents. Esperanto, according to his view, uses the sound *tsch*, *dsch* too frequently; it is overloaded with *au*, *eu*, *ai*, *ei*, *oi*, *ui*, which French avoids; it includes such combinations as *kn*, so unwelcome to the English, and bristles with *kiu*, *kia*, *kie*, *tiu*, *tio*, and *tschia*, which Germans, English and Americans, Italians, French, and Slavs must pronounce according to their peculiar linguistic bias. In short, Professor Leskien contends that the inventor of Esperanto put together on paper his outfit, gathered from school-grammars, without any attention to phonetics or any actual experience in the real world of language, without finding out from others (who might have known better), what was difficult or easy, necessary or unnecessary, rational or irrational. His work, therefore, as an effort to solve the problem of a world language, is quite unsuccessful. In conclusion, Professor Leskien maintains that Esperanto is difficult, stating that he himself has studied and mastered so many languages that he feels competent to make a comparison, and that he has found the new tongue of Zamenhof hard, if not impossible, to master. Those who know Professor Leskien's fluency in Slavic tongues will find this judgment of peculiar interest.

Society in the Country House. By T. H. S. Escott. Philadelphia: George W. Jacobs & Co. $4 net.

The evolution in England of the country house, its social and political influence, is an inviting subject, to be handled, of course, only by one who has had the *entrée* to several of the leading sets of English society, and as a looker-on could judge of the game better than the actual players. Mr. Escott, who succeeded John Morley as editor of the *Fortnightly Review*, and who has been for many years a leader writer for the London *Standard*, has watched rather than shared the strife of social cliques and political parties. A great part of that strife has been planned at "week-end" parties, for the salon of the English country house has seldom been what Horace Walpole made Strawberry Hill, a centre of disinterested social activity.

Mr. Escott traces the rise of country house entertaining from the days of Chaucer's fourteenth-century franklin, in whose house "it snowëd of meat and drink," down to the "week-ends" of a Rosebery. It was prosperity in foreign commerce that made the rural homes of Chaucer's England centres of hospitality; for with the great landowners money was rather scarce. They were the true barbarians, as Disraeli described them in "Lothair," leading an outdoor life, never opening a book, knowing no language but their own, while the men with more money and less land entertained all comers and encouraged political discussions. So it is that nowadays it is entertainers like the Wilsons of Tranby Croft or the Rothschilds who are maintaining the old tradition. From his historical sketch Mr. Escott passes to descriptions of certain houses which for generations have played their part in English politics. Not that their influence has been merely political. More than one prosperous watering place owes its existence to the near neighborhood of a great country house. So Stanmer, the Sussex home of the Pelhams, created Brighton, which might never have had its vogue had not George IV. chanced to visit Stanmer and fix his fancy on the little fishing village of Brighthelmstone. So the Allens of Prior Park made the fortune of Bath by bringing it to the notice of the children of George III., and Heron Court, the home of the Malmesbury earls, made Bournemouth the fashion.

The political activity of the country house has long been an English tradition. Says Mr. Escott:

> The English Revolution of the seventeenth century originated in the conferences at each other's rural homes of country gentlemen. The doctrines of royal absolutism were first framed by a Kentish squire, Sir Robert Filmer of East Sutton, . . . when, as a Hertfordshire squire, entertaining James I. at Gorhambury. From the home and birthplace of John Pym, Brymore, proceeded the first notes of a counterblast to the pretensions of prerogative.

Lord Randolph Churchill's Manchester speech in 1886 announcing the formation of the Union party, was the fruit of a visit to Compton Place, Sussex, where the Cavendishes and the Churchills agreed to sink their earlier differences and unite against the Home Rule policy of Gladstone. So, on almost every page, Mr. Escott points out the association of some country house with political schemes. There are few neutral country houses. But Killerton Park and Holnicote, the homes of the great Devon and Somerset family of Aclands, saw the beginning of an experiment designed to bring together in their social life politicians of both parties. Here, in the favorite haunt of William Wilberforce, the Abolitionist, was first formed the idea of Grillion's Club, whose weekly dinners have for many years brought to the same table the fiercest political foes.

Such a book, teeming with information and anecdotes, could not fail to be interesting, but every reader will regret that the author took such pains to be unintelligible. It is as though one who had so long been obliged to write lucidly for mere journalism had decided to indulge in the luxury of an involved "literary" style. Mr. Escott is so allusive that often only the instructed reader knows whom he is talking about. This is the nearest that he gets to naming Lord Milner:

> Another of the then Mr. Goschen's guests, exactly Dawkins's contemporary, was that descendant of the General Ready of Goodwood associations, as accomplished a Balliol scholar as the future Lord Chancellor himself, and whose name in later years was to become a controversial synonym for a particular school of South African and Imperial statesmanship generally, Mr. Chamberlain's High Commissioner.

Mr. Escott always prefers a definition to a mere name. Balliol is regularly called "the College of Jowett," Byron is "the object of the Countess Guiccioli's passion," Disraeli is "the Asiatic statesman," Hever Castle is "the natal stronghold of Queen Elizabeth's mother." But in spite of his irritating allusiveness, his tortuous style, and his really shocking French—he writes more than once *pied de terre* for *pied à terre*, and other phrases that betray unfamiliarity with the language—Mr. Escott's book is entertaining, a mine of information for some more accomplished writer on the same theme. The frontispiece is a charming reproduction of the picture by Desanges of Lady Waldegrave's salon at Strawberry Hill in 1865.

The University of Toronto and Its Colleges, 1827-1906. Published by the Librarian of the University.

Following so closely upon the heels of the Report of the Royal Commission on the University of Toronto, this volume is of more than ordinary interest and importance, not merely to the alumni of the university, but to all interested in higher education. It is a fact not without significance, that in educational matters the international boundary is fast becoming obliterated. Not only is a wholesome reciprocity practised in appointments to the faculties of American and Canadian colleges, but to an ever increasing extent the young men of the two countries are seeking the best university for their individual needs, irrespective of its geographical position north or south of the boundary.

The present volume is the outcome of a decision of the senate of the university, as long ago as January, 1903, that in consideration of the fact "that the present year (1903) is the sixtieth anniversary of the opening of King's College, and the fiftieth anniversary of the organization of the university on its present line," a volume should be prepared, giving an account of its past history and its actual condition. The long series of delays in publication has enabled the editors to bring the historical survey down to the close of the labors of the commission in the passing of the University act of 1906. In the opening chapter, President N. Burwash of Victoria College sketches the early history of the university, from the granting of a charter to King's College, in March, 1827, down to the organization of the university in 1853; and in the two following chapters, Dr. Burwash brings his survey down to 1904, discussing in an eminently clear and impartial manner the once burning problems of state control and endowments, rivalry between University College and the affiliated institutions, the relative status of their degrees, central versus local examinations, etc. Chapter iv. is devoted to financial history, by the present bursar. Four chapters are given to the arts faculty and colleges; that on the arts faculty, by Dean Ramsay Wright and Prof. W. J. Alexander, being of exceptional interest. The faculties of law, medicine, applied science, the theological colleges, and the affiliated institutions, are dealt with in separate chapters, and the eminently practical subject of buildings and equipment occupies the final chapter. Appendices contain lists of members of the governing bodies, publications by members of the staff, studies published by the university, theses, benefactions, graduates, candidates examined, attendance, the university acts, and the report of the Commission, 1905-6. The whole work is under the general editorship of Professor Alexander.

The Real Australia. By Alfred Buchanan. Philadelphia: George W. Jacobs & Co. $1.50 net.

The author of this book is an experienced journalist. He has recorded his observations on the dominant features of Australian life—politics, amusements, journalism and literature, the tone of society, moral reform and the conditions with which it contends; and the result is a welcome offset to the books which have dealt with the subject in detached phases, more particularly with the political history of the country and the socialistic experiments made there. Hitherto we have had many optimistic forecasts and generous appreciations, which assumed Australian stability and success. Mr. Buchanan is rather doubtful as to the outcome. At least he thinks that the national spirit is in urgent need of a Spartan bracing. It is discouraging, though perhaps not astonishing, to learn that after half a century or more of unhindered political experimenting the prevailing phase of Australian character is its irresponsibility. Moreover, as there has been little in the history of the country to awaken strong sentiment, unless it be disgust at the way in which the aborigines were treated, there is no vital faith of any kind nor even any vital fanaticism. It may be that the ease of Australian life accounts in part for this lack of tone. There have been few soul-testing troubles, and no armed conflict, if we except the work of the contingents in South Africa during the Boer war. The calm of unforced development has been the lot of Australia, the spoiled child of Britain.

It is difficult to see why he has not discussed this doubtful result in the light of socialistic theories and legislation, which have been so hopefully applied in Australia. The lack of any such attempt is the chief defect of his book. Conditions are better described than explained. An American reader naturally asks whether there is any connection between a socialistic régime and the easy going, work-shirking habits which Mr. Buchanan charges against his countrymen. Is it true that reliance upon government for work, land, and shelter has caused a lapse from energy to ineptitude? Not only have trades unions been protected, but women have been given the suffrage in some of the states, and their vote is influential. Advanced theories have had their chance. Yet the social fabric, according to Mr. Buchanan, lacks a strong leaven of individual responsibility, initiative, and self-control. It is easy to believe that too much coddling by the government and too great trust in mere legislation are largely accountable for this condition.

Some of the Australian types described are too interesting to pass by. It appears that the Australian larrikin is the crown and summit of moral irresponsibility. Mr. Buchanan will not allow that all the hooligans of London, all the gamins of Paris, all the lazzaroni of Naples, even all the unspeakable ruffians of Cairo and Port Said can eclipse, or even approach, the reputation acquired by the larrikin in a few decades. Mr. Buchanan ought to be a capable judge of a native product.

Science.

Comparative Anatomy of Vertebrates. Adapted from the German of Dr. Robert Wiedersheim, by W. N. Parker. New York: The Macmillan Co. $3.75 net.

This book, written by a professor of anatomy in Freiburg and translated by a professor of zoölogy in the University of Wales, is now issued in a third edition, founded on the sixth German. The original contains 800 pages and 416 figures; the second English edition, 488 pages and 367 figures; and the present, 576 pages and 372 figures. That a technical work of this size should reach a sixth edition in the original language and a third in another is ample proof of its general excellence. It is likewise warrant for what, under other conditions, might constitute hypercriticism. In the present instance there is no excuse for lack of clearness; and for inaccuracy the only justification is the advance of knowledge since the volume went to press. As indicated in the preface and upon the title-page, this is not a literal translation, but a reduced "adaptation," a task which throws upon the undertaker greater responsibility for errors, omissions, and infelicities of expression. The preface states that this edition "has been almost entirely rewritten." That the changes have not always been for the better may be seen by comparing with corresponding passages in the previous edition the statements as to, *e. g.*, the cerebellum of sharks and rays (p. 210), and the brain-cavity of Amphioxus (p. 204). In this last case, the omission of the phrase "in the larva" (p. 157 of the previous edition) conveys an error as radical as would be embodied in the declaration, "man has a short triangular tail" without the qualification, "at a certain stage of development." In the original the discussion of the nature and origin of the limbs opens with a paragraph in which the problem is said to have been "seit einer Reihe im Vordergrund." In the second English edition this phrase was rendered "attacked vigorously during the last thirty years." In the present edition, ten years later, the entire paragraph is reproduced, verbatim.

There is, of course, room for a legitimate difference of opinion as to the selection of subjects and the extent of their treatment, but the reviewer believes most anatomists will regret the omission, for instance, of the observations of Charles Hill upon the primary segments of the brain. Among errors are the ascription of the middle commissure to mammals only (p. 201), the description of the cerebellum of Teleosts as always bent backward (p. 214), the designation of the olfactory tracts of Reptiles as "nerves" (Figs. 166, 167), and the misrepresentation of the pons in Fig. 170, B.

The extensive and well-arranged Bibliography of the previous edition has evidently been augmented, and probably now embraces the six hundred additional titles of the last German edition; but there are signs of carelessness in, *e. g.*, the inclusion in the literature of the brain of mammals (p. 528, fifth from foot) of a title referring exclusively to the amphibian brain. The index lacks at least a score of important entries, including the entire series of compounds (*mesocoele*, etc.), by which are designated (p. 203) the cavities of the several brain-segments. Notwithstanding the defects above enumerated, this is the best English treatise upon vertebrate anatomy as the original is the best German.

The pupils of Prof. Ernst Haeckel and the friends of monistic philosophy, of which he is the leading protagonist, have furnished him with the funds to establish a Phyletic Museum in Jena. For this structure the cornerstone was laid on the last anniversary of Goethe's birth; and the museum and its collections will probably be ready for students during the coming summer. In the *Blätter des deutschen Monistenbundes*, Professor Haeckel has described in detail the character of the new institution. The purpose in all of its departments, anthropological, biological, and other is to furnish as complete collections as possible illustrative of the principle of evolution. Haeckel will contribute his specimens secured during his three scientific journeys: that of 1873 to the Red Sea, that of 1881 to Ceylon, and that of 1901 to Java and Sumatra. He also gives his entire correspondence with the naturalists of the world, extending through fifty years.

Sir Thomas McCall Anderson, regius professor of medicine in Glasgow University since 1900, has died suddenly at the age of seventy-two. Dr. Anderson had a distinguished career as practitioner and educator, and was member of various learned societies of England, Austria, France, and America. He was the author of "Treatment of Diseases of the Skin, with an Analysis of 11,000 Consecutive Cases," and of various other works in that department of medicine.

The death is reported from Paris of Alfred Jolibois, who was for twelve years at the head of the Department of Bridges in Paris before becoming municipal councillor. He devoted himself with enthusiasm to the work of beautifying Paris and improving all the works connected with the Seine, especially the bridges. He also gave much attention to popular scientific education, acting in turn as one of the professors of the Association Philotechnique, and superintending the formation of popular schools to train skilled workmen. His "Bibliothèque du Conducteur des Travaux Publics" is one of the largest engineering compilations ever undertaken. Fifty-three volumes out of the seventy-three contemplated have already been published.

Drama.

The English version of Paul Hervieu's "Le Réveil," which Miss Olga Nethersole presented in Daly's Theatre on Monday evening, is a curious medley of social comedy, historical romance, lurid melodrama, and raw emotionalism, but it supplies internal evidence of the ingenious construction and strong dramatic and romantic interest which won public and critical success for the original in Paris. That cosmopolitan scalawag, Milan of Servia, and his son, the degenerate Alexander, are supposed, with sufficient plausibility, to have been the models of the two exiled princes, who play such prominent parts, but the historical groundwork of the plot is too slight to be of the least consequence. In dealing with such characters, fiction is, indeed, likely to be preferable to fact. Actually Prince Grégoire, with all his cheap cynicism and unscrupulous audacity, exhibits a degree of virility and kingly spirit perfectly inconceivable in his alleged prototype. But the true value of the piece—which is, of course, different from the theatrical—does not consist in the conflict between father and son, or in the series of striking and well-devised melodramatic expedients by which the former succeeds in breaking the spell of the passion which blinds the latter to all principles of duty and honor, but in the finely imagined scene of the "awakening" itself, where the innocent pleadings of her daughter, rendered eloquent by virgin love, rouse the conscience of the erring mother and recall her from the edge of the moral precipice upon which she is tottering. Here is a really dramatic situation, brought about in a perfectly logical and legitimate way, and of poignant interest. It is worth all the rest of the play put together, and upon it the fate of the representation will largely depend.

"Kaiser Karls Geisel: ein Legendenspiel," by Gerhart Hauptmann, is imported by Lemcke & Buechner. Whatever may have been the disappointment at Hauptmann's "Und Pippa tanzt!" with its mysticism and riddles so strangely different from the spirit of "Die Weber" or even "Die versunkene Glocke," this latest dramatic venture is likely to provoke enthusiasm, at least in Germany. Hauptmann now returns to verse, the form in which he presented his most successful composition, "Die versunkene Glocke." He has taken a paragraph from Sebastiano Erizzo's "Le sei giornate," which states that King Charles fell so deeply in love with a young girl that he abandoned all thought of the government of his kingdom. In a series of dissolving pictures, the dramatist has drawn contrasts between winter and spring, the frosts of old age, and the flowers of youth. In the end Karl is saved from downfall and made to appear triumphant, with upraised sword, before the acclaiming multitude. The story gives the poet an admirable chance to depict the virility of the aged Frankish king and the voluptuousness of the village maiden. The language, we may add, though poetic, is very frank.

Music.

A History of Music in England. By Ernest Walker. New York: Henry Frowde. $2.50.

When Sterndale Bennett, who was born three years after Wagner, went to Leipzig he was greeted, as Schumann wrote, by the remark: "An English composer? no composer at all!" Throughout Germany and elsewhere, until recently, the opinion prevailed that from the beginning to the present day England has been an out-and-out unmusical country. As late as 1885 Naumann issued the last volume of a "Musikgeschichte," in which four pages out of 1,200 were devoted to England; and even Nagel, who wrote two scholarly volumes on music in England, seemed to be convinced that artistic life in that country came to an end about the year 1700. The injustice of such an attitude is made abundantly apparent in Dr. Walker's volume. He modestly calls it "a" history of music in England, but it is really "the" history of music in that country. His avowal that this book has been "designed from the standpoint of a musician rather than from that of an antiquarian; and even then more for the general music-lover than for the technically erudite," must not be construed as a confession of superficiality; for, as a matter of fact, the best and most useful results of research are embodied; and, what is more, opportunity is afforded the reader, by means of copious musical illustrations printed in the text, to form his own conclusions.

It would have been too much to expect the author to resist the temptation to boast that whereas musical Italy can barely show four centuries of creative work, and Germany and France half a century less, England gave to the world nearly 700 years ago "the finest artistic work it ever had." The reference is to the famous four-part canon "Summer is i-cumen in," of the thirteenth century, which Dr. Walker, after carefully weighing the conflicting opinions, accepts as an early specimen—and a superb one—of English folk music. His statement that "few musicians have been found to question the assertion that Irish folk-music is, on the whole, the finest that exists," would not escape challenge in Germany and Russia; but this is certainly an aspect—the only one—in which the music of the United Kingdom does not suffer by comparison with that of the Continent. Ireland has also produced three composers of exceptional gifts—Balfe, Stanford, and Field. Of Stanford's opera "Shamus O'Brien," the author says justly that it is "one of the most deliciously 'open-air' works in all British music," being "crammed full of tunes which, without any suspicion of plagiarism, seem to suggest that their composer has lived in the wilds of Ireland all his life." Field occupies a place of honor in musical history as the originator of the nocturne, which Chopin imitated and perfected. But this, as the author frankly acknowledges, is the only case of the work of a composer on these isles having had any germinating force outside his own country. Even Handel, when he made England his home, sacrificed all chance of guiding the course of Continental music. "There has never been a composer of more than the merest second-class rank who owes him anything really vital."

We know of no chapter on Handel so luminous and unbiassed as Dr. Walker's. He claims Handel as an English composer, because Handel lived in London over forty-five years and wrote exclusively for English audiences, his early works, written for Germans and Italians, being now known to hardly any one. This chapter cannot be too highly commended to practical musicians, as it will help to correct the impression that nearly all of Handel's best work is contained in his oratorios. His operas are obsolete because they lack dramatic characterization, and because many of their airs are written in an ornate style no longer cultivated by singers. Nevertheless, there is in these Anglo-Italian operas—thirty-six in number—an almost unworked mine which singers of an enterprising turn of mind would do well to examine. A list of the best of these airs is given on page 194; the author should have added that Robert Franz selected. edited, and published the best of these in several volumes.

Though it originated in Italy, no form of music is so English as the madrigal, and this receives full attention. In the chapter "Later Victorian Music" no living English composer who was born later than 1860 is included, the list being thus limited to five—Mackenzie, Parry, Cowen, Stanford, and Elgar. We specially commend Dr. Walker's remarks on the last-named. In the concluding section an attempt is made, not very successfully, to determine what is the English element in music.

Oscar Hammerstein has proved that it pays, after all, to produce operatic novelties in New York. Beside reviving Offenbach's "Les Contes d'Hoffmann" he has already this season staged three novelties—Massenet's "Thais," Charpentier's "Louise," and Giordano's "Siberia"—and on February 19 he intends to try Debussy's extraordinary "Pelléas et Mélisande." When he announced "Siberia" the knowing ones shook their heads. The same composer's "Fedora" had failed lamentably at the Metropolitan, although the cast included Caruso; how could "Siberia" succeed at the Manhattan without even the aid of a great star? But "Siberia" did succeed; its reception by the audience was enthusiastic. In writing his "Fedora" the composer expected that the popularity of the play of that name would help him, but it did not; the play is not suited for musical treatment and Giordano's musical setting of it proved so surprisingly weak that it seemed impossible that the same pen could ever write an interesting score. But "Siberia" is decidedly interesting, both musically and as a spectacle. It pictures life on the desolate and snowy steppes. For killing a prince who entertains the girl he loves, a soldier is sentenced to penal servitude for life. The girl follows him, joining the living chain of prisoners. A chance for escape presents itself to the lovers, and they flee; but a miscreant gives the alarm and the girl is shot. It cannot be said that Giordano's melodic fount flows much more freely in the music with which he illustrates these scenes than in "Fedora"; but he was so wise as to introduce several beautiful Russian folksongs appropriate to the situation (as Humperdinck introduced German folksongs in "Hänsel und Gretel"), and that makes all the difference in the world. At the same time it must be admitted that Giordano's skill in the treatment of the orchestra and in creating "atmosphere" and working up a climax has greatly increased. He may yet become a serious rival of Puccini.

The Italian publisher Ricordi three years ago offered a prize of $2,500 for the best English opera. It has now been awarded to Dr. E. W. Naylor for a score entitled "The Angelus." Dr. Naylor is instructor and organist at Emmanuel College, Cambridge. The number of manuscripts submitted to Ricordi was 191.

THE INTERNATIONAL.

London, January 22.

The eighth exhibition of the International Society of Sculptors, Painters, and Gravers, now open in the New Gallery, does not, as a whole, reach the high level of the past. This is evident, especially in the paintings. I have looked in vain for the great pictures that stand out with the distinction there is no escaping. Much of the interest of the collection still comes from painters of an earlier generation. Again there is a chance to see Renoir's extraordinary Portrait de Madame M., the woman standing by a bird cage, extraordinary because of the beauty that fine drawing and tone can lend to costume and detail hideous as the fashions of the early seventies could make them. Monet is at his best in the three pictures here, Vue de Hollande, Printemps, and Fruits, a wonderful still-life; all three show the regard for composition, for the placing of a subject, to which Monet of late years has paid less and less attention. Another of the more notable pictures is Carrière's large Théâtre de Belleville, that huge dim interior, lost in the fog of Carrière's mannerisms, and yet with beauty looming through in the great swinging curve of the principal lines, and tragedy in the intent faces peering through the shadows.

Among contemporary painters are groups of, more or less, independents in France and England, whose one point in common is the inclination to find inspiration and motives in the past. The contrast in results is curious. From France comes Maurice Denis, deliberately, self-consciously primitive and naïve. He paints Sainte-Cécile and La Danse, according to his idea of how early painters, Flemish or Italian, should have painted these subjects. They were Primitive, as we call it, not because they aimed at Primitiveness, but because they were doing as well as they could with the knowledge and means at their disposal. That is precisely where M. Denis differs from them. He is Primitive because he uses the knowledge of to-day to affect ignorance, because he does his best to take over limitations that do not belong to him or to his age. Never were the draperies of saints and dancers expressed by such elementary lines, never were meadows powdered over with blossoms of quite such naïve growth, never were the faces of saintly men and women so expressive of vacuity. The color too is reduced to the last degree of simplicity, empty white set against flat spaces of immature green. This is the Frenchman. But the game of the Englishman I would contrast with him, Charles Ricketts, is another matter. He, too, goes back to an earlier generation for his models, but he takes not the men who were feeling their way like children, but the giants who had found it. He would pit himself, apparently, against no less a master than Michael Angelo, he would build up from the nude a tremendous composition in the manner of the great Florentine. Mr. Ricketts has two pictures at the International: The Resurrection and Don Juan in Hell. In the first, a column of naked figures rises from top to bottom of the canvas; dark, murky figures, stretched and distorted, in the midst of blue space. In the second, a horseman, naked, with drapery of Titian crimson flying behind, tramples on a mass of nudities, the note of the same crimson repeated in a bit of drapery emerging from somewhere in the chaos of vague forms. Subjects both for Michael Angelo, if you will; subjects, however, which he would have left, not dimly conceived, but vigorously executed. Mr. Ricketts has, apparently, neither the vigor nor the drawing to pursue them further than in these two small canvases, which are no more than tentative sketches. If M. Denis does thoroughly what he undertakes, Mr. Ricketts stops short with the note, the suggestion, of what he would like to do.

In just this respect the difference between the French and English painters is very marked. The French prove that they have the knowledge to achieve the aim they set themselves, while the English always seem to bungle and blunder through somehow. M. Vuillard, for instance, paints, on a small canvas, a prostrate figure, Sur le Sofa, in a commonplace room, but gives you pleasure by the perfect tones. M. Vallotton takes a subject as simple, L'Armoire à Linge, a woman, with a lamp, on her knees in front of an open linen closet, but with an effect of light that gives it interest at once; though, to be honest, M. Vallotton was more individual and amusing in his wood-blocks of a few years ago. And the fine drawing makes up for the unpleasant color in M. Forain's Scènes d'Opéra and Danseuse, though M. Forain, too, is stronger in black-and-white. To turn to the English is to find them wrestling with much more ambitious schemes, which they have not the ability to carry out. Charles Shannon again shows a group of nudes, on a smaller scale than his big picture of last year, this time a stretch of blue, foam-flecked sea for background: Children of the Sea. Again, he seems oppressed with memories of Watts, and again his drawings suggest the hesitation fatal to beauty of the nude. Mr. Strang continues heroically and strives to unite the sentiment of Millet with the color and methods of the Old Masters, and make of the combination something entirely his own, but with such indifferent success that this year a Vintage by Victor Reynolds is a complete Strang, suggesting the ease with which the new convention can be borrowed, as personality in paint never can be.

Except from France comparatively little work comes from abroad. Germany is represented by G. Sauter, who lives in England. He does not build up elaborate compositions found only in the studio, he does not look through the eyes of the masters of other days and other lands; he is content to paint the things he sees for himself under existing conditions, the Frost and Mist, in the London streets, or the bunch of flowers in a glass; and with these, he sends one portrait, Joseph Pennell, Esq., full of character, enveloped in atmosphere, the best portrait in the exhibition. Spain is not so sensational as in the past. There is nothing by Anglada or Zuloaga. The Dutch make a poor showing, the Americans a very small one in the painting section.

In the graving section the international element is far more in evidence, a higher level of accomplishment is reached, there is greater vitality in individual examples. Technically, too, there is variety. As a consequence, you do not feel here, as you must nowadays in Paris, the decline of interest in the various forms of engraving. A few years ago, everybody was experimenting, often with the most remarkable results. The revival of lithography was full of promise. Illustration was at the height not only of popularity, but of accomplishment. Wonderful things were to be seen at the Champ-de-Mars. Dull or commonplace work was the exception. But the present is a bad moment for black and white. Illustration verges towards photography—in England, is all but swallowed up in it. The public is afraid of lithography; the collector, missing the plate-mark of the etching, suspects an inferior form of art; and when artists keep on working in this medium, it is largely for their own amusement. Yet a good exhibition of prints and drawings is as delightful and stimulating as ever. Here are wood engravings after Whistler. Vermeer, Da Vinci, and Irving Wiles by Henry Wolf. Here are lithographs by M. Belleroche, M. Veber, E. J. Sullivan, Mr. Hartrich, Mr. Jackson, all so different in method that they prove triumphantly the scope and possibilities of the stone. Here are etchings of French cathedrals by Joseph Pennell, and a series after Félicien Rops, printed in color, by M. Bertrand. And hung with all these prints are the pastels of M. Degas, M. Legrand, Mr. Muhrman, and M. Léandre; the water-colors of Anning Bell and M. Storm van s'Gravesande; and the illustrations in color of Miss Elizabeth Shippen Green.

In the sculpture, a special feature is made of the work of Dalou (the master of many sculptures, now at work in England) lent chiefly by South Kensington Museum and private owners. There are bronzes, marbles, terra-cottas, interesting, but too well known to be now described in detail. M. Rodin's Homme qui Marche dominates the central hal' large, full of life, and movement. It is seen for the first time in London, though Paris already knows it. He also sends his portrait bust, in marble, of George Bernard Shaw, shown last winter in bronze. The bronze was amusing, and full of character. It is not so successful in marble. But that great figure of The Man Who Walks seems to stride across the littleness of some of the other work—work of smaller men who have the courage to vie with Rodin, only to prove how ill-equipped they are for the contest. However, other good things are included: another part of M. Bartholomé's monument at Père-Lachaise; the portraits and studies of animals by Prince Troubetzkoy; little bronzes by Harry Wilson, who sends besides jewelry distinguished by unusual feeling for color and design; a casket and some silver fruit dishes come from Paul Cooper, another man with a sense of form and proportion, and the beauty of finish.

I have said enough to explain that the exhibition remains far the most interesting of contemporary work given in London. Whistler set the members on the right path, always, in his concern for the society, disinterested and practical, though he was always supposed to be the most egotistical and least practical of men. To avoid the parochial in art, that was his leading principle. Now that the English, or British, element grows stronger and the international weaker, one watches the fortunes of the international with more anxiety than in the years of its first triumphs.

N. N.

In the Beilage zur *Allgemeinen Zeitung* of January 21 is an interesting article by the late Prof. A. Furtwängler on the Arndt Collection of Antiquities, which has recently been presented to the Bavarian government. This article is of special interest as the last literary contribution of that great archæologist. The collection of Greek and Roman antiquities, which he describes, has been brought together with knowledge and taste by Dr. Paul Arndt. It consists of bronzes (both statuettes and utensils, such as fibulæ, cups, handles, etc.); vases (chiefly of Mycenæan and geometric fabrics, also a valuable lot of ancient Apulian or Messapian examples); gold work, colored glass, painted stuccos, and terra-cotta. The terra-cottas form the most valuable portion. Dr. Arndt has also made a valuable collection of forgeries, which are very instructive for the appreciation of the originals; they have not at present been exhibited, since no room could be found for them.

An interesting new theory has been advanced by Dr. Valerios Stais of the National Museum at Athens, concerning the small gold plaques which have been found in such numbers in the shaft graves at Mycenæ. It has generally been assumed that these gold ornaments were sewed on the garments of the dead. Dr. Stais, on the other hand, thinks that the dead were buried in wooden coffins, which have, of course, now totally disappeared; and that these coffins were covered with this gold. This would explain the fact that not only have a large number of small gold nails been found, with which these ornaments would be fastened to the coffin, but that in some of the plaques gold nails were still attached to the holes. According to this new theory the gold masks and diadems were similarly placed on the coffin. In connection with this idea it is interesting to compare the sarcophagi recently acquired by the Berlin Museum, on which the face of the deceased is represented as a mask which is frequently gilded.

In the series known as Künstler-Monographien, edited by H. Knackfuss (Leipzig: Velhagen & Klasing), Nos. 85 to 88 inclusive are now issued. The account of Angelico da Fiesole, with 124 pages and 109 illustrations, is by M. Wingenroth; Gesellschap, 86 pages, 92 illustrations, by M. Jordan; Perugino, 134 pages, 110 illustrations, by Fr. Knapp; and William Holman Hunt, 148 pages, 141 illustrations, by O. von Schleinitz.

In the Denkmäler der Malerei des Altertums (Bruckmannsche Verlag), the editor, Paul Herrmann, is furnishing a fine series of reproductions of ancient paintings. The set has now progressed to the fifth *Lieferung*. The last three contain reproductions of the paintings of the Casa dei Vettii, in Pompeii.

Among the exhibitions at the dealers' galleries in this city are paintings by "The Eight," at Macbeth's, till February 15; and prints and drawings by Dürer and Rembrandt, from the collection of Marsden J. Perry of Providence. at Keppel & Co.'s, February 20.

Joseph Grego, an English authority on prints, has died at the age of sixty-four. Among his books are "Thomas Rowlandson," "James Gilray," "A History of Dancing," and "A History of Parliamentary Elections."

BOOKS ON THE STEEL TRUST.

The American steel industry and the United States Steel Corporation continue to attract the attention of both popular writers and serious students of economics. "The United States Steel Corporation," by Abraham Berglund (The Columbia University Press; the Macmillan Co., agent), considers the history and present position of the "Steel Trust." It is the sort of detailed study that should be made of each of the great industrial combinations—study that should have preceded much of the generalizing in which economists have indulged. Mr. Berglund's important conclusions are: that the company has never had—and is not likely to have—more than a qualified monopoly of the steel trade; that its policy in respect to prices has been one of moderation, but would probably not remain so moderate if monopoly were ever assured; and that such control over markets as the organization may wield in the future will probably be exercised "in association with independent producers" through such agencies as pools or price agreements. He considers it doubtful if "the competitive strength of such a combination as the Steel Corporation is greater by virtue of mere size than that of some of the more important independent companies with only a fraction of its capital."

Dr. Julius Gutmann's monograph, "Ueber den amerikanischen Stahltrust" (Essen: G. D. Baedeker), covers the same ground as Mr. Berglund's study, but somewhat more briefly. The German investigator, like many of his kind, finds it easier to throw his raw materials—statistics, citations from documents, etc.—at his reader's head, than to digest them and present the results in something approaching tolerable literary form. He treats of some topics, such as the administrative organization of the Steel Corporation and its policy toward employees, which Mr. Berglund does not seriously consider; but his monograph has little to interest American students, except, perhaps, the concluding chapter, which compares the company with the German Steel Syndicate. Dr. Gutmann considers it doubtful whether, in point of economy and technical efficiency, the American organization enjoys any real superiority over the German; and shows that, however this may be, the condition of monopoly is more nearly reached in the German steel industry than in the American.

Herbert N. Casson's "Romance of Steel" (A. S. Barnes & Co.) is designed to be "a popular history of our greatest American industry." It may be of interest to the public, but is more likely to be highly valued by the various steel magnates for whose greater glory it seems to have been written. Mr. Casson dedicates the volume to the men "who have made the United States the foremost steel-making nation in the world"; expresses, in the preface, his personal obligation to some two score captains of industry and finance "for their courtesy and friendly coöperation"; and adorns the volumes with half-tone portraits of his collaborators. Its appropriate place seems to be among the "Fads and Fancies" of economic literature.

BOOKS OF THE WEEK.

Archer, William, and Granville Barker. Scheme and Estimates for a National Theatre. Duffield. $2.50.

Baldwin, James. Another Fairy Reader. American Book Co. 35 cents.

Bigelow, John. The Panama Canal and the Daughters of Danaus. The Baker & Taylor Co. 50 cents net.

Brown, Dr. John, Letters of. Edited by his son and D. W. Forrest. Macmillan Co.

Burnet, Margaretta. A Laboratory Manual of Zoölogy. American Book Co. 50 cents.

Carnegie Institution of Washington. Year Book, 1907. Published by the Institution.

Coleridge's Biographia Literaria. Edited by J. Shawcross. 2 vols. Henry Frowde.

Confessio Medici. Macmillan. $1.25 net.

Cook, Albert S., and Chauncey B. Tinker. Select Translations from Old English Prose. Boston: Ginn & Co. $1.25.

Delitzsch, Friedrich. Zur Weiterbildung. Lemcke & Buechner.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 20, 1908.

The Week.

Rear-Admiral Converse's official denial of the Reuterdahl charges about our navy is in many respects an admission of their truth. As a whole, he says, the critics suffer from "limited knowledge"—although it is an open secret that all of Mr. Reuterdahl's information came from navy officers with whom he has cruised, and from one in particular whose ability has more than once received Presidential commendation. The perfect battleship is impossible of achievement, is the Rear-Admiral's next point; hence the only question is whether our American ships have a minimum of errors or not. This he answers triumphantly by saying they have as few as the English vessels and the Japanese. This is a safe generalization, since the British and Japanese naval authorities are certain not to engage in a debate with Rear-Admiral Converse as to the merits of their respective ships. Rear-Admiral Converse admits that the Indiana and Kentucky classes are, as charged, too low forward for efficient fighting at sea in fairly heavy weather. In regard to the other ships, he takes direct issue with Mr. Reuterdahl. Evidently, from what the Rear-Admiral says, the matter of the exact place of the armor belt is open to argument. He holds that it should be in its right position, not when a ship is loaded for a cruise, but when a ship is about to go into action, stripped of everything superfluous, and with just enough coal to carry her through a battle. It makes no difference, of course, how she shall get home if, after the battle, she is miles from port with empty bunkers. So far as the Reuterdahl charges in regard to the inferior system of getting the ammunition into the turrets is concerned, the Rear-Admiral again admits that the critic's position is correct. The Navy Department is going to install at once on every battleship the two-stage ammunition hoist, "because it makes for safety." It is not entirely satisfactory, Admiral Converse says, but none the less we are going to spend a half million of dollars in placing it at once in all our vessels, those built and those building. This is a complete admission of the correctness of Mr. Reuterdahl's criticism of the Navy Department for not having done this years ago, following the example of all foreign navies. Finally, Rear-Admiral Converse leaves entirely aside, as perhaps he was in duty bound, the question of our inefficient bureau organization in the Navy Department.

Ohio is fully and fairly for Taft. It was thought that Senators Foraker and Dick would be able to elect six or eight delegates to Chicago, but the primaries last week seem to make it certain that the whole forty-six will be for Taft. What legal or even party ground Senator Foraker has for talking about a bolt and contesting delegations, we are unable to see. If he means simply to advertise that he is implacable, and that the bitter warfare in Ohio will render that State doubtful if Taft is nominated, his motives are intelligible, and the political effect of his action may be considerable. But that he has any substantial reason for denying that Ohio Republicans want Taft, few will believe.

In the current news about Presidential "possibilities," Judge Gray of Delaware appears conspicuously, not because of the importance of the body which endorsed him—merely the Democratic committee of a coal-mining Pennsylvania county—but because of what is said of the candidate:

> He has reconciled capital and labor in the bitterest industrial wars of modern times. Noteworthy among these reconciliations is that accomplished by the Anthracite Strike Commission, of which he was chairman. No peacemaker in the whole range of American history ranks with this man in the service he has rendered to his country. . . . To his initiative and force must be attributed the reform of the child-labor laws in Pennsylvania, and in a large measure the success of the child-labor movement throughout the country.

The praise is deserved. If the Democratic party is looking for a man well-fitted for the Presidency, George Gray is to be carefully considered. His experience as Attorney-General of his State, as United States Senator, as representative of this country on the Peace Commission of 1898, the Joint High Commission, and the Hague Court, and as circuit judge, includes a rare combination of executive, legislative, and judicial duties. Against him are cited, so far as we know, only two objections: that Judge Gray belonged to the gold wing of the party twelve years ago, and that his State has but three electoral votes. Ex-Attorney-General Harmon may likewise be put forward as the man who undertook the First Federal Trust prosecutions, and who, moreover, when summoned by President Roosevelt as a special adviser, recommended the prosecution for illegal rebating of a member of the Republican Cabinet, Paul Morton. It was not Mr. Harmon's fault that the President himself overruled the proposal and lauded Mr. Morton to the skies on his retirement from office. Johnson of Minnesota has behind him two highly successful terms as Governor. These men are only typical of many less "available" Democrats who have been faithful to public trusts small and great. If the Democratic nomination were to be disposed of solely in accordance with the actual careers of the aspirants, Bryan, instead of overtopping all others, would stand near the foot of the list. Mr. Bryan, it is true, has not had a chance. Aside from two terms in Congress, and the colonelcy of a volunteer regiment, he has been defeated for every office he ever sought.

There is one logical answer, and only one, to the Democratic cry that the present depression has controverted the stock argument that Republican ascendency is an assurance of prosperity. It remained for ex-Gov. Black to give that answer: This is not a period of Republican ascendency. "Nature works best when most encouraged," said Mr. Black before the Home Market Club at Boston last week:

> She resumed her industrious career at the beginning of McKinley's Administration, and followed it incessantly until the culmination last October of those dangerous, socialistic, un-American doctrines which took away her courage and started her upon a course of wandering and hesitation. These doctrines have been promulgated under the cloak of a Republican name. But they are not Republican.

Of course not. The definition of "Republican" is something, or somebody, that makes us prosperous and happy. Therefore, anybody or anything that does not make us prosperous and happy cannot possibly be Republican. As for the cloak of a Republican name, Mr. Black cannot evade some responsibility for throwing it about the Roosevelt shoulders. He was the man chosen four years ago to nominate Roosevelt for the Presidency, and he did it in a speech as epigrammatic as that of last week, characterizing his candidate finally as "the highest living type of the youth, the vigor, and the promise of a great country and a great age."

Disregarding the recommendation of the President, as of the Civil Service Commission and of two directors of the Census (Carroll D. Wright and Robert P. Porter), the House Committee on the Census has decided that the employees for taking the Thirteenth Census shall not be appointed under civil service rules. There will be examinations, to be sure, but these will be non-competitive. For all we know, at present, they may be extremely strict, though past experience does not make this appear at all likely. But even the assurance that they will be made harder than any of the ordinary civil-service tests would not remove the objections to the policy of the Crumpacker bill. The securing of a reasonable degree of fitness in public servants is only one of the objects of civil service reform. The main consideration is that even if the census clerks and enumerators have to be trained, their places are subject to the scrambling and wire-pulling of Senators and Representatives, prodded on by ambitious constituents. "The Lord knows I have troubles enough of my own without becoming a lobbyist for office-seekers in Washington," is the complaint of one Congressman who opposes the spoils provisions of this year's census bill. We trust that whatever be the law, the Census Office will secure a force that can do the work with reasonable efficiency and economy. But to subject the office, as the favored bill does, to the mongering of appointments for favorable votes on appropriations has no reasonable defence.

Valerian Gribayedoff, who is called "the originator of newspaper illustration in New York," died in Paris last week. He was not the first to hit upon the idea of telling stories by pictures. "Our special artist on the spot" followed the armies of the Civil War. But whether or not journalistic tradition was then more dignified, the mechanical difficulties of reproduction subjected the artist's work to a sort of censorship which at least gave it a certain amount of deliberation and responsibility. It took time and money to make even the poorest wood-cut. The development of photo-engraving gave the real stimulus to illustrated daily journalism. It takes little longer nowadays to make a zinc etching from the artist's line drawing than to put the reporter's "copy" into type. It is recalled now that Mr. Gribayedoff twenty-five years ago conceived the idea of embellishing his news articles by pen-and-ink likenesses of the persons concerned. After this, it was natural for papers to send draughtsmen on assignments with the reporters. Then followed the newspaper photographer, and the obtaining of pictures became almost as important a part of a certain sort of journalism as the obtaining of news. No critic of illustrated journalism will deny the essential value of pictures as an aid to the understanding of description and narration which deal with practical matters. The weeklies have for generations maintained on the whole a high standard in the picturing of current events. But with the daily, even at its best, the case has been different. The reporter who arrives half an hour after the riot or the bomb explosion secures a reasonably accurate account without difficulty; the sketch artist is relatively and the photographer absolutely helpless. News can be telegraphed or telephoned; pictures cannot. Hence the first pictures of distant happenings must be made in the newspaper offices and the legend "drawn from telegraphic descriptions"—which might as well be "drawn from our inner consciousness"—becomes familiar. The reporter can, without spoiling his story, leave out some of the details which he does not know; the news-picture is valueless unless specific. So the details must come from somewhere. In a word, the temptation to "fake" pictures is considerably stronger than the temptation to "fake" news itself, and it is yielded to with proportionately greater frequency by those papers which make the pretence that their pictorial chronicle is anything like as complete as their news service. Thus the innovation for which Mr. Gribayedoff receives credit has by no means been an unmixed advantage to daily journalism.

"How," said a prominent foreigner in a New York club on Saturday, "would you Americans feel if, ten years after a Chinese raid on Washington, you heard of a Peking auction sale at which were offered many of the treasures of the White House and the finest residences of your capital?" The question was called forth by the auction here this week of what is described as "antique and modern Chinese porcelains, enamels, brasses, bronzes, . . . ancient weapons, a great number of Imperial and Mandarin robes, original rolls of rich silk and gold brocades *which were made for the Imperial household;* beautiful embroideries and palace hangings, etc., etc., all collected prior to and after the siege of the legations in Peking in 1900 by the widow of the American Minister to China during the Boxer rebellion." Let us at once disclaim the slightest intention of insinuating that the present owner, or her personal representatives or relatives, had any hand in the looting of the Imperial Palace which went on in Peking, in the name of humanity and Christianity and civilization. We have every reason to believe the statement in the New York *Sun* that this collection is "not the slow aggregation of years of indulgence in the collector's hobby, but represents the timely purchases of a practical woman with a taste for the beautiful, who found herself at an unlooked-for emergency in an exceptionally favorable position to obtain objects in which all the world is interested." As we understand it, after the relief of the legations and the solemn march through the Imperial Palace, Peking abounded in loot. The vandals wore the uniforms of every Western nation represented in the column which marched up from Tientsin; and beyond doubt many Boxers and Chinese criminals, patterning after the invaders, helped to carry on the plundering. Mrs. E. H. Conger's dealing was either directly with the thieves themselves or with the receivers of stolen goods. We trust, of course, that no one will accuse us of any sympathy for the heathen who were robbed. What we are particularly concerned with just now is the honor of our own country, and we confess to a certain feeling—old-fashioned, if you please—for the reputation and standing of our diplomatic corps. Is there no generous and wealthy American ready to rival J. Pierpont Morgan in returning the famous Cope of Ascoli, as soon as he became aware that he was the possessor of stolen goods? If there is, we can think of no finer opportunity to demonstrate the innate courtliness and honesty of the American people, than for him to acquire the stolen property of the Imperial family of China, and ship it back with the compliments of the whole people.

The uncertainty as to the future management of the Metropolitan Opera House has at last been removed by the official announcement of the board of directors. It is, on the whole, a most encouraging document. Signor Gatti-Casazza, who has been the director of Italy's best opera house, the Scala of Milan, for nearly a decade, is to be the general manager, and he will bring with him Signor Toscanini, whom many consider an even greater orchestral conductor than Campanini. Under their supervision, we shall doubtless have performances of Italian operas that Italy cannot duplicate. The cause of German and French opera will be safeguarded by the administrative manager, Mr. Dippel, and his chief conductor, Mr. Mahler, who may be depended upon not to neglect their opportunity to introduce much-needed reforms, especially in the matter of staging operas, new and old. Here, where the outgoing manager was expected to be strongest, he gave, with some exceptions, the least satisfactory results. Mr. Conried will be most favorably remembered in connection with the successful production of important novelties like "Parsifal," "Hänsel and Gretel," and "Madama Butterfly." One reads with gratification that managers' benefit performances, heretofore the cause of much discord, will be done away with, and that hereafter the Metropolitan Opera House will be administered without any thought of money return to the owners, since all surpluses will be applied to the advancement of operatic art.

A brief but extraordinary dispatch from Lisbon shows to what an unsuspected extent rancorous hatred of the fallen absolutist régime had penetrated the people. Persons, we are told, have been calling at the home of one of King Carlos's assassins, who was cut down by the police, and have been leaving money for the support of his children. A prominent merchant has opened a subscription for their benefit, and has himself contributed a large sum. This dispatch is only confirmatory of previous reports concerning the comparative indifference with which the tragic events of two weeks ago were received by the inhabitants of Lisbon. While foreign rulers and parliaments were expressing their horror at the fate of Dom Carlos, the Portuguese people have virtually been declaring that the dead King deserved his fate. The predicted reaction in favor of the monarchy has not come; of that we may be sure when a department-store owner regards it as a good advertisement to contribute one thousand dollars for the support of a regicide's family. In other words, the Portuguese crown has not as yet weathered the crisis. Our cabled information tells of continued activity on the part of Republican leaders, and it is hardly to be supposed that they will be content with a restoration of the old dual party control whose glaring defects h brought about the dictatorship. A decent regard for the opinions of mankind may counsel a temporary cessation of open warfare against the young King; but conditions are not particularly . assuring.

Conditions in Macedonia are disheartening. From St. Petersburg comes word that Germany's pro-Turkish sympathies, never strongly repressed, are now openly avowed, to the destruction of all hope of effective coercion by the European Concert. For more than a year the Powers have been pressing the Porte for a series of necessary judicial reforms in Macedonia, involving the supervision of the Turkish courts by European inspectors. Germany now abandons the allies, and suggests instead the adoption of the Sultan's counter-proposals, which are tantamount to no reform at all. Nor is Austria-Hungary zealously bent on the execution of even such reforms as have been sanctioned, thanks to various railway concessions granted by the Porte. The Balkan Committee at London has submitted to the Powers a note reviewing European action in Macedonia to the beginning of the present year. The note tells the well-known story:

> The effect of the reform scheme (the Mürzsteg programme of 1903) on Macedonia itself has been disastrous in the extreme . . . In a country of about a million and a half inhabitants, over ten thousand people have been murdered since 1903. Nationalist forces from outside Macedonia terrorize villages in order to effect political conversions, while the Turkish troops raid indiscriminately. There is a vast stream of emigration . . . so that in central Macedonia in many villages there are hardly any able-bodied males left, but only women and children.

The remedy suggested by the Balkan Committee is to make the foreign *gendarmerie* really effective:

> It is universally recognized that but for the opposition of certain Powers the Concert could secure for the Financial Commission and the *gendarmerie* officers a real executive control. If the European officers took over the command of the troops, and were responsible to the European Commission only, they could speedily suppress the bands and restore security for life and property which are the immediate practical necessities.

But the suppression of the Greek, Servian, and Bulgarian bands would mean more than a response to the call of immediate necessity; it would facilitate an ultimate solution of the difficult Macedonian problem. As it is, inter-racial violence in the Balkans only plays into the hands of Turkey and those Powers which are now her friends. Were the Macedonians to appear before the world as the helpless victims of Turkish misrule, no government would be bold enough to refuse intervention. But a Macedonia rent by warring Christian factions enables the chancelleries to shift the blame and give attention to their own cynical policies.

George Meredith, as he looks back over a stretch of eighty years, can trace a record of many things accomplished, but also of many things left undone. He has failed to beat the loud tom-tom of imperial duty and Gatling guns; he has not attempted to combine the rôle of the acrobatic jester with that of the social prophet; he has written nothing about the relations of the sexes on the planet Mars; he has created no single universal character like the famous friend of Dr. Watson; he has shrunk from the cosmic problems that attract Hall Caine. His photograph has appeared only rarely in the illustrated magazines. We do not know how many centuries old is the rural cottage he lives in. We have seen no picture of his library, his automobile, his dog, of his man-servant, or of his maid-servant. We are not even sure that he employs both a man-servant and a maid-servant. He has tried to deal with the subject of modern love, for instance; but his total lack of modernity appears in his complete ignorance of the science and art of press-agency. He has written a large number of books treating of men and women engaged in struggle with their own natures and Fate. But his characters, as Jack London would say, are deficient in "red blood," and his style, as R. H. Davis would say, lacks "go." It is surprising, therefore, that Mr. Meredith should have received an address signed by a great many well-known men and women thanking him for the example he has set "before the world of lofty ideals embodied not only in your books but in your life." Yet the "world" principally knows Mr. Meredith as the man who advocated ten-year marriages. But that is a manifestation of the Comic Spirit.

On the basis of Paul Bourget's novel, "Un Divorce," the author and André Cury have written a play which has been produced in Paris with notable success. A recent issue of *Figaro* contains, in three columns, the climactic scene, which has carried away Parisian audiences by its eloquence and "high impartiality." But the scene appeals on more formal and purely literary grounds. It has long speeches, and the two men who carry on the dialogue are well-mannered enough not to interrupt each other. This is in strong contrast with a printed page of Pinero, of Henry Arthur Jones, or of Clyde Fitch. The plays of these men, especially of Pinero and of Fitch, supposedly aim at the nearest approach to the "natural" mode of speech. There are pages and pages of Pinero which will show a total of forty or fifty words of dialogue, all in speeches of lines, half-lines, and mere interjections. Now, asthmatic dialogue of this kind is far from being "natural." The snappy give and take that makes up the burden of our stage speech occurs with comparative rarity in actual talk, and that only in our lighter moments. In real life, when we tell our friends of our latest misfortune, our friends sit quietly by and interrupt only with a word of sympathy now and then. In real life we don't condense the wisdom of the world into glittering half-sentences. On the contrary, we generally stumble along in a very uneconomical way, using too many words, forgetting essential statements, and going back for them, spreading the butter of our thought very thin on the bread of our words, and often letting it fall to the floor wrong side down. We are so prosy that the "neat" dialogue of the well-built modern play has the right to call itself everything but natural. The reasons for the crisply-written play are, of course, obvious. In the first place, it is a reaction against the long tirades and monologues of the classic and the "closet" drama. Instead of Chorus coming out and acquainting the audience with the necessary preliminary facts of the story to be enacted, William the butler and Marie the housemaid appear. But we have gone much further than was necessary in reaction against the dialogue of lofty and lengthy heroics. Moreover, the long speech requires actors who can speak well, and who can listen well—and neither accomplishment stares us exactly in the face from stages of our theatres. Indeed, the enlivening effect of the half-line and quarter-line dialogue is largely akin to the physical thrill that is evoked by a rapid use of the slap-stick.

CHANCE FOR AMERICAN ENTERPRISE.

Necessity is, after all, the best spur; and it may well be that the present necessities of American commerce and manufacture will arouse an inventiveness and enterprise which the fat years have left dormant. We know that it was so after the panic of 1893, and during the years of following depression. American business men then lifted up their eyes and looked to foreign markets as they had not done for a generation. With the home demand greatly curtailed, sales abroad were sought and found. We cannot already have forgotten the "American Peril," before which Europe was shuddering in those days—the invasion, namely, of European markets by American goods. There are some signs that the existing exigencies in this country are about to lead to similar developments. Plainly, the opportunity is great.

We do not say that there will be at once an enormous expansion of our manufactured exports, such as we saw ten and twelve years ago. History repeats itself, but always with a difference. Europe may be better able to supply her own wants than she was in 1897. The chance to find customers in South America and Asia may not be so good. Our business rivals have had time, during our neglect, strongly to entrench themselves. Still, like causes are at work, and will produce like effects. Our consuls are reported to be overwhelmed by letters of inquiry from American manufacturers. Information is eagerly asked for respecting prices and lines of trade and possible openings. With the home market glutted and the consumptive power of the country greatly cut down for the moment, American concerns, anxious to keep their factories going and their men employed, are studying the possibilities of foreign commerce with unwonted zeal.

If home-keeping youths have ever homely wits, so have home-keeping manufacturers. A large and apparently secure domestic market tempts them to take their ease. Why seek to improve processes or reduce the cost of production when everything that they can turn out is taken at top prices? It was this spirit that the German commissioners at the St. Louis Fair remarked upon. They looked about for indications of the extraordinary American inventiveness of which they had heard, but did not find large evidence of it; and they reported that the advantage of our manufacturers lay chiefly in abundant and cheap natural resources. In the application of trained mind to scientific manufacture, they thought that Germany had nothing to fear from the United States. But poverty and struggle are great quickeners; and it may be that we are to see a new display of American organizing ability, and fertility of resource, forced into activity by the pressure of hard times.

National action in such matters is simply the combined efforts of individual citizens. And wherever we look about us, we see what men are doing in the face of diminished trade and narrowed outlook. They are economizing. They are setting their wits to work to devise new ways of adding to income, or making the lessened income go further. They give their minds to new methods of doing old things. But the same motives operate in large business and manufacture. Waste is more carefully guarded against. Attention is directed to the problem of making labor more efficient and machinery more varied and exact. It is clear that the times offer a new and rich premium to every form of invention and intelligent energy. For our part, we cannot doubt that the result will be to give American manufacture a wonderful impetus.

Difficulties, of course, lie in the way. But obstacles are only an inspiriting challenge to a true man. To remove them gives added zest to achievement. A conquerable difficulty is no real difficulty. And among the removable obstacles in the way of such a development of American industry as we refer to is one upon which practically everybody is now agreed, yet which almost nobody proposes immediately to get out of the way. We mean, naturally, the Dingley tariff. Its uselessness in warding off panics, or "making work," or even in providing sufficient revenue, shows that it is a mere cumberer of the ground in all those respects, while in addition it now lays a positive handicap upon the American manufacturer striving to recoup himself abroad for slackening demand at home. It is an old story, but it will be forced with fresh point upon our mill-owners and exporters in the months before them. They will feel more acutely than ever the burden of needless taxes upon their raw materials. With their machinery and other supplies costing them more, too, in consequence of protective duties, they will have to exert all their skill and force to make head against their more fortunate foreign competitors. There has to be reckoned in, also, that spirit of commercial hostility which high and discriminating tariffs provoke. The absence of it, because of the policy of free trade, Lord Cromer recently gave as one of the chief commercial assets of England. We must now go insinuatingly to ask people to buy of us whose own goods we have done our best to keep wholly out of our markets. Dingleyism thus stands as an undoubted hindrance to that expansion of our trade abroad which is so clearly indicated as the remedy for our temporary trouble at home. And one of the indirect blessings of these days of adversity will be to accumulate added indignation at a tariff system which, in an emergency like the present, lays a fettering hand upon American enterprise and checks national recuperation.

THE ALDRICH CURRENCY BILL.

With Senator Aldrich's introduction of his bill for an emergency banknote currency—based on collateral of State, municipal, or railway bonds, taxed at the rate of 6 per cent. per annum, and limited in aggregate amount to $500,000,000—the first of the after-panic expedients in currency legislation is before Congress. We believe that the Aldrich bill ought not to become a law: first, because it is a makeshift, constructed in the confusion of mind and confusion of tongues which always follow financial panic; and secondly, because the measure embodies vicious principles which are more likely to aggravate than to allay our periodical financial crises, and which would probably stand in the way, hereafter, of sober constructive legislation.

Four arguments are advanced for the bill. First, some law for emergency currency must be enacted at once, because we may be soon confronted with another panic, in which, Senator Aldrich reminds us, we might have no available Treasury surplus as in 1907, no United States bonds free for use as a basis of circulation, no facilities for importing foreign gold, and no bankers of sufficient ability to cope with the crisis. Second, something must be done to restore the people's confidence. Third, the demand for an issue of government legal tenders must be stopped by an alternative expedient. Fourth—and in this we cite not Senator Aldrich's speech, but the current talk of Washington—the dominant party must not confess inability to meet this question before going into a Presidential election.

None of these arguments seems to us well founded. Financial panics, with the peculiar phenomena of last October, never follow in quick succession. They are, and always have been, separated by intervals of fifteen or twenty years; and for this separation there is the cogent reason that the conditions which make them possible occur only at the climax of a prolonged and violent strain on credit, the result and the end of an era of prosperity. Therefore the need for legislation is probably less to-day than at any time in more than a dozen years. Moreover, when the crisis does arrive, facilities for importing gold will be present, as they invariably have been in the past; so will competent bankers. A Treasury surplus is no doubt an accident—we had none in 1893—but if a supply of government bonds is a serious matter, the Panama Canal may be depended on to take care of it. "Confidence," in so far as that means abandonment of money-hoarding and of general runs on banks, is already restored; that psychological side of the recent panic is no menace whatever for years to come. The demand for legal-tender issues is an impotent demand, as Senator Aldrich knows: Congress would not have yielded to it, even at the height of panic. The plea for "doing something," before the party confronts the electorate, is the most mischievous of arguments; it is precisely this motive which led to the numerous silver-coinage compromises in a discreditable chapter of our economic history. Every one of those makeshifts made the trouble worse, encouraged unsound financial methods, and put off still further intelligent action on our currency standard. The Aldrich bill, if enacted, would, we are convinced, have the same result.

Objections, based on the fact that currency legislation is not imperatively necessary to-day, are not of themselves conclusive. They would have no force if invoked against a proper measure. But the positive objections to the bill are conclusive. Its emergency provisions, to begin with, would, in all probability, be used in advance of a real emergency. They would almost certainly have been used in advance of 1907—an assertion for which the Treasury's own operations with the banks, in September, 1902, and September, 1906, are proof. On each of those occasions the Treasury yielded to the pressure of banks to "put more money into circulation"; the banks themselves had already yielded to the pressure of speculative borrowers. On both occasions relief was solicited primarily to sustain a rash Stock Exchange speculation. To avert the forced liquidation of the speculators, the Treasury stretched the law beyond all precedent: its actual argument was that call money on the Wall Street market was lending at 75 per cent. or higher. Does any one suppose that, in a similar situation, similar pressure would not be applied, or that a 6 per cent. tax on the new bank circulation would stand in the way of it? Yet the result of such premature use of the emergency expedient would be to stimulate (as it did in 1902 and 1906) the very inflation of credit which was weakening financial institutions.

If the Aldrich bill had not this grave defect, it would still be objectionable, in that it would establish a false and vicious principle. The virtue of asset currency lies in the fact that the trade bills which stand behind it mature in due season, and, through their maturity, extinguish automatically the bank-notes based upon them. In the main, the Clearing House loan certificate possesses the same virtue. But the collateral prescribed by the Aldrich bill is permanent in its nature.

That use of State, municipal, and railway bonds as a basis for this currency would virtually discriminate against sections of the country where the supply of such securities is small, and in favor of sections where it is abundant, is a valid objection to the bill. Senator Aldrich endeavors to meet this argument by contending that many portions of the country need money for local improvements. He adds:

> Nothing would bring the benefits of the national banking system more closely to the attention of the great masses of the people than would the willingness on the part of the banks to give value and stability to local securities by their purchase as a basis for security of note circulation.

For ourselves, we should say that nothing would better prove the tendencies of the Aldrich bill, as a possible inflation measure, than this frank confession by its author of its value as a handmaid of financial promotion and of the market for securities.

NATIONAL DECLINE.

English politicians who favor huge navies, conscription, aggressive foreign policies, and other forms of "imperial thinking," have learned to use the word "decadence" with considerable effect. To build twice as many Dreadnoughts as Germany is to be faithful to the trust of empire; to hesitate is to show signs of imperial decadence. And Englishmen, to a greater or less extent, seem to be actually nervous on the subject. The manifold difficulties of holding together so vast a realm must, of course, increase with time. But behind the vexations of the moment is something like a superstitious fear. "All nations must grow old and fall," runs this unexpressed apprehension. "Rome grew old and fell. England is as old as Rome was when it fell. Is the Empire, then, about to fall?" And when the London *Times* assures them that such will be really the case unless something that Germany doesn't like is done in Persia or Morocco or somewhere, Englishmen feel themselves put on their mettle, like a middle-aged gentleman who is impelled to show that he can hold his own with the youngest of them.

Arthur Balfour chose "Decadence" for the subject of his Henry Sidgwick Memorial lecture, recently delivered at Cambridge University. Mr. Balfour, the lecturer, ventured to take a far more philosophic view of his subject than Mr. Balfour, the British Prime Minister, would have allowed himself to do. He was inclined to regard national decadence with equanimity, or at least with the resignation which the philosopher adopts in the face of an unalterable law of nature. Weismann had advanced the theory that the presence of old age and what we call nátural death in the higher organisms, as distinguished from the lowest forms of living protoplasm, is accounted for by the fact that the death of the individual is useful to the race, and that natural selection had therefore, "in all but the very lowest species, exterminated the potentially immortal." Mr. Balfour was inclined to believe that, in a modified form, the principle would hold with regard to nations. The decay of a particular political group might redound to the benefit of civilization as a whole, and decadence would thus become a necessary condition of progress.

Mr. Balfour very properly takes into account the differences between decay in individuals and in nations. The difference, to our mind, is so far-reaching as almost to amount to contradistinction. Nations decay chiefly in the sense that time brings them face to face with competitors who outdistance them. The Roman Empire seemed ready to go to pieces in the third century of our era. It was given two hundred years of new life by a series of able Emperors. The Germanic tribes were not then strong enough to prevent the patient's recovery, and the Roman Empire managed to counteract the process of decadence till 476 A. D. Had the Germanic tribes by that time failed to develop their full strength, Rome's decadence might have continued indefinitely. It is a question whether the Spanish people of to-day is really worse off, man for man, than under Charles V.; only the other nations have outstripped it. It is quite certain that France of to-day is as inherently healthy as it was forty years ago. It is only the rapid rise of a German Empire that has supplied the occasion for talk about French decadence. And if a liberalized and democratic Russia, twenty years from now, should seize for a time the leadership of Europe, it would not mean necessarily that Germany had started on the downward path. To fall from first to second place in a foot race is not synonymous with getting farther away from the finish line. And that is why the Latins so obstinately refuse to let themselves be labelled decadents. In the absence of actual retrogression, there is always life, and where there is life there is hope.

What renders much of the present talk about national decadence particularly empty is the unmistakable, growing solidarity of the world. According to the primitive theory of commerce, still held in the Congo, perhaps, and at Washington, one of two parties to a bargain was bound to be the victim. Economists have now taught us that free exchange will benefit buyer and seller alike. One of the two may get the better of the bargain, as we call it, but the whole process is based on the principle that both get a certain amount of good out of it. It is largely the same with modern historical evolution. Nations may compete, but even when one nation gets so decidedly the better of the other as Germany did of France in 1870, good may accrue to both. Germany attained the hegemony in Europe, but France, out of the ashes of defeat, built up a more complete democracy than she had had since the Revolution. No nation can progress without drawing other nations along with her. Our own unparalleled material development does not imply retrogression for Europe. On the contrary, Great Britain, Ireland, northern Europe, Italy, in giving us their surplus population, have themselves profited tremendously. By commerce, by the telegraph and the cable, by the triumphs of science which knows no country, by such international movements as that for disarmament, it is being made less and less possible for one nation to sicken and decay without inflicting hurt beyond its boundaries, or to move forward towards a healthier life without impelling others in the same direction.

MISQUOTATIONS.

Attention has lately been drawn to the subject of misquotation by some correspondents of an English periodical, the *Observer*, who have been pointing out holes in the coat of Sir Arthur Conan Doyle. That gentleman recently dropped into a volume of literary criticisms, and the critics fell upon the criticism. In particular, they have made merry over a looseness in citation unworthy of Sherlock Holmes. They have proved that Sir Arthur misquoted Dryden and Coleridge and, most unpardonably of all in a critic, Matthew Arnold.

Such discoveries are annoying to any author, but not necessarily fatal. To Emerson's saying about the invincible tendency of writers to quote, might be added a rider touching the ever-present peril of misquoting. Its causes are many, and not always discreditable. The true force and aptness of quotation come from its spontaneity. The allusion, the reminder, the parallel, pop easily into the mind. This is especially the case in conversation. Hence we should naturally mistrust a man who was always minutely accurate in a quotation, always letter-perfect in his citation of poet or orator. That would look as if he were not really so familiar with his matter as he pretends to be; that he had painfully got it up for the occasion, and were discharging a recent load upon his memory, instead of letting reminiscence well up easily from the depths. In the give and take of speech we look for quotation that sits lightly upon the bosom's throne; and that kind we are not likely to get in invulnerable form.

There are, too, the misquotations which have been so long consecrated by usage that one hesitates to set them right. The crime of posing as a pedant is as black as that of misquoting. So the ordinarily prudent man will not break in to correct the common "fresh *fields* and pastures new." He knows how it ought to read, but such knowledge is often best hugged in silence. Winter will soon be again "lingering in the lap of spring," and no hard-hearted man, we hope, will summon Goldsmith from the grave to rebuke the inaccuracy, and to insist rudely that "winter lingering, chills the lap of May." In such matters we cannot expect impeccability. One who never misquoted would be as suspect as that Frenchman whom Marshal Marmont describes as approaching the guards at the Paris barrier in the Revolution. The man answered every question, and produced every required document, only to throw his examiner into a rage. "Canaille, tu es trop en règle. Je t'arrête!"

The case is different, we admit, with deliberate writing. In that, the rule to verify your quotations ought certainly to be followed. Yet here, again, fallible memory or over-confidence often plays sad tricks. De Quincey was doubtless in this respect a sinner above most that dwell in the literary Jerusalem. He frequently wrote, as he warned his readers, away from books, but even so some of his writings on poets are starred with misquotations that seem unforgivable. Wordsworth wrote:

> She gave me eyes, she gave me ears.

In De Quincey this became:

> She gave me hopes, she gave me fears.

But probably the Opium Eater's worst "howler" was in pretending to quote "the exquisite language of Shakespeare" to the effect:

> To write no wrinkle with his antique hand.

This was presumably his shot at Byron's

> Time writes no wrinkle on thine azure brow.

Such blunders are amusing, but do not constitute the unpardonable sin. The reader knows what is meant. He may even enjoy a double share of the "laughter of the intellect" in consequence of such lapses. They are, in a sense, only samples of literary embroidery, badly made and hung awry. More severe must be the judgment on men who make quotations to prove a case, or maintain a thesis, yet who, through either carelessness or ignorance, mistake their authorities or garble them. For such faults, the historic exposure of Edmund Gosse by Churton Collins was salutary, though savage. Even deliberate and malignant misquotation was viewed philosophically by Horace Walpole, who declared that a foe who misquotes you ought to be a welcome antagonist: he is so humble as to confess, when he censures what you have not said, that he cannot confute what you have said; and he is so kind as to furnish you with an opportunity of proving him a liar. But such cases stand in a class apart. The run of misquotations must be thought more venial. The charm of quotation is that it is from memory, but memory in us moderns seems increasingly treacherous. So there is nothing for the detected misquoter but to throw himself upon the mercy of his partners in distress, and ask them to be to his faults in that line a little blind.

WASTEFUL REPETITION IN THE STUDY OF ENGLISH TEXTS.

In a letter to the editor of the *Nation*, October 24, 1907, I suggested that the present ineffective teaching of English in our preparatory schools is due, not to the number or nature of the required books, but to the methods of teaching. Since that time, a careful inquiry among some three hundred freshmen has convinced me that the suggestion is pertinent. I have found among them a genuine interest in the books themselves which speaks for the power of the classics to rise above even the present mode of teaching them; and I have gained surprising evidence concerning certain weaknesses in the methods of instruction which seems to me to demand serious consideration. In general these weaknesses are well known; one in particular, however, seems to have been little commented upon—the wasteful repetition in the study of English texts.

Among the 320 freshmen whom I have questioned, or received reports from through other instructors, I have found many who have read in the schools one or all of the required books, two, three, and even four times. The simplest form of this repetition is the review of some or all of the reading at the end of the senior year, as a final preparation for the college or regents' examinations. In some cases, of course, the review was made by the student herself, outside of school, and with these we have no concern. In many cases, however, special preparation time was allowed for rereading the books, and often class periods were given to review. Of one large city high school I find it reported: "Every book which we studied was read twice the same year, the first time very carefully, and the second time simply reviewed." Upon inquiry I find "very carefully" to mean making abstracts, lesson by lesson; "simply reviewed" to consist in reading the abstracts or the book itself at the end of the year in preparation for a review discussion covering perhaps two days for each book. Of more than one school I find it recorded that a whole term or more of the final year was given to doing over again work already done in the English texts.

Going from these general reviews to the repetition of the special books of the General Reading list, I find "Ivanhoe," "Lady of the Lake," and "Merchant of Venice" the most abused of college texts, though the "Vision of Sir Launfal," "Silas Marner," and the "Sir Roger de Coverley Papers" are close seconds. The favorite form of repetition here seems to be the reading of one or another of these books as a reading lesson in the final year of the grammar school, with stress only on the story, and the study of the same book the next year in the high school. In one instance "Lady of the Lake" was studied as a "grammar exercise" in the lower school, and later as "a piece of literature" in the high school. In other schools, where "English" and "English Reading" are unhappily divided, the same book was studied in the two courses at different times and in different grades. Elocution and English have sometimes played this double part. The climax is reached, however, when "Ivanhoe" goes on record as having been studied in two different grades, and "still again"—I quote a student's written words —"at the end of the senior year. The last time it was a quick reading, with an outline and abstracts, as a final review"!

The Careful Study list shows, on the whole, a cleaner page than the General Reading; the Careful Study books are, as a rule, left for the final years. But even here there are cases of doubling that seem unnecessary, if not inexcusable. "Julius Cæsar" has many times been studied in two grades; the change in the texts for 1906 seems in most cases responsible for this, as for some of the other instances of doubling to which I have referred, "Macbeth," Burke's "Speech on Conciliation," Macaulay's "Life of Johnson" have been all read twice, sometimes in consecutive years. Several times Milton's Minor Poems have been tampered with in the second year of the high school, and have then been taken up for careful study in the final year. In one school the "Essay on Burns," "Essay on Addison," and "Life of Johnson" have been read three times in succession, the first time as an outside assignment, the second time for the purpose of making an analysis of the whole essay, the third time "slowly"—I quote again—"condensing each paragraph into a topic sentence. The 'Essay on Burns' we read a fourth time, considering Carlyle's opinions of life and writing, Burns as a writer and as a man, and Carlyle's style as found in the essay."

But the most flagrant instance of the kind which I have met with is that recorded of a girl's high school in one of our largest Eastern cities. I could not credit the report until I had in my own hands the note-books containing the daily assignments for the final three years of the course, no one of which was a repeated year. From these note-books I make the following lists of the texts as read, numbering each as it is repeated:

1904.

Essay on Addison, Nov. 9.

2 Minor Poems, May 6.
2 Sir Roger de Coverley, May 13.
4 Macbeth, May 29.
4 Life of Goldsmith, June 3.

The list is misleading in one respect: time given to Pancoast's and Stopford Brooke's histories of literature, to the rhetorics of Genung, Hill, and Abbott, must be read between the dates. But for our present purpose it is not misleading. The repetition is plain to see; and no matter how little time is given each year to each book, the continual repeating of the same text is deadening. The bloom is soon gone from the handled peach; the zest of discovery is lacking in the forced return to the familiar. Such doubling and tripling and quadrupling is sheer waste. At this point I find myself near yielding to Prof. F. B. Gummere's contention that the teaching of English in the schools is "overdone." But I fortify myself with the testimony of an exceptionally well prepared student, who writes:

> I think in all my high-school course no book was studied more than once. The first study seemed, to me at least, to be very thorough, and each book now stands out clearly in my memory.

Such cases as these which I have mentioned are not in the majority; they do not indicate wholesale corruption in our English practices. But they are significant—making all due allowance for possible freshman inaccuracies—of the extremes to which the schools have let themselves be driven by the present system of English requirements. And they are sufficiently numerous to command serious thought. The blame rests, perhaps, ultimately upon the colleges and the college board with their examination standards. The demand for this and that outline, for this and that fact, this and that interpretation of word or line, necessitates a final cramming for the English examination, or else a thorough pressing down of notes and analyses as one goes along. I question whether most older minds could master all the mysteries in a Shakespeare play, Milton's Minor Poems, and Burke's Speech against an examination day without some reviewing process. But the automatic nature of the methods applied in some schools becomes apparent enough when I quote the comment of one student upon another, who had never studied Burke's Speech in school, but had given her own synopsis to her master for discussion and correction.

> But, when there are so many texts with good synopses in the notes, wasn't it a waste of time for her to make her own?

A definition of culture which I heard recently may serve as a text for the practical sermon I would preach. "Culture," said one, "is what is left after you have forgotten all you have learned." Training, the power to read, to think, to express the thought, this, and not so much knowledge of so many books, should be the end of the study of English in the preparatory schools. If the college would but recognize this end, if the examinations were framed to test this power, then the senseless study of books never designed for abstracts and outlines, the insidious doling out of predigested outlines and abstracts would cease, and we should have a rational education of the boys and girls in the preparatory schools through the training in the English classics.

But when all this is said, does all the blame for the extremes to which the schools are led rest with the colleges? Is it necessary that the schools shall be such slaves to the college requirements? Can the schools of each city not plan some rational order of reading the college texts which shall be in accord with the natural development of growing boys and girls, grammar school leading to high school, department coöperating intelligently with department? Obviously the reading of college texts must not begin too early if they are to be grasped and retained; with equal obviousness, once begun, there are certain books fitted to certain years. Clearly "Ivanhoe" and "Lady of the Lake" should come early, as an open sesame to the magic outlaw world of daring and of chivalry; clearly Milton's Minor Poems should come very late as ministers to fineness of perception, thought, and feeling. Why, then, confuse the issues by bringing in the one too early, the other too late, merely for the sake of the board examination? A rational plan once made and followed intelligently, no mere "change in teachers," no mere "change in divisions," no change, even, in the college requirement, would necessitate the doubling now found in so many schools. I am not one who wishes that all the children of America should be reading the same book at a given moment; but some unity in the school system of every city there should certainly be, to prevent the present waste.

The text once studied with due care and intelligence, the rest must be left to the boy and girl. By their present methods of repetition and review, the schools are fostering that fatal spirit of dependence which is the bane of our modern preparatory training. This point cannot be urged too strongly. Suppose, even, that pupils are left to do their own reviewing and fail. Is the boy, or girl, who cannot review for himself a fit person to enter college? "I will show a man one corner of a square," says Confucius; "if he cannot find the other three for himself, I will have none of him." Would the schools but remember the saying, and make their preparation for the present type of college examinations less slavishly, shall I say "thorough," we should perhaps have fewer untrained, uneducated freshmen cumbering the ground in the colleges.

Let us study the classics in our schools once, rationally, intelligently, with a view to reading, marking, and inwardly digesting. Let us add to that study—in the time saved by a rational, intelligent order and method of reading the texts—such thorough, old-fashioned training in the elements of the language as shall enable the high-school graduate to analyze a sentence when he sees it, to correct an error if he makes it, to punctuate at least a paragraph correctly, and to write, himself, English more than "tolerably" correct. Then let him who survives the final test go to college. But above all, let him who could survive only through an automatic cramming process in the schools stay at home. Many instructors of freshmen in our colleges will feel, I am sure, that herein lies the hope of their release from the necessity of doing preparatory work in the freshman year.

NEWS FOR BIBLIOPHILES.

The Grolier Club decided, in 1904, to commemorate the twentieth anniversary of the founding of the club in 1884 by the publication of an authoritative life of Grolier, the "great ancestor of bibliophiles" as he has been called. After three years of preparation, the work is now published. Primarily the book is a translation of Le Roux de Lincy's "Recherches sur Jean Grolier," Paris, 1866. Baron Roger Portalis has written a preface and an additional chapter, and the whole has been translated by Carolyn Shipman (now Mrs. Whipple). Le Roux de Lincy appended to his volume a list of 349 books from Grolier's library; this list has been extended to 562. This alphabetical catalogue, with its companion list of private collectors and public institutions which possess or have possessed books from Grolier's library, fills more than two hundred pages. Jean Grolier was not a book-binder as is often supposed. He was a man of wealth, treasurer for Francis I., and holder of other high offices. He was a lover of fine books—paper, printing, and binding all considered—especially those from the presses of his friends the Aldi. At least one volume was printed by them at his expense, and several of their books were dedicated to him. Of some books he ordered a number of copies (six of the Aldine Virgil, 1527. are known from his library). Many of his books, bound especially for him, have the well-known legend "Io. Grolierii et Amicorum," in gilt on the front cover. His chief interest was in the best editions of the Greek and Latin classics. Since Baron Portalis is an authority on everything relating to book-collecting in France, it seems a pity that he did not rewrite or at least annotate more fully Le Roux de Lincy's book, instead of merely preparing a short preface and a supplementary chapter. Forty years of historical and bibliographical research must have brought to light new facts about Grolier as a man and as a book-collector. The notes are meagre and refer, with a few exceptions, to the enlarged catalogue. A few minor errors are corrected and at least one new one, equally unfortunate, is made. On page 93 Le Roux de Lincy, referring to the Séguier library says:

> But the most beautiful ornament of this magnificent house was the enormous library valued at 200,000 francs, begun by President Séguier, who left it in his will to the Chancellor, his nephew.

A footnote to "nephew" says "grandfather"; this note, should of course, read "grandson." The present volume is typographically beyond reproach. It is on Arnold's hand-made paper with the club's water-mark in every other leaf. The facsimiles of bindings, twelve in number, are reproduced in full color from volumes in the Bibliothèque Nationale and are admirably done. Three hundred copies have been printed, besides three on Japan paper.

The Anderson Auction Co. of this city offers, February 24, a collection of Americana, including more than one hundred lots relating to American railways; numerous State and local histories, and several of Walt Whitman's books, with author's autograph. Under Charles Lamb is described a volume of a scarce London periodical, The *Philanthropist*, Vol. 3, for 1813, in which Lamb's "Confessions of a Drunkard" first appeared. The cataloguer says: "Stated in Mr. Livingston's bibliography to have appeared first in the *London Magazine*, August, 1822." This statement is an error. On pp. 133-134 of his bibliography of Charles Lamb, Mr. Livingston in describing Basil Montagu's book, "Some Enquiries into the Effects of Fermented Liquors," 1814, in which Lamb's "Confessions" was first published in book-form, notes:

> This was not written especially for the volume, having already been printed in a magazine called the *Philanthropist*, as a "Letter to the Editor" in the number for January, 1813.

And on p. 134 Mr. Livingston adds: "Lamb published the article a third time, with additions, in the *London Magazine* for August, 1822." On February 25 the same firm sells a selection of fine books, including some rare American items. Among the more valuable lots are: The "Proposed" Book of Common Prayer, Philadelphia, 1786; Colles's "Survey of the Roads of the United States," 1789 (seventeen plates only); uncut copies of Drayton's "Memoirs of the American Revolution," 1821, and Ramsay's "History of the Revolution of South Carolina," 1785; Filson's Kentucky, in French, 1785; Marshall's Kentucky, 1824; the first edition of "Knickerbocker's History of New York," 1809; the famous "Bill in the Chancery of New Jersey at the Suit of John, Earl of Stair," 1747, with the three folding maps; and the *Pennsylvania Magazine* for 1775 and 1776, with all the plates. There are also some important books illustrated by Cruikshank, among them a set of the Comic Almanacs, 19 vols., 1835-53; "Illustrations of Time," 1827, and the "Table Book," 1829, in the original parts. On February 26 the Anderson Co. sells a collection of duplicates from the New York Public Library, largely Government publications and American newspapers, but including a few books likely to interest collectors, such as Charles Chauncy's "Letter to a Friend giving a concise but just Account of the Ohio Defeat," 1755, a rare pamphlet; Joutel's "Journal of the Last Voyage Performed by Monsr. de la Sale," 1714; Smith's "General Historie of Virginia," 1632 (lacking two of the maps), and his "True Travels," 1630 (lacking the plate); and Cluny's "American Traveller," 1769.

The Merwin-Clayton Sales Co.'s auction of February 25 includes first editions of Longfellow, Holmes, Whittier, Bret Harte, Eugene Field, and other American and English authors.

The sixth part of Judge James T. Mitchell's collection of engraved portraits will be dispersed on February 26 and 27, by Stan. V. Henkels, in Philadelphia. This section comprises portraits, mainly mezzotints, of the lord chancellors and chief justices of Great Britain, eminent English lawyers, Kings and Queens of Great Britain, and members of the royal families.

On the afternoon of each week day from February 17 to March 15 Columbia University will have on exhibition, in room 307 of the library, original editions of the English works of John Milton, lent for the purpose by several gentlemen of this city.

Correspondence.

LENIENCY TOWARD COLLEGE ATHLETES.

To the Editor of The Nation:

Sir: No well-informed person is likely to challenge the statement in the *Nation* of February 6, p. 116, that college undergraduates demand that athletes be treated leniently. Should its justice be questioned, the answer may be found in the italicized passages of the inclosed editorial from a college periodical.

Burt G. Wilder.

Cornell University, Ithaca, N. Y., February 7.

FACULTY VS. ATHLETICS.

The attitude of the University authorities toward athletics is again thrust unpleasantly before us. This time it is by *the havoc made among our prominent athletes by the last examinations*. Now of course, looking at this matter in a strict uncompromising light, one would be likely to say that the man who excels in athletics ought not, in justice, to be favored any more than the student who exercises marked ingenuity in dodging collectors at athletic games. But looked at in the light of what seems best for the name of the University, on what appears to be a truer footing between professor and student, and the light in which the great universities of the world regard the question, one cannot but say, if a student, to everybody, if a professor, to himself, that *discrimination should be made* and can honestly be made in favor of the man who devoted so much time and energy to bringing the name of ——— to the front in a way which, in the present age, appeals so strongly to people. Reputation for high intellectual standing need not suffer from superiority in physical attainments. By attracting attention to the one, interest is aroused as to the other, and it is a reputation to be envied when they go hand in hand. *Athletics leave a vast majority say* 956 *out of a* 1,000 *to take care of the scholarship.* We have established on firm foundations our claim to high scholarship, and while we take a recognized stand among the first of American universities, among the "big four" as it may be called in size, importance and scholarship, in athletics, we, a university of ——— students, wade along in the mire with ———, ———, and ———; and the reason for this? It is not because we are so far below the average man in strength and endurance, it is not because we are at a distance from the great 'varsities, nor is it because our students as a rule take little interest in anything besides regular work. It is primarily because the faculty sits upon athletics and athletes. It is not our purpose here to discuss recent actions in regard to an athletic field, lockers, etc., for they do not concern the faculty as nearly, nor the matter in hand so pertinently. But the damper on athletics in the shape of dropping athletes is quite to the point. We are making no plea and offering no excuses for our athletes' abilities as students, for they need none. The majority *are average students. But how can an average student get along in this University, if he devotes three or four hours a day in careful training?* But if leniency should be shown them, if when there is doubt the decision should be in the athletes' favor, it would make a great difference. This seems little to ask, but many professors make a point of deciding against athletes, apparently going on the supposition, that because a man is an athlete he cannot be supposed to know much about the subject. Now can this kind of thing be justified? If the faculty mean to blanket athletics let us have a manifesto to that effect and thus be saved useless expense and labor. But if the faculty should come out in favor of doing everything just and reasonable to forward the interest of athletics, we could promise them a year of brilliant success.

A WARNING TO BOOK BUYERS.

To the Editor of The Nation:

Sir: Purchasers of the Papers of the "Congress of Arts and Science, Universal Exposition, St. Louis, 1904," printed for the managers of the Exposition by Houghton, Mifflin & Co. in eight volumes, 1906, should beware of the work "International Congress of Arts and Science" now being offered as a subscription book, published by the "University Alliance" in fifteen volumes. It would appear that the University Alliance has bought up the unsold remainder of the official edition, and has carefully removed every trace of the connection of the Congress with St. Louis by printing new title-pages, cancelling such pages as betrayed that connection, and even, in one or more cases, cutting out introductory portions of the lectures. It now presents the collection as a new work "privately printed for members by the University Alliance." Illustrations in color and photogravure are added in the usual subscription-book style. In Vol. VI., for example, devoted to "Astronomy and Sciences of the Earth," we find a colored frontispiece, a nude figure of Phœbe by Perrey, a portrait of Copernicus (appropriate enough), Boulanger's Feast of Lucullus preceding the section Sciences of the Earth, and Knelle's Mental Education of a Greek Youth introduced as an illustration of palæontology. Does the University Alliance, one wonders, fancy that palæontology has something to do with archæology?

The prospectus is a masterpiece of ingenuity, for each sentence taken separately is strictly true, yet the effect of the whole is absolutely misleading, for one is left with the impression that this Congress, the executive committee of which bears many distinguished names, has been brought together by the University Alliance, and that the University Alliance itself is, as its name suggests, an alliance of universities which has conducted an expensive and difficult undertaking to a successful issue, in regard to which, it is stated, an avalanche of congratulations has been received.

The subscription blank names $10 a volume as the price (fifteen volumes), but agents are ready to come down to five. The original edition, in eight volumes, with text complete, but no illustrations, sold at $2.50 a volume, $20 for the set, instead of $150. Was there ever a more barefaced piece of imposition? For the honor of American bookmaking, such crafty schemes deserve to be relentlessly exposed.

William Coolidge Lane.

Harvard College Library, February 11.

INQUIRY FOR THE BOSTON "POST-BOY."

To the Editor of The Nation:

Sir: I am anxious to know where can be found copies of the Boston *Post-Boy* of May 20, 1754, and of the Boston *Post-Boy & Advertiser* of October 14, 1765. According to the "Check-list of Boston Newspapers," recently published by the Colonial Society of Massachusetts, not one of the fourteen libraries there listed owns copies of those issues. May I appeal to librarians through your columns?

Albert Matthews.

Hotel Oxford, Boston, February 12.

THE BODLEIAN AND AMERICAN BOOKS.

To the Editor of The Nation:

Sir: In the Bodleian Library, this morning, I was unable to get a copy of an edition of early plays edited by a noted American scholar and published in America more than three years ago. On inquiry at the desk I was told: "We buy no American books except county (he meant State) histories, or things like that. Most American publishers also publish in England, and we do not want duplicates." That is, the Bodleian Library, the second greatest repository of books in English, obtains practically no books whatever from America, but only English prints of such as may be published in both countries. Is not this attitude a little too conservative, even for the Bodleian?

Henry Noble MacCracken.

Oxford, February 6.

QUALIFICATIONS OF CABINET OFFICERS

To the Editor of The Nation:

Sir: You print in the *Nation* for January 30 a letter from Mr. F. C. Clark of Providence, R. I., in which he admits having puzzled his brain "for at least the last thirty years to determine what constitutes the qualifications of a Cabinet officer." He concludes by saying that he has failed "to see any guiding principle laid down for making up the Cabinet." Mr. Clark's quandary presents a difficult problem, not to say a series of problems. It certainly would seem on the face of things that the practice of Cabinet appointments through a period of twenty-two administrations, from 1789, should have established some principles that might prove useful guides to future Presidents.

The Cabinet has always been regarded as the President's immediate corps of assistants. This idea was expressed by Washington when he wrote in 1789:

> The impossibility that one man should be able to perform all the great business of the state I take to have been the reason for instituting the great departments, and appointing officers therein, to assist the supreme magistrate in discharging the duties of his trust.

While administrative work under his general direction was their chief function, the assistants were to advise the President on a large variety of matters and so inevitably became a council.

Leaving politics for the moment out of account, eligibility for any one of the nine great offices should rest upon ability. In the past, ability for Cabinet place has asserted itself most often through the profession of the law. Hence one may expect to find incumbents largely from that calling. Business ability—the ability of the capable administrator—has usually been in evidence, but especially of recent years. As in the case of the law, this ability can be tested in the ordinary experiences of life. Men reveal it easily, and are recognized for it the country over.

So far as the attorney-general's place is concerned, that office, as Mr. Clark recognizes, is comparatively easy to fill. It calls for a man thoroughly familiar with the law in its larger and smaller bearings. From the point of view of training alone, there are always many men capable of filling the position. The places of postmaster-general, and secretary of the interior, of agriculture, and of commerce and labor, plainly demand business capacity. When it comes to the four remaining offices—state, treasury, war, and navy—what shall be said? Here special qualifications would seem to be called for, though legal training and evidence of ability in administration are again sound general bases. Fortunately in modern times war is not the rule, and the demand for extraordinary expertness in the war administration or in that of the navy is limited to emergencies. Of all the departments, the state and the treasury call for distinguished talents and training. Here true statesmanship is most likely to be effective. Take such a period of thirty years as that extending from 1869 to 1899. In the State Department we find such men as Hamilton Fish, Evarts, Blaine, Bayard, Olney, and John Hay. This is a remarkable group. They were by no means all ideal secretaries. Blaine's blundering is a commonplace of recent history. There is, however, but one opinion of them as men of large calibre. Several among them were looked upon as Presidential candidates. Again in the Treasury department during the same period such names occur as John Sherman, William Windom, C. S. Fairchild, Carlisle, and Gage. Here also there is little doubt about the ability of the men. Whatever their particular shortcomings, they served really to distinguish the administrations of which they were a part.

Though formal training in law and approved ability in administration are impressively revealed in the history of the Cabinet, fitness will almost inevitably demand other qualities. To many a first-rate lawyer or able manager the departmental headships could never go. The Cabinet is a council of advisers. It must work harmoniously; its members must coöperate, and on occasions subordinate the individual to the great end. Now politics is apt to develop in men fitness for coöperation. In promoting local and national organization it tests leadership. The lawyer or the administrator *with political training* who may have risen to be a party chieftain, is likely to be a candidate for high place, possibly for a secretaryship. Why shouldn't he be?—especially if, in addition to his proved ability, his appointment meets an intelligently expressed public opinion and accords with the policy which, since early days, has been carefully regarded, of distributing Cabinet honors with some reference to all parts of the country.

The term *training* can, I think, be interpreted too narrowly when considering qualifications for a Cabinet place. There is no single road to a knowledge of finance or even of political economy. That there can be no single "guiding principle laid down for making up the Cabinet" is probably true. But I believe that a Cabinet office has seldom been filled, especially in recent years, without taking into account at least these three qualifications: trained intelligence; ability in administration; well proved readiness to coöperate in the best interests of the nation.

Henry Barrett Learned.

New Haven, Conn., February 10.

A "JOURNALISTIC OUTRAGE."

TO THE EDITOR OF THE NATION:

SIR: May I ask you to protest for me in the name of decent journalism against a form of journalistic outrage which is not too elusive to be "nailed"? No reasonable man thinks it worth while to object to misrepresentation by sensational headlines and unrepresentative extracts. That is a part of the game. The only remedy is never to permit one's self any vivacities of style or allusions to anything more modern than the eighteenth century.

But the deliberate attribution to a man of forged words which he did not write is another matter. The New York *World*, in a Chicago "special" of February 6, inserts in a jumble of verbatim extracts from a printed paper of mine the words "and Chicago is in the van of vulgarity." Neither this sentence nor anything like it is in my paper, and as the extracts are otherwise copied from a printed text, the insertion is a wilful and malicious misrepresentation devised to justify the sensational headlines. The paper in question was an innocent little address to teachers which I will not advertise further. That and my personality are of no importance. But I am interested to know whether you think that there is or ought to be any remedy, not against loose misrepresentation, but against deliberate journalistic forgery. If not, what security is there for any man's reputation for decency, sobriety, and temperate speech?

One may at least again express the hope that intelligent and fair-minded Eastern men will note the frequency of such cases as this, and not allow the legend to become established in their minds that the teachers at the University of Chicago differ appreciably from their co-workers in other parts of the country. PAUL SHOREY.

University of Chicago, February 10.

Notes.

In E. P. Dutton's list for publication this month we note "Lucretius: Epicurean and Poet," by John Masson; "The Commercial Relations of England and Portugal," by V. M. Shillington and A. B. W. Chapman; "Condition of the Border at the Union: Destruction of the Graham Clan," by John Graham; "Quaker and Courtier: The Life and Work of William Penn," by Mrs. Colquhoun Grant; "Complete Poetical Works of George Darley," with introduction by Ramsay Colles; "Poems, Letters, and Prose Fragments of Kirk White," edited by John Drinkwater.

Books to be issued by Houghton, Mifflin & Co. this spring and not hitherto announced are: "The Breaking in of a Yachtsman's Wife," by Mrs. Mary Heaton Vorse; "The Soul of Spain," by Havelock Ellis; "Lands of Summer," by T. R. Sullivan; and "The Intoxicated Ghost, and Other Stories," by Arlo Bates.

Scribner's will have ready this month a new volume of the series of Original Narratives of Early American History, containing "Bradford's History of Plymouth Plantation, 1606-1646," edited by Hon. William T. Davis. From the same firm will soon come part II. of the "Petit Trianon, Versailles," by J. A. Arnott and John Wilson; "The Essential Life," by S. B. Stanton; and "Mind in the Making," by E. J. Swift.

Vol. V. of "The Cambridge Modern History" is now ready to be issued by the Macmillan Co.

March 10 is the date set by the Macmillan Co. for publishing the first volume of the "Dictionary of National Biography" in its less bulky and cheaper form. The text will remain the same except for the correction of errors and revision of the bibliographies. The volumes, twenty-one in all, will appear monthly.

From Charles Scribner's Sons comes an enlarged edition of President Roosevelt's "Outdoor Pastimes of an American Hunter," with two new chapters, "In the Louisiana Cane-brakes" and "Small Country Neighbors," both of which have been rewritten since they appeared in magazine form. Six new illustrations have also been added to the book.

How is such a human document as "The Confessions and Autobiography of Harry Orchard," just published by the McClure Company, to be regarded? The present volume contains "A Personal Note of Introduction," by Edwin S. Hinks, dean of St. Michael's Cathedral at Boisé, who expresses thorough confidence in the reality of the criminal's conversion and his "honesty and present truthfulness." Nevertheless two juries which heard substantially the same story on the witness stand acquitted the men whom Orchard implicated in the most positive way with his offences. The book itself contains evidence of the peculiar status of the narrative. "Mr. Haywood has been acquitted," writes Orchard on almost the last page. "I can truthfully say I would far rather see him acquitted than hanged." Opposite page 92, however, is a group picture of the Executive Board of the Western Federation of Miners, and in the legend under it Haywood and Moyer are alluded to as "now under indictment." Each reader will have to decide for himself in what attitude to approach this singular story.

James Thomson, poet of "The Seasons," has suffered a peculiar fate. In most cases the creator of a *genre* (he, that is, who first sees its capabilities and stamps it with his genius) retains a primacy among workers in that field; so at least it has been with the drama, the epic, and the novel. But in nature-writing Wordsworth and other late-comers have entirely overshadowed Thomson, who may be said to have created the kind. "The Castle of Indolence" retains a certain interest for us through its medley of limpid language, personal allusions, and quaint imagery, but "The Seasons" has become insipid to palates accustomed to the higher flavor of romanticism. G. C. Macaulay, who has writen the life of Thomson for the English Men of Letters, had a difficult task to make his subject interesting, and has succeeded creditably. The chapters in which he has followed the various poems step by step with exposition and criticism are, in our opinion, relatively too long. Part of this space might have been bestowed on the biographical section, especially in filling out Thomson's relations to the men of his day. Mr. Macaulay has shown that he can handle such themes gracefully. Again the comparison of Thomson's attitude toward nature with that of his contemporaries and his successors is well carried out; it might have been lengthened to advantage by a fuller treatment of nature-writing as Thomson found it, and by a touch more of philosophy. But notwithstanding what may be censured as a slight disproportion in parts, the book as a whole is soundly conceived and well executed.

In four illustrated volumes, with introductions by R. S. Garnett, the Macmillan Co. gives a translation of stories from one of the most horribly fascinating works ever written, "Crimes Célèbres," by Dumas. The first volume contains "The Borgias," "The Cenci," "Joan of Naples," and "The Countess de Saint-Géran"; the second, "Urbain Grandier," "Derues," "La Constantin," "The Man in the Iron Mask," "Murat," and "Karl-Ludwig Sand"; the third, "The Marquise de Brinvilliers," "Martin Guerre," "The Marquise de Ganges," "Mary Stuart," and "Varinka"; the fourth, "Ali Pacha," "Massacres of the South," and "Nisida."

In their "Old English Grammar" (West Saxon), by Joseph Wright and Elizabeth Mary Wright (Henry Frowde), the authors aim to give all the information needed by the ordinary student, but their work will not be disdained by the specialist. Of scientific accuracy and method the names on the title-page are a sufficient guarantee. The works of German scholars have also been laid under contribution. Some may doubt the wisdom of Professor Wright's extensive use of hypothetical prehistoric forms; yet these, in the sections which the beginner will master first, are not unduly obtrusive; and elsewhere, especially in the chapter on the verb, they are practically indispensable. Of course the grammar is to be used in connection with a reader. Thus tried in a class moderately advanced, it stands the test well. We might wish the notes on phonetics, now scattered through the book, had been given also in a brief separate chapter. The sections on the deviations of other dialects from West Saxon seem over-condensed. As a whole, however, the book is a model of completeness and compactness; there is a comprehensive index; the typography is excellent, the appearance pleasing. This is the first in a series of historical and comparative grammars under Professor Wright's editorship. A second volume dealing with English syntax may be expected within a year.

The Connecticut Historical Society, after a lapse of twelve years, has continued the publication of the official papers of the Governors, so admirably begun in the "Talcott Papers," issued in 1892 and 1896. The new series will contain the correspondence of Talcott's successor, Jonathan Law, Governor from 1741 to 1750. The original documents are mainly preserved in the archives of the society, in five folio volumes, and were acquired in 1840 from Larned Hebard of Lebanon, administrator of the estate of William T. Williams, son of the signer and grandson of Gov. Jonathan Trumbull. Originally they formed part of the collection of manuscripts relating to the early history of Connecticut, which had been gathered by Gov. Trumbull before the breaking out of the Revolution. The first volume of "Law Papers" is the eleventh of the Collections of the society, and has been edited by Albert C. Bates, its librarian. The contents are less interesting and valuable than were those of the volumes containing the Talcott papers, but they are important as furnishing evidence for the completion or continuation of many of the questions raised during Gov. Talcott's administration—the religious revival, the Intestacy case, the legal conflict over the possession of the Mohegan territory, bills of credit, etc. It also presents a number of new problems and activities, such as Indian difficulties at Sharon and Niantic, preparation for war with France, equipment of troops for the expedition against Louisburg, and counterfeiting of the colony's bills. The present volume closes with 1745, and at least one more volume will follow.

Volume I, Part 2, of the Proceedings and Papers of the Bibliographical Society of America is largely devoted to the meeting held in Providence with the American Historical Association, the Political Economy, Political Science and Social Science Associations, in December, 1906. The interest lies in the various papers in which the bibliographic needs and possibilities of the social sciences are discussed. W. Dawson Johnston gives an interesting survey of existing attempts in that direction, while Dr. E. C. Richardson discusses future possibilities; and the needs of branch sciences are presented in short papers by several speakers. The most valuable contribution is the list of bibliographies published by historical societies in the United States, which Isaac S. Bradley has prepared to accompany Dr. Reuben Gold Thwaites's paper on the bibliographical activities of these societies.

Over half a century since, in 1852, Dr. K. Stark published his well-known work on Gaza, a sort of thesaurus of all then available information with regard to the town, its location, its inhabitants, its antiquities, and its history up to its capture by the Moslems in 634. Since 1852 the discoveries in Egypt, Babylonia, Asia Minor, Greece, Crete, Cyprus, and Palestine itself, have so completely revolutionized our ideas with regard to the early history of the entire Mediterranean region, and also with regard to the historical use and value of the Bible, on which, with the Greek historians, Dr. Stark depended for his information covering the period before the time of Alexander, as to make the work practically useless. The fifth volume of the Columbia University Oriental studies, intended to fill to some degree the gap created by the passing of Stark's work, is a new history of Gaza from the earliest times to the present day, by Dr. Martin A. Meyer (Columbia University Press, the Macmillan Co., agent). From the siege of the city by Alexander the Great in 332 B. C. to its capture by the Moslems in 634 A. D., a period of almost one thousand years, Dr. Meyer's little volume is practically a summary of Dr. Stark's larger work. From 634 to the present time Dr. Meyer has had to break new paths, gathering his material chiefly from such Arabic sources as are already in print, as far as those are accessible in the libraries of this country. For the period preceding 332 B. C., while the path had been broken by Stark, the material used by Dr. Meyer is almost entirely new, even to the treatment of the Biblical sources. This monograph will be a welcome addition to the libraries of Oriental, and especially Palestinian scholars. The author is sane and careful; he appends to each chapter notes containing, among other things, references to the source. In preparation for this work the writer had the great advantage of spending a year in Palestine as a fellow of the American School of Oriental Research in Jerusalem, and thus acquiring a personal, first-hand knowledge of the site and surroundings of Gaza.

After an interval of two years the second part of Faridu-d-Din Attar's "Memoirs of the Saints" has appeared, edited by R. A. Nicholson, lecturer in Persian in the University of Cambridge (London: Luzac & Co.; and E. J. Brill). The value of this work as a contribution to Persian Moslem hagiology is well known. The present volume includes the remainder of the work, together with a supplement containing twenty-five additional biographies. A valuable feature of the edition is a detailed list of the archaisms. In addition to variants the editor has added a table of parallel passages in the "Memoirs" and the "Risalat" of Al-Qushayri. This second part forms the fifth volume of the series of Persian Historical Texts, edited by E. G. Browne, the well-known Cambridge Persian scholar, and Mr. Browne announces that with this volume the series is brought to a close. He adds, however, that any works that could appropriately be included in the series will be published by the Trustees of the Gibb Memorial, whose liberality we have already referred to. Mr. Browne has earned the gratitude of scholars by his self-sacrificing zeal in the publication of Persian texts, an enterprise that cannot be financially profitable; and it is matter of congratulation that we may hope for the continuance of these publications.

For his edition of Benjamin of Tudela, published in 1840-41, Asher had to depend upon two printed editions, of 1543 and 1556, and was frequently at a loss when confronted by doubtful readings. M. N. Adler has been fortunate enough to get access to three complete manuscripts and fragments in two other manuscripts, and on these he bases his publication, "The Itinerary of Benjamin of Tudela," with English translation and notes (Henry Frowde). For the Hebrew he adopts the text of the manuscript in the British Museum which is thought to be of the thirteenth century; variants he places at the bottom of the page. To the English translation he has added brief notes, referring the reader for fuller information to Asher, the "Jewish Encyclopedia," Gratez, and other authorities. He gives good reasons for holding that Benjamin's absence from Europe is to be placed between the years 1166 and 1171. The volume is provided with an English index, a Hebrew index, and a list of emendations of text. Mr. Adler thus gives in a small compass excellent material for the criticism of Benjamin's text and of his historical statements; Asher's edition, however, is still an indispensable help. Benjamin's reports of what he himself saw may be regarded as trustworthy. What he says on the authority of others (and this part of his work can usually be distinguished from his account of his own observations) is to be taken with caution. He is not free from the credulousness of his time.

From the Clarendon Press comes a second edition of "An Introduction to the Fifth Book of Hooker's Treatise of the Laws of Ecclesiastical Polity," by the Right Rev. Francis Paget, Bishop of Oxford. It is little more than a reprint of the first edition, with the exception of a few added references and a useful index. For obvious reasons Hooker has never been as much read in this country as in England, which is only another reason for welcoming the Bishop of Oxford's standard exposition of the work.

A text-book for Bible classes which are sufficiently ambitious to desire to study the Old Testament from the historical point of view is "Israel's Golden Age," by Prof. J. Dick Fleming of Manitoba College, Winnipeg (Imported by Charles Scribner's Sons). The period is that of Saul and David, a difficult, although important and interesting, portion of Hebrew history. Professor Fleming has found his way through the conflicting sources with no small skill, and his manual affords sufficient help for the serious student to form his own opinions intelligently. The volume belongs to the Handbooks for Bible Classes and Private Students projected by Prof. Marcus Dods and the Rev. Alexander Whyte.

During the last quarter of a century Palestine has been undergoing a great change, owing to the large and ever-increasing horde of pilgrims and tourists, to the establishment and growth of foreign institutions, settlements, and colonies, to emigration and consequent contact of the natives with foreigners, to educational and missionary effort by foreigners in Palestine, to the great influx of Jews from Russia, and finally to the introduction of railways, steam-mills, and the like. This change has deeply affected the domestic and social life of the people; and before many years the instructive resemblances to the conditions of Bible times will have ceased to exist. The fact that the old life is thus vanishing has stirred not a few recent observers to publish books on the home life of the Palestinian peasants. The latest of these books, and in many respects the best, is a little volume, "The Peasantry of Palestine: the Life, Manners, and Customs of the Village," by Elihu Grant, (New York: The Pilgrim Press). For three years Dr. Grant, now associate professor of Biblical literature at Smith College, was a missionary teacher in the Friends' School at Ramallah, near Jerusalem, from which as a base he visited mission stations and schools in central Palestine. Intensely interested in the village folk, Dr. Grant recorded with camera and pencil the details and surroundings of their life—utensils, houses, songs, customs, superstitions, linguistic peculiarities, antiquities. The result of those notes with lens and pen is the present work, charmingly written and abundantly illustrated. Convenient foot-notes, referring to passages in both the Old and the New Testaments, which are illuminated or illustrated by the book, make it a useful manual for the Bible student.

A number of the volumes of the Biblische

Zeit- und Streitfragen, the conservative and orthodox tractates called forth by the success of the liberal Religionsgeschichtliche Volksbücher and edited by Pastor Julius Böhmer and Prof. Friedrich Kropatscheck, have been translated by the Rev. Bernhard Pick and appear as the Foreign Religious Series under the editorship of the Rev. R. J. Cooke. Six volumes constitute the first English series: "The Virgin Birth," by Richard H. Grützmacher; "The Resurrection of Jesus," by Eduard Riggenbach; "The Sinlessness of Jesus," by Max Meyer; "The Miracles of Jesus," by Karl Beth; "The Gospel of John and the Synoptic Gospels," by Fritz Barth; and "New Testament Parallels in Buddhistic Literature," by Karl Von Hase (New York: Eaton & Mains). The series is designed to "refute the findings of rationalistic thought," and to show that "the highest grade of scholarship is not wholly on the side of radicalism." While the volumes vary in merit, the sin common to them all is that they furnish the reader no adequate conception of the views to which they are opposed, and attempt to cover by earnest rhetoric the serious difficulties involved in the problems they consider.

The "Kompendium der Kirchengeschichte" by Dr. Karl Heussi, of which the first half, covering the ancient church and the early centuries of the middle ages, has just been published by Mohr of Tübingen in a small volume of 200 pages, promises, when completed during the current year, to be a *multum in parvo* for this department. It succeeds in outlining clearly the leading factors and forces in the development of the external and internal life of the church, and to do so with due regard to the results of modern research.

The fourth edition of the "Geschichte und Kritik der neueren Theologie," by Fr. H. R. von Frank (Leipzig: A. Deichert), is practically a new work, as the editor, Prof. R. H. Grützmacher of Rostock, has thoroughly revised the book in the light of recent knowledge. The title is perhaps too general, as the work deals only with the theological development of Germany since the days of Schleiermacher, and ignores non-German theology even where it has influenced that of the Fatherland.

A new series representing a conservative type of Apologetics, is being issued by the Agentur des Rauen Hauses, Hamburg, under the general editorship of Dr. E. Dennert. The series bears the general title of Ewigkeitsfragen im Lichte grosser Denker, and two volumes have been issued: one a chrestomathy from the writings of Kant, edited and interpreted by Prof. L. Weis; and the other a similar collection from the Danish philosopher and theologian, Sören Kierkegaard, with comment by Dr. A. Bärthold. Further volumes on Michael Angelo, Tauler, Newton, Tholuck, Gerter von Kaisersberg, Wichern, Plato, Francis of Assisi, and others, are announced.

The first instalment of the new "Grammatik der Septuaginta," by Prof. Robert Helbing of Karlsruhe, just issued (Göttingen: Vandenhoeck & Ruprecht), deals with etymology and forms. The abundance of new material found, especially in the papyri treasures of Egypt, makes the investigation of the *Koiné* almost a new science at present, especially in the elimination of the many so-called "Hebraisms" of the Septuagint and New Testament. Especially for the vexed problem of the Septuagint text, Helbing's grammar promises an abundance of good things.

The new "Reallexikon der prähistorischen, klassischen und frühchristlichen Altertümer," by Dr. Robert Forrer (Berlin: W. Spemann), is a solid volume of one thousand pages and three thousand illustrations. It seeks primarily to meet not so much the wants of the specialist and archæologist, as of the general student. It covers the archæological researches from the earliest periods down to the sixth Christian century, and deals more fully with central Europe. The illustrations are exceptionally good.

As the author has been able to draw heavily on hitherto inaccessible Russian sources, the new volume of K. K. Grass, "Die russischen Sekten," recently completed by the publication of Parts 3 and 4, is especially valuable. This, the first volume of a series, is devoted exclusively to Die Gottesleute, oder Chlüsten, the largest body of dissenters, numbering some 140,000. The author rejects all the theories usually advanced in reference to the beginnings of this sect, and finds evidence to connect them with the Massalians, who date back to the fourth century and represent a special type of "spiritual" Christianity. He further declares that their ethical ideals can be easily traced in the teachings of Tolstoy. (Leipzig: J. C. Hinrichs.)

Dr. Friedrich W. Foerster, professor of philosophy in the University of Zürich, has recently issued two works on modern problems of pedagogics. The first is entitled "Schule und Charakter," with the sub-title, "Contributions to the Pedagogics of Obedience and to Reform in School Discipline" (Zürich: Schulthess & Co.). Foerster is a decided advocate of the training of the will. The other work, dealing with a much-discussed special problem, is entitled "Sexualethik und Sexualpädagogik." Here again the author insists upon a thorough training of the will and character rather than a merely intellectual knowledge of the physiological facts in the sex problem (Munich: Joseph Koesel).

Under the general title of Stätten der Kultur, the house of Klinkhardt & Biermann, Leipzig, with Dr. Georg Biermann as general editor, is publishing a series of finely illustrated Städtemonographien. So far four have made their appearance, volumes on Berlin, Frankfurt, Bremen, and Rothenburg, each by a different author. The price of each volume is 1 mark.

"Le Prix Nobel en 1905," when Robert Koch, Henryk Sienkiewicz, and Bertha von Suttner were among the laureates, has just been issued. It contains, as usual, the proceedings at the Nobel memorial meetings in Stockholm and Christiania, sketches of the laureates, their portraits, reproductions of the medals and diplomas, and also three of the Nobel lectures: "Über Kathodenstrahlen," by Philipp von Lenard; "Über den derzeitigen Stand der Tuberkulosebekämpfung," by Robert Koch; and "Die Entwickelung der Friedensbewegung," by Bertha von Suttner. The Baroness von Suttner emphasizes her belief in the future of *Pacificismus*. The old, the past, the speaker said, cannot rule forever, evolution rules in the social as in the geologic world, and evolution is always towards something higher, something better. She quotes the following from a letter which Alfred Nobel wrote her (it was she who aroused his interest in the peace movement):

> We ought soon to come so far that all the countries mutually will bind themselves to attack the one that attacked another country. That would make war impossible, and would compel even the most brutal and most irrational power to appear before the court of arbitration, or to keep the peace. If the "Dreibund" would embrace all, instead of only three countries, then peace would be secured for centuries.

We welcome an English-made edition (New York: The Macmillan Co.) of George Sand's "La Mare au Diable," in book, not school-book, form with attractive illustrations by Gertrude Leese. The "Notice Analytique," by Sainte-Beuve, is printed as a preface. The same house issues volumes IX. and X. of The Novels of Björnstjerne Björnson, containing "In God's Way," translated by Elizabeth Carmichael.

"Perugia antica e Perugia moderna: Indicazioni Storico-Topografiche," by Raniero Gigliarelli, is being published by the Unione Tipografica Cooperativa, Perugia. In 1903, Dott. Raniero Gigliarelli published his "Venere. Racconto storico della Meta del Secolo XIV." (Perugia: Donnini), a very erudite but most unpleasant book, which, under the form of a novel, treated of the manners, customs, and social life of the Perugians of the Trecento. The notes, which often occupy at least three-quarters of the entire page, are not only crammed with valuable information, which it would be difficult to find elsewhere, but also constitute a veritable mine of reference for further research. In a word, no student of mediæval Perugia can afford to ignore the book, though, from any other point of view than that of the student, it would be difficult to find a redeeming feature in its 516 pages. The present volume, we are glad to say, possesses all the merits of its predecessor, with none of its drawbacks. Published in connection with the recent "Mostra d'Arte Antica," it constitutes a guide-book to Perugia the like of which hardly exists for any other town. The illustrations, which average at least one for every three pages of the text, are not only excellent in themselves, but are really illustrative of the written matter, and include many reproductions of old plans, maps, and documents of which the originals are difficult of access. The author's style is pleasant and readable. His knowledge of ancient and modern Perugia is exhaustive. The book is well printed, and will form an unusually handsome volume. The edition is, we believe, a small one.

Some interesting fragments of Greek literature recently found in Egypt have now been published by the Swiss scholar M. Nicole. The fragments belong to the "Apology" of Antiphon. Antiphon, who was born at Rhamnos in Attica soon after 480 B. C., was a well-known teacher of rhetoric in Athens. The historian Thucydides was one of his pupils and speaks of him with the greatest admiration. He belonged to the aristocratic party and at the time of the Peloponnesian war was influential in bringing in the oligarchic government. On the fall of the oligarchs and the rise of the democratic party, Antiphon was charged with high treason. He did not, like so many of his friends, make his escape, but stood his trial. On this occasion he delivered an oration in his defence, which Thucydides called "the most beautiful apologetic discourse ever given." Of this speech, four fragments have been found. The first fragment belonged evidently to the introductory part of the "Apology." Antiphon does not deny the charge that he took part in bringing the oligarchs into power, but he proves that the motives on which he acted were unselfish. The other fragments are in a bad state of preservation and their meaning has only been made out with difficulty. In the last fragment, Antiphon seems to have made a pathetic appeal to the judges. He reminds them of his family whom he did not want to abandon and without whom he could easily have made his escape. We know that his appeal remained unanswered. Antiphon was condemned to death and had to drink the hemlock; his fortune was confiscated and his house pulled to the ground.

Appended to the report for 1907 of the Enoch Pratt Library of Baltimore, is a table of statistics for twenty-five of the leading public libraries of the United States. According to these figures, in the number of volumes, in home circulation, registered borrowers, city appropriation, and annual expenditures the New York Public Library stands first, and in the proportion of the population registered as readers, is exceeded by but one of the libraries in the list. In the ratio of circulation to population, first place is held by the Springfield (Mass.) Library; it is closely followed by Cleveland and Buffalo. In the per capita tax for library support, Boston stands first, the amount being fifty-four cents. Springfield receives only a fraction of a cent less. The lowest per capita tax in any of the cities named is for Providence, eleven cents. Jersey City pays twelve cents. The average per capita tax for all the cities is about twenty-one cents. In the per capita supply of books, Boston, which has long been first, is now second, yielding the first place to Springfield.

Sir James Knowles, founder and editor of the *Nineteenth Century*, died last week. He was born in 1831, and was trained to be an architect. From his youth he had dabbled with literature, and in 1860 he compiled "The Story of King Arthur" from Sir Thomas Malory. In 1869 he originated the Metaphysical Society, a club of forty eminent representatives of various forms of belief and disbelief, including such men as Gladstone, Frederic Harrison, Cardinal Manning, Huxley, Father Dalvagius, Tyndall, Clifford, and John Morley, St. George Mivart, Frederick Maurice, Dean Stanley, Arthur Balfour, Ruskin, Bishop Magee, John Lubbock, and Mark Pattison. In 1870 he succeeded Dean Alford as editor of the *Contemporary Review*, which gained under his management a very strong position, thanks to the assistance of the members of the Metaphysical Society. The *Contemporary* changed hands seven years later, and Knowles started the *Nineteenth Century*, which, supported as it was by the most eminent English writers of the day, mostly members of the Metaphysical Society, became one of the leading monthlies.

Albert William Quill, author of several legal works and "The History of Tacitus," has just died in Dublin.

The death is announced at the age of fifty-two of Amédée Hauvette, professor of Greek poetry in the University of Paris, president of the Association for the Encouragement of Greek Studies, and member of the Society of Antiquaries. Professor Hauvette's "Hérodote, historien des guerres médiques," was crowned by the French Academy.

COLERIDGE.

La Vie d'un poète: Coleridge. Par Joseph Aynard. Paris: Hachette.

Biographia Literaria. By S. T. Coleridge. Edited with his Æsthetical Essays by J. Shawcross. 2 vols. New York: Henry Frowde.

The Indebtedness of Samuel Taylor Coleridge to August Wilhelm von Schlegel. By Anna Augusta Helmholtz. Bulletin of the University of Wisconsin, No. 163.

M. Aynard's animated scholarship suggests a comparison with the work which inspired it, and which has set a standard for other volumes dealing with the Coleridge-Wordsworth group, "La Jeunesse de William Wordsworth," by Prof. Legouis. The problem that Legouis chose was definite and feasible. By means of the "Prelude," he was enabled to watch the very pulse of Wordsworth's development, with the steadfast, objective eye of the poet himself. M. Aynard has elected a task far more extensive, and, in our present state of knowledge, impossible to achieve completely. He has essayed an interpretation of Coleridge, the whole man. It may be urged in general that the way of the sentimentalist is bound to remain an enigma. And concerning Coleridge in particular we know too little during the most critical period in his career as poet, say the years 1797-1798, to be safe in judging of his life throughout. As to his reading we have only scraps of information; we have no certain proof that he was then addicted to opium; the external evidence on the composition of his best known poems is scanty and in part conflicting. Still, throughout the various poems and fragments which Coleridge wrote in his efforts to collaborate with Wordsworth on "Lyrical Ballads," there is a good deal of internal evidence that calls for further inspection; and a meticulous examination of every document that bears on the studies of the two poets in Somersetshire would to some extent enlighten us on the nature of their literary pursuits. In his history of this Quantock period M. Aynard does not see more deeply than his predecessors, although the biography of the poet Coleridge ought to be focused there and not elsewhere. Accordingly, our disappointment in this stimulating book arises largely from a feeling that its emphasis is misplaced.

There are, we may note, a few slips in detail. Thus the assertion (p. 139) that the "Ancient Mariner" and the "Three Graves" owe nothing to the poetry of Wordsworth is obviously made in haste; for Wordsworth furnished the unifying element in the plot of the first, as well as nine or ten lines, possibly more, of the text itself, and "the subject," so he says, of the second. The misprints, too, are frequent, and there is not enough uniformity in the spelling of proper names and the citation of titles (e. g., *Gillman*, p. 324, *Gillmann* p. 360). We do not see why *De Quincey* (pp. 217, 264, 265, etc.) should in one case be given with a large *D*, in another with a small *d*, and in still another without any prefix. In matters like these, M. Legouis was more scrupulous, as he was more generous in his references for statements of fact. Nevertheless M. Aynard, having read virtually everything on his topic, has added liberally to our fund of specific information about Coleridge; for instance, he tells us much that was unknown to Dykes Campbell regarding the visit to Malta. He also presents a number of interesting and heretofore unpublished marginalia.

The defect in general perspective is more grave. Coleridge, M. Aynard thinks, was by nature a poet, not a philosopher. His will was constitutionally weak, the result of heredity and early environment; hence his disastrous recourse to narcotics was not so much a cause as an effect of his instinctive habits of volition. Furthermore, although he had a great deal to say about France and was supposed to have fathomed the Kantian and other philosophies, he never really understood the tendencies of the French Revolution, never really sympathized with the French people, never really entered into the spirit of any German philosopher, and never was stirred to the core by any foreign literature. Why? Because at heart he was an Englishman of the eighteenth century, and because as an individual he was an introspective sentimentalist. What we have put bluntly, M. Aynard has developed with due qualification. But supposing this summary of Coleridge's limitations to be substantially true, why has the French scholar devoted so much space to influences that were remote, and so little, relatively, to those experiences that touched the poet in his essence? For example, if Coleridge's lifelong estimate of France was insular and warped, and was after all a minor thing as compared with the handful of poems by virtue of which he mainly survives, why does this book pay such excessive regard to the course of the Revolution? In the biography of a poet, why not make his poetry the obvious centre? M. Aynard has an enviable acquaintance with the poetical works of Coleridge, but his knowledge of the text is extensive rather than intensive, and is overbalanced by his interest in the history of his own nation.

If one is ever to surprise the inner secret of Coleridge, it must be, as we have hinted, through a more intensive examination of his earlier life and poetry; through an inclusive and sympathetic understanding, not only of Coleridge, but of Wordsworth also, and of Dorothy Wordsworth as well; through a fuller realization than M. Aynard betrays of the meaning in Dorothy's remark that her brother and she and their friend were three people, "but one soul."

In regard to heredity and environment, M. Aynard, we imagine, is something of a necessitarian, trusting the poet's sentimental recollections too implicitly, and reading the story of his later years too clearly in his childhood and youth, where contemporary evidence is meagre. As for heredity, we should remember that neither the Rev. John Coleridge nor Coleridge's mother has ever been accused of infirmity of will; and that the general record of their descendants does not harmonize with a belief that their most gifted child, with his extraordinary powers of application, was predestined to a career of grief.

Yet with all deductions, M. Aynard's study is the first consistent attempt to explain a baffling character in the light of all the facts, and it will doubtless remain the foremost biography of Coleridge until we are favored with the strangely delayed life by the poet's grandson. It ought to be translated into English and provided with an index.

The large amount of conscious and unconscious borrowing in Coleridge's "Biographia Literaria," its incompleteness and profound suggestiveness make it eminently a book for the annotator. The standard edition of 1847, prepared by the daughter and son-in-law of the poet, has an Introduction in which the nature of Coleridge's dependence on Schelling is explained at considerable length, and with some animus against those who accused the English writer of plagiarism. That Introduction must always remain the basis of such studies; but it is somewhat vague in its philosophy and not satisfactory to the present-day student. There is reason therefore to welcome this excellent reprint from the Clarendon Press. Of the Notes added at the end of each of the two volumes we can only say that so far as we have looked into them they are full and accurate, affording a valuable running commentary on the text. Mr. Shawcross's Introduction repays a careful reading; it not only fulfils its first intention of clearing up the relation of Coleridge to Kant and Schelling, but throws light on the whole international movement of romanticism.

It was to be expected that, as an Englishman, Mr. Shawcross would be a jealous advocate of Coleridge's originality. In our opinion he carries this argument a little too far formally and not quite far enough essentially. It is undoubtedly true that Coleridge's study of the Neoplatonists and of the Cambridge Platonists, in particular, had prepared him for the influence of the German romanticists, but something more definite should have been said of the *Gefühlsphilosophie* which permeated all of Coleridge's thought. It is this that explains the parallelism in his writings, to German books he had, as Crabb Robinson observes, never read. And it is possible that Mr. Shawcross, as he apparently minimizes the homogeneous spirit that pervaded the whole of German romanticism, does not see how easily Coleridge, with his temperament and preparation, might have been deeply affected by that movement before his visit to Germany made him minutely acquainted with the leaders of the school.

On the other hand, Mr. Shawcross does not make perfectly clear the full significance of the causes which led Coleridge to repudiate the final issues of romanticism. With all his mysticism and sentimentality Coleridge still possessed two British qualities which preserved him from the extremes of Teutonic romanticism: his deficiency in logical tenacity and his sense of character. With the Briton's usual inconsistency he could follow the romantic argument half way, and there break off. He himself—and Mr. Shawcross follows him—makes religion the point of divergence. Where romanticism dissolved into pantheistic heresy, he drew back professedly in favor of the Trinity and the Thirty-nine Articles. It might, we think, be shown that this withdrawal was not so much due to religious conviction, for at bottom Coleridge was intellectually a pantheist, as to a British repulsion at the dissolution of judgment and character which ultraromanticism implied. It may even be that his own uncertainties of will sharpened the uneasiness of his mind and conscience in this matter. Thus in his marginal note to Schelling's "Philosophische Briefe":

> *Der Gedanke, mich der Welt entgegenzusetzen* (the thought of opposing myself to the world) not only *hat nichts Grosses für mich* (contains nothing elevating for me), but seems mere pot-valiant nonsense, without the idea of a moral power extrinsic to and above the world—

in such a note the real emphasis is not on "extrinsic to" and "above," but on "moral power"; it was not pantheism that repulsed him, but the undermining of the conscience. And, again, Mr. Shawcross quotes a sentence from Friedrich von Schlegel which shows where Coleridge's traditional belief in judgment and will would come into conflict with romanticism:

> It is the beginning of all poetry to abolish the laws and methods of the rationally proceeding reason, and to plunge us once more into the ravishing confusions of fantasy, the original chaos of human nature.

Now, it was the first aim of Coleridge's "Biographia Literaria" to set forth the imagination as something directly contradictory to this romantic fancy. Mr. Shawcross observes very aptly:

> By his lifelong vindication of the truth, that the activity of imagination is determined subjectively by the laws of common reason, and objectively by the truth of things, and thus differs essentially from the accidental and seemingly capricious combinations of fancy, Coleridge rendered an invaluable service to the cause of criticism, both in his own day and for all time. The anarchy of taste which followed the shattering of the old idols was even a more dangerous enemy to art than they had been. The critics of Coleridge's day, having emancipated themselves from the "classical" tradition, were forced by a natural reaction into the opposite extreme of lawlessness.

Mr. Shawcross has done good service in exhibiting this confusion of Coleridge's position, in so far as the poet was thoroughly permeated, but not entirely subdued, by the virus of Teutonic romanticism; our only complaint is that his procedure has not been quite sufficiently determined. To estimate the value of his work, one needs only compare it with the flabby chapter on Coleridge in Saintsbury's "History of Criticism."

As an aid to determining more precisely the extent and character of Coleridge's German borrowings, some mention may be added of a college thesis by Miss Anna Augusta Helmholtz. After following the early charges of plagiarism against the English philosopher, Miss Helmholtz gives in parallel columns the actual passages in the Lectures of Coleridge and the *Vorlesungen* of Schlegel, which show similarity of thought or language.

CURRENT FICTION.

The First Secretary. By Demetra and Kenneth Brown, New York: B. W. Dodge & Co.

This tale of modern Constantinople is told in sufficiently good-humored and cavalier fashion to engage, perhaps rather unjustifiably, the attention of the conscientious reader. It plays successfully upon the weakness of the Westerner, of the youthful Westerner, at least, for the romance of the harem, the conventional but ever-pleasing mystery of yashmak and lattice and eunuch-guarded penetralia. Its chief specific object is to promote the nuptials of a child of the harem and an American Secretary of Legation. Rhasneh is the daughter of a pasha, the betrothed of a bey, and the beloved of the Sultan, so that there are sufficient difficulties in the way of the happy event to make the game worth while in the eyes of a dashing secretary and a pair of light-hearted chroniclers. It is a book to pass the time and it has the distinct merit of not pretending to be anything else.

Jacquette: A Sorority Girl. By Grace Ethelwyn Cody. New York: Duffield & Co.

This story, although it has a problem and a purpose, might be placed with perfect propriety in any Sunday-school library. The problem is whether secret societies in schools exert a helpful or a harmful influence upon their members, and the author leaves us in no doubt as to her own opinion on the subject. It is pleasant to find one whose style so strongly suggests youth, advocating the old-fashioned idea that a school is a place in which to study something besides the not always gentle art of amusing one's self; and, while the appeal of the book must necessarily be somewhat limited, its atmosphere is wholesome. The author wisely contents herself with a mere suggestion of pending sentiment, and leaves Jacquette still in the pretty twilight that comes before the dawn of dreams. On the whole, although a creature a little too bright and good for human nature's daily food, she may prove profitable company for her contemporaries in real life.

The History of Babylonia and Assyria. By Hugo Winckler; translated and edited by James Alexander Craig. Pp. 352. New York: Charles Scribner's Sons. $1.50 net.

The German edition of Professor Winckler's "History of Babylonia and Assyria" appeared in 1899—eight years ago. Since that time, much new material has come to light and much has been done by Assyriologists to improve on the interpretation of both the older and the newer material. The wisdom therefore of publishing a translation of Professor Winckler's work, excellent though it was at the time of its appearance, may well be questioned, all the more since an English version had already appeared in 1903 as part of Helmolt's "History of the World." Why then do it again? The author, to be sure, has made numerous additions, but with the usual result of giving to the volume an unequal character, so that in part it reflects present knowledge, but in part also it is antiquated. This criticism applies more particularly to the first half of the book, dealing with the earlier and more obscure period of the history of the Euphrates Valley. With steadily increasing knowledge of this period, it is inevitable that for some time to come the history must be rewritten—not merely revised—every few years

It may have been too late for the author to avail himself of F. Thureau-Dangin's volume "Les Inscriptions de Sumer et d'Akkad" (see *Nation*, February 6, 1907), though the French edition appeared in 1905; but the editor could and should certainly have done so and have modified the names of some of the early rulers in accordance with present usage. Thus, instead of Urgur, the reader ought to have been given the form Ur-Eugur, which is now accepted as the reading of the founder of the Ur dynasty; and if Professor Craig thought it proper to retain such forms as Ungal-zaggisi and Ungal-si-kisal, he should at least have indicated in a footnote that these names are generally read Lugal-zaggisi and Lugal-kisalsi. Again, in connection with the dynasties of Ur and Isin, there should have been at least a note in an appendix to call attention to the data to be gleaned from a chronological list found at Nippur in 1889 by Dr. J. P. Peters, and published by Prof. H. V. Hilprecht last January; a list which, besides giving us the full line of the five kings of the Ur dynasty, together with the length of the reign of each, tells us that the dynasty was overthrown by rulers of Isin, and furnishes also the names of twelve of the sixteen kings of this dynasty—seven more than are named on page 53 in the volume before us.

Winckler was one of the first—if not the first—to question the correctness of the statement made by Nabonidus (the last King of Babylonia), who says in one of his inscriptions that Sargon—the great Semitic conqueror of Babylonia—ruled 3200 years previous. Winckler proposed to reduce this figure so as to bring Sargon down to about 2800 B. C., instead of 3750 B. C. His view has gradually commended itself to most scholars, and Professor Craig's note on page 32 pleading for the earlier date is particularly unfortunate in view of L. W. King's discovery (see the *Nation*, November 7, 1907, page 424) that the so-called first and second dynasties of Babylonia were contemporaneous and not successive, as was hitherto supposed. This in itself reveals an error of 365 years in Nabonidus's date and if one mistake of this nature could be made by the scribes, there is a fair presumption that other dynasties which the scribes counted as successive were also contemporaneous. Through King's recent work, to which reference has just been made, chapters vii. and viii. of the Winckler-Craig history need to be entirely rewritten.

In the chapter on the Cassites again, the valuable material for a view of internal conditions embodied in Prof. A. T. Clay's two admirable volumes, "Documents from the Temple Archives of Nippur, Dated in the Reigns of Cassite Rulers," does not appear to have been utilized either by the author or the editor, although these volumes appeared over a year ago. Among other things, Professor Clay's researches have shown that the ruler who followed upon Kadashman-Turgu was Kadashman-Enlil and not Kadashman-buriash, as is stated on p. 90. A more recent investigation of Professor Clay's, in which the proof is furnished that the chief deity of Nippur and one time head of the pantheon hitherto read Bel was pronounced Enlil, probably appeared too late to be utilized by Professor Craig; but this paper, which requires changes in the readings of most of the names beginning with Bel in the Index (p. 324), besides a recasting of numerous passages in the book, furnishes another illustration of the unwisdom of republishing a work written some years ago.

For the Assyrian and neo-Babylonian periods comparatively little additional material has been brought forward since 1899, so that the second part—covering, in fact, two-thirds of the entire volume—is fairly representative of our present knowledge. The time, however, is not far off when with the publication of the new material obtained by the German excavations at Kalah-Shergat—the site of Ashur, the ancient capital of Assyria—the early chapters of Assyrian history will also have to be rewritten. Craig on p. 180 refers in a footnote to this material, and it is therefore somewhat surprising that he should not have embodied the preliminary results as furnished in the *Mitteilungen* of the German Orient Society. The statement, *e. g.*, on p. 180, that Shamshi-Adad was the original builder of the main temple in Ashur should have been corrected by him in accordance with Professor Delitzsch's summary in No. 21 of the *Mitteilungen* (published in March, 1904), according to which Ushpia, who lived about four hundred years before Shamshi-Adad, was the first builder of the sanctuary.

Professor Craig, as translator, has done his work well. The translation reads easily, and Professor Winckler knows how to write in an interesting and frequently picturesque manner. His summaries of the chief traits of each period in the long history of the Euphrates Valley are admirable, and "The Historical Retrospect and Outlook" (pp. 127-164) is to be particularly commended though here, too, recent researches have not been used as they should have been. A valuable feature of the work is the copious and carefully compiled Index, which will greatly facilitate the use of the book. The work would, however, have been made still more serviceable to scholars if the author or editor had indicated the sources for the historical material embodied in each chapter—or, at all events, the main sources.

Autobiography of Oliver Otis Howard, Major-General United States Army. New York: Baker & Taylor Co. $5 net.

Gen. Howard is the last survivor of the Union leaders, who, during the Civil War, commanded independent armies. Going to the war as colonel of the Third Maine Regiment, after an honorable course at West Point, he directed a brigade at the First Bull Run; a division in 1862; the Eleventh Corps at Chancellorsville, Gettysburg, and Lookout Mountain; succeeded McPherson in the command of the Army of the Tennessee before Atlanta, in 1864; and finally led Sherman's right wing through Georgia and the Carolinas.

The record of this veteran will be welcomed. Our soldiers have often shown that they could write well. Grant's homely sense and strength are as obvious in his pages as in his campaigns; Sherman is full of fire and point; Sheridan, while simple and direct, has unexpected passages of sensibility and poetry; Jacob D. Cox shows always sound judgment and literary finish. On the other side, the books of Longstreet and J. B. Gordon are picturesque and thoroughly manly, while the frank and incisive criticisms of E. P. Alexander have high scientific value. Will Gen. Howard's memoirs take rank with such books as these? Hardly, we think. The volumes are much too diffuse: the twelve hundred large pages might, with advantage, have been condensed into six hundred; the rather clumsy sentences have rarely pith or pungency. It is a minor but marked defect, for which probably the publishers are more to blame than the author, that while there are eight portraits of Gen. Howard himself, and valueless fac similes of his commissions, there is not in the books a single map; and yet the detailed narrative is well-nigh unintelligible without maps. The student of military science will find other records more illuminating; for vivid pictures we must search elsewhere. Nevertheless, there are fine qualities, truthfulness, candor, the spirit of humanity. The absence of bitterness towards adversaries is noteworthy. To cite one instance, it was Howard's lot to be in close contact with Hooker almost from first to last. As Howard was a sincere evangelical Christian, Hooker's irregularities must have jarred upon him harshly. Howard often fell under the lash of Hooker's criticism, so notoriously unrestrained and often exercised, and Howard's promotion to the head of the Army of the Tennessee finally aroused so much Hooker's chagrin, that he forsook the service in disgust. Howard could not tell his story without speaking of Hooker at length, but there is nowhere acrimony.

In Howard's life one naturally turns with keenest interest to his conduct at the battle of Chancellorsville. There the Federal humiliation sank to its nadir, and Howard had an unfortunate place in the foreground. The recently published reminiscences of Carl Schurz have turned the attention of many to the story of that fatal field. That Carl Schurz has told what he believes to be true, and that he is well qualified to speak, no one will deny. As commander of a division of the Eleventh Corps he was a witness of the infatuation of Hooker as to the movement of Stonewall Jackson upon his right flank, and close to Howard before and during the terrible rout. Not to cite other testimony, if Carl Schurz is trustworthy, in that dismal time, while Hooker should bear the chief blame, yet Howard was strongly obtuse to indications of peril plainly apparent to Schurz and to many more. The world has believed that the commander of the Eleventh Corps, like the general-in-chief, was on that day curiously blind, and nothing which Gen. Howard now says in his elaborate account will suffice to dispel the belief. We cannot admit that he did, as he maintains, all that could be expected of a corps commander. He fell short, not in courage—there he was never lacking; but in the quick understanding of indications which were unmistakable. Let the reader compare the accounts of May 2, 1863, by Schurz and by Howard, and he will be convinced that the latter makes an inadequate defence of himself.

But Howard then was in important command for the first time. He tried that day his prentice hand. In his scores of subsequent battles, while no one will assert that his deeds were especially brilliant; he was always prompt, constant, intrepid, and generally judicious. Probably the most marked service of his whole career was the occupation, on July 1, 1863, of Cemetery Hill at Gettysburg. The credit for this cannot, we think, be taken from Howard; and though Meade, with wisdom probably, preferred Hancock to Howard for his second at Gettysburg, Howard's work made the victory possible. In the West he was adequate to every position into which he rose. Sherman, whose critical eye over his lieutenants was shrewd and merciless, always advanced Howard, commending his soldiership, and respecting, if not sharing, his austerity of conduct and unfeigned piety. Once when a company of generals were chaffing Howard on his Puritanic strictness, and pressing liquor upon him—"Let Howard alone," said Sherman curtly; "I want one officer who don't drink." As an independent commander Howard's first and probably most important achievement was the success at Ezra Church, near Atlanta, July 28, 1864. It is an interesting coincidence that in this sharp engagement Howard was confronted by his classmate and old personal friend, Stephen D. Lee, also on that day for the first time in independent command at the head of the old division of Hood, who had just been put in Johnston's place. To-day S. D. Lee, at the South, as O. O. Howard at the North, is the sole survivor of those who held independent commands.

In Reconstruction times. Gen. Howard played a part in the foreground as head of the Freedman's Bureau and of educational enterprises. Though not escaping accusation, he was not involved in the scandals of that period, but bore himself, according to Prof. W. A. Dunning, the authoritative and discriminating historian of that period, "almost uniformly with moderation and good judgment." Throughout his long life Gen. Howard has been serviceable in peace as well as in war, in an especial way a fervent but not fanatical exemplar of evangelical religion, all of which his autobiography makes plain.

Science.

THE APPEAL OF SOCIOLOGY TO BIOLOGY.

Heredity and Selection in Sociology. By George Chatterton-Hill. New York: The Macmillan Co. $4.50 net.

Janus in Modern Life. By W. M. Flinders Petrie. New York: G. P. Putnam's Sons. $1 net.

Sex Equality: A Solution of the Woman Problem. By Emmet Densmore. New York: Funk & Wagnalls Co. $1.50 net.

Sociological Papers, Vol. III. By G. Archdall Reid, W. McDougall, J. L. Taylor, J. Arthur Thomson, Patrick Geddes, A. E. Crawley, R. M. Wenley, W. H. Beveridge, G. de Wesselitsky, Mrs. Sidney Webb, and H. G. Wells. New York: The Macmillan Co. $3.25 net.

These four volumes have a basic element in common. To biology, as to a court of last resort, they make appeal, one and all, to substantiate their findings, and to validate their programmes in the realm of sociology. Chatterton-Hill impeaches our modern liberal-industrial civilization of biological decadence, and insists on the necessity of some integrating principle if disaster is to be avoided. Flinders Petrie discovers that we are likely to go to smash, because state socialism will atrophy individual variations, and thus leave natural selection a sorry lot of candidates from whom to pick a winning race. Densmore revamps the old appeal for sex equality, but bases it on the biologically adventitious nature of sex, while many of the essayists who contribute to the "Sociological Papers" expound various systems of eugenics, each protected under biological letters patent.

Chatterton-Hill's book consists of three parts. The first is an intelligent summary of the biological doctrine of heredity and germinal selection from the point of view of Weismann. De Vries's mutation theory, although mentioned, appears to be imperfectly assimilated with the main stream of exposition. In these first 173 pages there appear but two excursions into the field of sociology proper, one dealing with consanguineous marriages, and the other with the infertility of hybrid races. In both cases one would like to have the conclusions fortified with more abundant evidence than is offered.

Part ii. (pp. 177-417), devoted to social pathology, is scrappily constructed. Suicide, insanity, and syphilis are each in turn discussed as social factors, but the analysis and findings fail often to carry conviction. That the socially cohesive influence of the Roman Catholic and Anglican churches acts as a deterrent against suicide is hardly a scientific conclusion in which to rest. It seems, moreover, to be in violent contradiction to Westergaard's statistical table cited on page 185. Nor is there longer any particular novelty in the paradox that sanitation, hygiene, and advance in medical knowledge are keeping alive a lot of social undesirables who, from the racial point of view, were better dead. Thus on page 343 the author concludes from superficial analysis of vital statistics, showing a decrease in death-rates up to forty-five years of age and an increase in death-rates at higher ages, that "it is evident that the average standard of life among persons of forty-five years has diminished." A conclusion as to actual diminution is manifestly unwarranted, not to say, absurd. If fewer die in early years, manifestly more must die at maturity; and the higher death-rate at forty-five to fifty-five years (the increase being only from 19.6 to 20.8 in thirty years) is in part due to the fact that deaths now occurring between forty-five and fifty-five include many who in former times would have met an untimely end at earlier ages. Vital statistics, despite their seeming simplicity, are a slippery instrument for the inexpert to handle.

Part iii. (pp. 421-555), devoted to the actual conditions of social selection, is in essence a belated echo of Benjamin Kidd. The upshot of it all is that internal cohesion in any society is a prerequisite for social survival; that individualism as typified by the *laissez-faire* régime makes for social disintegration; that socialism would extirpate competition and thus would narrow the sphere of conflict on which progress depends; that science has no compelling voice in which to enjoin individual subordination to social needs; and that as a consequence a religion or its equivalent with suprarational sanctions is a condition necessary to secure survival in the world strife of nations. In arriving at this conclusion, Chatterton-Hill is needlessly repetitious. He goes out of his way to demonstrate the bankruptcy of liberalism; makes very unscientific, not to say ill-mannered, flings at the Nonconformist conscience (p. 375) and the Aborigines Protection Society. He contradicts himself in the matter of militarism, holding that war in the higher stages of civilization, including our own, "acts by the elimination of the fit" (p. 318); and is a "factor of inverse selection" (p. 320); and yet declares that "nations need war and conflict, not only to effect their expansion, but also to maintain a high level of superiority" (p. 478).

The general verdict on the volume must be adverse. Under competent tutelage, he has given a good résumé of the dominant biological theory of heredity. Left to himself, he has devised an inconclusive and inadequate analysis of social pathology, and has supplemented it with a rambling, unoriginal, and often self-contradictory disquisition on social programmes and social needs.

The title of Petrie's little book—"Janus in Modern Life"—is indicative of its thesis that nations must, like the Latin god, look to the past of history as well as to the future if they will learn by the mistakes of their predecessors. Himself a believer in the doctrine of biological selection, Petrie finds the line of national progress in the "remorseless 'scrapping' of poorer machines" (p. 85). Without more ado, he proceeds to a vigorous assault on schemes of a socialistic character, condemning them as lessening the variety of raw material on which natural selection may do its work. Many of his far-reaching strictures, such as those on workmen's compensation, old-age pensions, trades unionism under the Roman Empire, and the like, are little more than summary expressions of personal opinion. Their filiation to the biological doctrine of selection is very attenuated. The book must be accounted as a vigorous and readable *ex parte* presentation of the social views of a vivacious personality, but hardly a serious, certainly not a weighty, contribution to the study of society. It properly belongs to the Questions of the Day series, for it is nothing, if not ephemeral.

Densmore's "Sex Equality" is a curious blend of an older, *à priori*, doctrinaire equalitarianism and the more recent deference to the sovereignty of biology. The first was common enough during an epoch which has been vaguely described as "the Age of Gen. Grant." The second is, of course, everywhere in evidence to-day. But the combination of the two is unique. The older strata of the naïve teleological era peep out in appeals to "the intention in the original scheme of things" (p. 41), and in repeated misquotations of the Declaration of Independence, to the effect that all men are born or created "free and equal." But, as though realizing that a vague teleology of natural right will not, of itself, carry conviction to-day, the author invokes Darwin, Spencer, and Weismann as witnesses for the cause of sex equality.

The truth is that the biological question of the origin of sex, whether it is "an incident, dependent on the environment for its evolution" (p. 66), or not, is wholly irrelevant to the issue which Densmore raises of complete social, legal, and political equality of men and women. Nor does the author's extended recital of the eminent achievements of noted women suffice to determine the question. The opinion offered that when both "husband and wife engage in gainful work the burden [of maintaining the family] will be greatly decreased and earlier marriages will inevitably follow" (p. 213), is completely refuted by experience. The author's vision is simply clouded by his own obsession. Thus he asks with something like an air of expected triumph in his critique of Jordan (p. 366):

> But have we any ground for concluding that women who are fulfilling the functions of maternity are thereby excluded from exercising full mental and physical activities in other directions?

Most students of the subject would answer in the affirmative; to the author a negative is the only reply imaginable. Whatever be the ultimate disposition of the question of woman suffrage, public opinion at present seems disinclined to add to the burdens womankind now bear the onus of political responsibility. Should women themselves insist generally on assuming this additional function, it will doubtless be conceded; but their insistence must voice the deliberate choice of the sex, not merely the demand of militant individual suffragists.

In the "Sociological Papers" the persistently recurrent note is the action of biological selection in human society. Based on different versions of this selective process, various schemes of eugenics are propounded. Thus G. Ashdall Reid argues that as the germ-cell is practically unaffected by the environment, it follows that "we cannot improve races of plants and animals by improving the conditions under which they exist. Such a course benefits the individual, but results in racial degeneration. The race can be improved only by restricting parentage to the finest individuals" (p. 10). W. McDougall offers what he terms a practical eugenic suggestion, to wit, a government subsidy for the encouragement of the multiplication of the better human stocks, especially in the civil service. Some of the papers touch, it is true, on other aspects of sociology—its methods, for example, are discussed by Mrs. Webb and by H. G. Wells; and the origin and function of religion by A. E. Crawley—but eugenics has the centre of the stage very much to itself.

If it were not for the wholly admirable paper entitled "The Sociological Appeal to Biology," by Prof. J. Arthur Thomson of the University of Aberdeen, the four volumes under review might be dismissed with a tolerably comprehensive verdict of dispraise. But they are all vicariously redeemed by Professor Thomson's contribution. Fortunately he combines with a knowledge of biology an insight into the social heritage of civilized society. A student of society can no longer afford to be ignorant of certain great biological generalizations. But armed with these alone, and let loose upon social phenomena, he may become as misleading theoretically, and as dangerous practically as the veriest quack. Against this unscientific one-sidedness Thomson raises a timely protest. There is no warrant, he asserts, for "pretending that sociology is merely a higher department of biology, and a human societary group no more than a crowd of mammals" (p. 159). The law of selection must be "reverified and tested" for society. "Its biological form is one thing, its sociological form may be another" (p. 161). To assume a crude identity is to court "sociomorphic illusions." The Weismannian doctrine of the non-inheritance of exogenous, somatogenic modifications loses much of its alleged sociological importance "in view of the fact that man has an external heritage of custom and tradition, institution and legislation, literature and art, which is slightly or not at all represented in the animal world, which yet may be so effective that its results come almost to the same thing as if acquired characters were transmitted" (p. 165). The biologico-sociologists have thus been deservedly called to order by one whose biological equipment they cannot disparage. Not the least of Thomson's services is his dispelling of the gloom engendered by the crass transfer of biological theorems into the social domain. The haughty disdain with which various forms of social prophylactic and environmental reform have been pronounced misguided and abortive efforts of a mistaken altruism will now be abated. The elimination of weaklings which has been preached as the primary social duty will have to yield to counsels at once more benevolent and more truly scientific. The preacher of eugenics will have to assume a more modest mien now that it is borne home on him that he has an infinitely subtler effect to compass than can be learned off-hand from the stud-book of the cattleman. And not least grateful for deliverance will be those modest well wishers of their kind who, albeit unversed in technical science, will be strengthened in their belief—avowed only fearfully of late—that common-sense methods of social betterment have no longer to dread the condemnation of an unmasked sciolism, nor any longer to invoke the *imprimatur* of an exposed pseudo-science.

D. Van Nostrand Company announces a number of books as "in press," viz.: "Differential Equations," by W. J. Berry; "Electric Motors: Their Action, Control, and Application," by F. B. Crocker; "Handbook for the Care and Operation of Naval Machinery," by Lieut. H. C. Dinger; "Linseed Oil," by W. D. Ennis; "The Design and Construction of Internal Combustion Engines," by Hugo Gueldner; "Integration by Trigonometric and Imaginary Substitution," by C. O. Gunther; "Electricity in Mining," by R. W. Hutchinson, jr.; "A Laboratory Guide to Commercial Analysis," by R. L. Fernbach; "General Methods Used in Technical Analysis, Part I.," by C. A. Keane; "Design of Electrical Machinery," by A. Press; "Machine Drafting and Empirical Design," by Walter Rautenstrauch; "A New System of Architectural Composition," by J. B. Robinson.

As a piece of fine bookmaking, "The Natural History Results of the National Antarctic Expedition," published by the British Museum, compares favorably with the volumes of the "Challenger Expedition." Volume II., which treats of the vertebrates, mollusks, and crustaceans, is complete in itself and is issued at the price of £3. The material has been worked up in a most entertaining way, abounding in incident. The various whales and seals are described by Dr. E. A. Wilson. The most fascinating part of the work is that devoted to the emperor and king penguins. The habits and life histories of these rare creatures are fully described, with scores of photographs. The emperor penguin, standing over half as tall as a man, selects the darkest, most dismal months of the Antarctic year in which to breed. Not only does it never climb out on land, but it never even touches land-ice, spending the whole of its time on sea-ice. If its egg or chick should rest even for a short time on the ice nothing could prevent freezing, so the parent holds its one egg or solitary chick upon its broad webbed feet. A fold of loose skin hangs down and partly protects the offspring from the icy air. Week after week the parent sits thus, when weary or hungry shifting its charge to the nearest penguin, but soon returning to take up its duties. In spite of all, many young birds freeze to death, and their stiffened little figures, erect as in life, are pitiful sights. This report should be in every public library as unfolding the mysteries of a zone unknown to almost all of us.

The final edition of the first part of J. M. Hulth's "Bibliographia Linnæana," an advance edition of which was issued at the time of the celebrations in Upsala last year, has now been published, containing such revision of details as could be made without disarranging the bulk of the printed matter. More extensive alterations and additions have been reserved for a supplement. One must regret that the author has not numbered the various titles and references in the list, for a consecutive numbering of all the items would have greatly facilitated the use of the book.

The first astronomical observatory in Sweden was the one erected in Upsala in the year 1649, as Karl Bohlin tells in an address delivered by him at the annual meeting of the Academy of Sciences in Stockholm, on the first of April, 1907. Another address, delivered by Einar Lönnberg on the same occasion, and, like Professor Bohlin's, printed in the Academy's Year Book for 1907, is entitled "Ett blad ur Elefanternas Utvecklingshistoria," and offers within a short compass an interesting survey of what is known of the evolution of the type of the elephant from the earliest geologic periods.

Dr. James Bell Pettigrew, Chandos professor of medicine and anatomy in the University of St. Andrew's, has just died in his seventy-fifth year. Among his medical publications are "Arrangement of Muscular Fibres in Heart," and "Bladder" (1864 and 1866), and "Structure and Function of

"Valves of Vascular System" (1864). He was also a devoted student of aeronautics, writing on the subject, and experimenting persistently in flying machines.

Drama.

Scheme and Estimates for a National Theatre. By William Archer and Granville Barker. New York: Duffield & Co $2.50.

Although this work relates exclusively to the plans and cost of a National Theatre for Great Britain, it contains much that is of interest for those who are contemplating the possible establishment of a similar institution in this country. It will at least direct attention to the amount of detail to be considered and the labor to be performed before the enterprise could be put into practical working shape. Both Mr. Archer and Mr. Barker are well qualified for the task which they have undertaken, the one by his long study of dramatic literature and the art of acting in England and on the Continent, and the other by his experience as a dramatist, as an actor, and a producing manager. The bulky volume which they have compiled does infinite credit to their enthusiasm, their industry, their technical knowledge and their foresight; it discusses, with a convincing array of facts and figures, every step in the process of construction from the appointment of the first committee to the raising of the curtain on the opening night; prescribes, indeed, a compact and elastic organization, which could scarcely fail to operate successfully, if once started on the assumed conditions. But it is impossible to avoid the reflection that this elaborate edifice rests upon a foundation of hope rather than of rational expectation. As a matter of fact all that Messrs. Archer and Barker have done is to point out what may be accomplished if somebody will present a suitable site in central London, if somebody else will build and give the theatre—both site and building to be free from rent and taxation—and if other volunteers will contribute an endowment fund of $750,000. It is true that provision is made for the creation of a sinking fund for the repayment of donors in the event of the scheme's proving remunerative, but this plan is not likely to prove a great inducement to investors. It is not pretended that money grants may be looked for from either Parliament or the municipal authorities. The fate of the whole scheme apparently depends upon the number of rich men zealous in the cause of a national theatrical art.

But in the scheme itself there are admirable features worthy of note. Great care is taken to ensure the devotion of the proposed theatre to its legitimate purposes and to no other. The property is vested in a board of fifteen trustees, of whom one is to be nominated by each of the Universities of Oxford, Cambridge, and London, one by the Royal Academy, two by the London County Council, and nine by the original donors. In case of death, or resignation, vacancies would be filled by vote of the surviving members. The trustees are to appoint a director, and a staff—including a literary manager, a business manager, a solicitor, and a play reader. With the direct management of the theatre, the selection or production of plays, and affairs of the interior generally, neither the trustees nor the donors, are to have anything whatever to do. Executive control, subject to general regulations, will be entirely in the hands of the director and his staff, with the director supreme. The latter, of course, is removable by the trustees as a body, if they find him incapable. The regulations ordain that at least thirty different plays shall be acted every year, and that at least three different plays shall be presented every week. Of the performances each season one-fourth at least must be of the English classical drama, and one-third of the English and foreign classical drama taken together. Plays that have survived for one hundred years are to be accounted as classical. Not more than one-fifth of the performances may be of plays of foreign origin. American plays are to be counted as English. All these rules are sound, intelligent, and liberal. Sample programmes are given for an imaginary season in which the authors represented are Shakespeare, Pinero, Henley, and Stevenson, W. S. Gilbert, Congreve, Haddon Chambers, Molière, Wilde, Grundy, Sudermann, Sheridan, W. B. Yeats, H. A. Jones, Dumas, fils, T. W. Robertson, Brieux, Ben Jonson, R. C. Carton, Mæterlinck, Bulwer Lytton, Tennyson, Wills, and Frederick Fenn. This is a list against which very little exception could reasonably be taken considering the representative nature of the theatre. The absence of such names as Ibsen, Gorky, Björnson, Hauptmann, D'Annunzio, and Bernard Shaw denotes a prudent conservatism.

It would be useless to discuss the financial details, into which Messrs. Archer and Barker go with great minuteness, as they apply to England only, but the question of actors for an endowed national theatre, which must eschew long runs and everything that is merely sensational or popular, is one that is as vital here as anywhere else. Messrs. Archer and Barker profess to have no anxieties on this score, but their confidence in immediate results will not be shared by those most familiar with existing theatrical conditions. They say that upon careful inquiry they are convinced that they can assemble a company of some sixty players, capable of a worthy interpretation of the programme which they have outlined, without dependence upon high-priced stars. What they propose is to pay good, but not high, salaries, with an addition of a small special fee for each actual performance and a system of pensions after superannuation, regulated by length of service. They also promise furloughs to actors not in active employment. No doubt the certainty of a regular income would be a great attraction to players only in occasional demand at fancy prices, but this consideration has not been sufficient to stop desertions from the Théâtre Français and other European state theatres, and it is certain that the syndicate managers would offer powerful bribes to any player who could be converted into a star. F. R. Benson has had the best all-round stock company in England for many years—and has maintained it without subventions, by the sheer power of artistic purpose and achievement—but his most promising youngsters have been seduced from him continuously by London managers in need of a new leading man. One of the objects of a national theatre, of course, is to supply just such needs, but a constant leakage of this sort would be most perilous to a new organization unfortified by prestige. And it must be remembered that a national theatre company, to justify its existence, must be maintained at a high point of general efficiency.

Outside the companies of Mr. Benson and Oscar Asche, himself a Bensonian—and a few veterans—actors trained in the higher poetic and romantic drama are extremely rare. And this fact will constitute one of the most formidable difficulties which the promoters of the national theatre will have to overcome. Their plans include the establishment of a dramatic college as a feeder to the company, and the question arises whether it would not be wiser to start this first and begin rehearsals with the breaking of the ground for the new structure. Unless the early performances are a palpable improvement, artistically, upon any of the occasional revivals of recent years, the enterprise would suffer a shock from which it would recover with difficulty. The problem of the players is really the most difficult of all. Sites, theatres, and endowments may be readily provided, but no amount of money or good will can create a really representative company at a moment's notice.

Scribners have brought out a new edition of Professor Lounsbury's "Shakespeare as a Dramatic Artist," which, besides being cheaper than the original issue, is now made uniform in appearance with the other two volumes of the author's "Shakespearean Wars."

The production of "Electra"—an English version by Arthur Symons of Hugo von Hofmannstahl's German version of the Sophoclean drama—by Mrs. Patrick Campbell in the Garden Theatre is worth a note of record as a praiseworthy, honest, but not very successful effort. As a representation of ancient Greek tragedy, it was unsatisfactory to the classical student, not so much because of the unavoidable inaccuracy of the stage appointments or the radical modifications in the structure and dialogue of the piece itself, as because of the failure of the performers to suggest its antique spirit or interpret adequately its sombre and terrible emotions. None of them could supply the heroic carriage, the sonorous, measured, and pregnant utterance, or the large, free, significant gesture necessary to the dignity and grave portent of the scene. Mrs. Campbell herself, with her striking presence, was a picturesque figure as Electra, and had some fine moments of despair and passion, but she was far more impressive in repose than in action and never rose to any great height of tragic exaltation. The best performance, in respect of form and comprehension, was the Clytemnestra of Mrs. Beerbohm Tree.

There was not much of the actual Balzac, but more than a faint reflection of his spirit, in "The Honor of the Family," which was produced in the Hudson Theatre on Monday evening. It is an English version, not too skilfully made, by Paul Potter, from "La Rabouilleuse," which is in turn an adaptation by Emil Fabre from "Un Ménage de Garçon." The piece does not belong to the highest type of romantic melodrama, but is well made theatrically and is uncommonly strong in characterization and succession of lively incident. In the hands of a first rate company, accustomed to romance, it would prove exceedingly effective. In this case the only really romantic acting is supplied by Otis Skinner, who furnishes a remarkably picturesque, humorous, and vital impersonation of the masterful Bonapartist Colonel, Philippe Bridau. He is one of the very few actors capable of conceiving an eccentric personality of this sort and giving it plausible embodiment. His impersonation is particularly welcome at a time when the stage is occupied, for the most part, by a dull and deadly realism.

The new Irish drama is not altogether unknown in this city, but the Irish National Theatre Company was represented here for the first time on Tuesday evening, in the Savoy Theatre, when three of its prominent members, Bridget O'Dempsay, W. G. Fay, and F. J. Fay, appeared in W. B. Yeats's "A Pot of Broth." On the programme this was described as a one-act comedy, but actually it is only a sketch in a folklore notebook, undramatic in form and quality. It simply shows how a blarneying beggar procures a dinner at the expense of two credulous peasants, by bragging of the alleged virtues of a wonder-stone by which hot water is turned into good soup. The humor of it is rather thin, but conveys an impression of absolute veracity. There is not the least suggestion of the theatre about it. The actors, indeed, seemed purposely to avoid any expedient that might savor of the footlights, playing more like amateurs than professionals. To the ordinary theatregoer, accustomed to the stage Irishman, this representation will seem to have little point or flavor, but the more discerning observer, noting the perfect realism of the cabin and its fittings, and of the costumes, manner, and speech of the actors, and the natural but not altogether trivial dialogue, will realize that this is a distinctly national product, characteristic of race and country, and therefore possessing a special artistic value.

The first play which Mme. Vera Komisarzhevsky will present in New York in her engagement of five weeks, beginning on March 2, is Ibsen's "A Doll's House." It is her intention to give ten plays, the majority of which have never been seen before in this country and she will give two of them each week. In the first week, besides "A Doll's House," she will produce "The Fires of St. John," by Sudermann.

Ben Greet has recently added to the repertory of his company dramatizations of several of the tales in Hawthorne's "Wonder Book." These include "The Mysterious Box," "The Golden Touch," and "The Miraculous Pitcher," all of which have been received with great favor, especially by the children for whose benefit they are chiefly intended. Mr. Greet's list of comedies, this season, includes "She Stoops to Conquer," "The School for Scandal," "The Jealous Wife," and "The Critic." In the spring he expects to give "Comus," with Lawes's music, to celebrate the three-hundredth anniversary of the birth of Milton.

Music.

Chats with Music Lovers. By Annie W. Patterson. Philadelphia: J. B. Lippincott Co. $1.25 net.

Half-Hour Lessons in Music. By Mrs. Herman Kotzschmar. Boston: Oliver Ditson Co.

Counterpoint Simplified. By Francis L. York. Boston: Oliver Ditson Co.

Analytical programmes are frequently written which are intelligible only to those concert goers who do not need them; and readers of books on musical topics are often disconcerted by technicalities, many of which are needless. The author of "Chats with Music Lovers" has evidently made a conscious effort to avoid that sort of thing; being a "Mus. Doc., B.A., Royal University of Ireland," she could no doubt have written as learnedly as any of them, but she has preferred to make her pages intelligible to all; indeed, she has gone to the other extreme. The object of her book is to give advice to those who want to know how to enjoy music, how to practise, how to sing, how to compose, how to read textbooks and prepare for examinations, how to get engagements and appear in public, how to conduct, to play the organ, to teach, to organize musical entertainments, to publish music. To each of these topics a chapter is devoted, replete with sound, practical advice to beginners. Nor will advanced students fail to find here and there a point of value. On the subject of nervousness, for instance, which afflicts many mature and famous artists, the author cites the advice of a revered master: "Look upon the listeners as so many cabbage heads," and adds:

> The best safeguard against nervousness is to throw one's self so thoroughly into the interpretation of the work undertaken that surroundings become as if they were not.

Concerning programmes the author has sensible things to say. She maintains that they are generally far too long, and believes that if they were reduced so as to provide no more than an hour of music the masses would be tempted to attend what now they avoid, and good music would become as popular as good fiction. Débutantes, in particular, should understand that "the effect they produce is often in proportion to the length of the solo selection given; *i. e.*, the less we hear from them the more we would like to hear." The most difficult step in the career of an artist is the securing of the first engagement for a public appearance. The author's advice is that the pupils should prepare as many oratorio and operatic parts as possible under the guidance of a competent teacher. It often happens that an eminent singer becomes indisposed on the eve of an important performance. This is the débutante's chance. Mary Garden began her operatic career that way, becoming famous overnight.

Mrs. Kotzschmar's book is written in a style still more simplified. It consists of a series of twelve lessons for those who are called upon to teach children. The author's aim has been "to see from the children's point of view, and to explain and illustrate things musical in a way that would appeal to their imagination as well as reason." She has found children naturally enthusiastic and optimistic, and has aimed to preserve and intensify these traits by the manner of presenting information, resorting to pictures, jokes, and other things the little ones like. Experience has convinced her that for all foundational study, class work is superior to private, because it gives the children the advantages of companionship, comparison, and competition. Details about the lives of great composers are deftly interwoven into the lessons. An occasional statement may be questioned. It is not true that Bach "was always poor." He had for a time an income equal to $3,000 to-day. To be sure, his family numbered twenty children.

Simplification is also the keynote of the third book on our list. Mr. York does not assert that he has discovered any new principles in counterpoint. He has merely attempted to put the old well-known principles of strict counterpoint in as convenient and concise a form as possible, and it must be admitted that he has succeeded very well. His definition of counterpoint as "the art of so writing two or more melodies that they may be satisfactorily performed at the same time," is a good sample of the lucidity which prevails throughout the book—a trait sadly missing in some of the larger treatises on the art of weaving together voices. Of the sixteen chapters in this volume fourteen are devoted to "strict" counterpoint, the last two being concerned with "free," or "composers," counterpoint, in which unprepared dissonances are permissible and the movement of the voices is determined largely by chords.

A short biography of C. A. Debussy, the composer of "Pelléas et Mélisande," by Mrs. Franz Liebich, is announced for immediate publication by John Lane Co. Besides a full discussion of this opera, the book will contain a chronological list of Debussy's works, including several in preparation. In connection with this may be mentioned a special souvenir edition of Maeterlinck's "Pelleas and Melisande," with illustrations from the opera and a critical Introduction by Montrose J. Moses, to be published by Thomas Y. Crowell & Co.

England has frequently given great singers to the world, but seldom first-class instrumentalists. It is therefore worth noting that there are in our concert field this year three such, a violoncellist and two pianists. The violoncellist is May Mukle; at the last concert of the Russian Symphony Orchestra she played a concerto which made a famous musician exclaim "Gerardy is an artistic infant compared to her!" Her tone is extraordinarily big, beautiful, and varied; her *aplomb* is amazing, and all her instincts are genuinely musical. Of the pianists, one, Harold Bauer, has been a frequent visitor in this country. He was doubly welcome this time because he was the first foreigner of note to play MacDowell's "Eroica Sonata" in public here. The other pianist, Katharine Goodson, was heard last year in chamber music, but as a soloist she has only just now revealed her powers. Her art is much like that of May Mukle—ardent, impulsive, emotional, yet always sane and avoiding extravagance. These three artists indicate that English musicians are at last succeeding in breaking through the British stoicism which has so long tabooed and hindered emotionalism, the very essence of the tonal art.

The annual Wagner concert of the New York Symphony Society, under the direction of Walter Damrosch, will be given Saturday evening at Carnegie Hall, with the usual repetition on Sunday afternoon. The feature of the programme will be the appearance of Mme. Nordica as soloist. Among other numbers she will sing Isolde's "Lament over Tristan's Body" and the "Liebestod." This will be Mme. Nordica's first concert appearance this season. The orchestra will play three early overtures of Wagner. They are an overture to "Christopher Columbus," to be played for the first time in America; overture to "Rienzi," and overture to "Tannhäuser."

Wagner has more than twice as many performances in Germany as any other composer. The figures, compiled by Breitkopf & Härtel, give him, for the season 1906-7, 1,710; Lortzing comes next with 725, followed by Verdi with 721. Bizet had 530, Mozart 514, R. Strauss 291, Mascagni 281, Leoncavallo 252, Beethoven 187, Humperdinck 158, Meyerbeer 144. But no grand opera was able to compete with "The Merry Widow," which was sung 2,932 times.

Art.

Le Origini Della Architettura Lombarda. By G. T. Rivoira. Vol. II. Rome: Loescher & Company.

In 1901 Signor Rivoira published the first volume of a treatise to which, for years to come, all scholars must refer when considering any important monument of Lombard architecture. In the uncertainty which still prevails in many quarters as to the origin of what is popularly known as Romanesque architecture, whether its inspiration came from France or from Germany, or from Italy, from Constantinople, from Syria, or from Persia, Signor Rivoira raises a clear bugle call in defence of the Italian origin of all its essential features. So sure is he that this type of architecture was not merely founded upon Roman tradition but developed first within the boundaries of Italy (at Ravenna and in Lombardy), that he discards the word Romanesque as being for his purpose too vague and comprehensive. His first volume was concerned with the origins of Lombard architecture: first, at Ravenna, where all the characteristic elements appear at an earlier date than in Constantinople; and secondly, in Lombardy, where Roman and Ravennese traditions long survived.

This second volume traces the spread of Lombard architecture to France, England, and Germany. It is here that Rivoira's strength makes itself felt. To do full justice to his work would require far more time and special consideration than is possible for us to give; but we may, nevertheless, even in a brief review, point out some of the chief merits and defects. Rivoira attacks his subject with a double axe, one edge of which is historical and the other archæological. He has grasped more fully than most historians of architecture the human element which enters into ecclesiastical foundations. Thus, Guglielmo di Volpiano looms up as an important figure because of his foundations at Dijon, Fécamp, Jumièges, Rouen, Bernay, and Mont Saint-Michel; and Lanfranco di Pavia, because of his foundations at Avranches, Bec, and especially at Caen. Rivoira's quest for founders and restorers of churches has led him beyond the field of strictly architectural literature to the sources of mediæval history, which he has evidently studied to good purpose. His dates, of which there are many, are drawn chiefly from documentary sources. Moreover, he proves himself a careful observer of architectural forms and a keen student of their affiliations. He describes in detail every monument of which he treats. This succession of descriptions may not be interesting for continuous perusal, but is most important for reference. These descriptions are illustrated by some 650 photographic reproductions. Ground plans, however, are notably absent. Rivoira has, too, an uncommonly keen eye for sculptural details. From an æsthetic point of view, pre-Lombard capitals and decorative sculptures exhibit, in most instances, such helpless incompetence as to tempt a historian of art to pass them over in silence. Not so with Rivoira. He distinguishes between the degrees of incompetence displayed with the same attentive care that a parent might give to the first efforts in modelling made by an only child.

To most readers the discussion of the ribbed cross vault will appeal as a novel but most reasonable solution of that vexed problem. If Rivoira's dates are trustworthy, it is not to the Ile-de-France in the clumsy ribs of the ambulatory at Morienval (1120-1140), nor to England in the heavy ribbed vaults at Durham (1093-1133), that we must look for the earliest ribbed vaults. Italy, as we might expect, furnishes earlier examples, not, it may be, at S. Ambrogio di Milano (1088-1128), or at S. Michele di Pavia (circa 1117); but certainly in the church at Rivolta d'Adda (1086-1095), and in still earlier examples in the Cathedral at Aversa (1049-1056), and at S. Flaviano di Montefiascone (circa 1032). These churches show that under Lombard influence the ribbed cross vault was, during the course of the eleventh century, represented in widely separated towns in Italy.

Another striking feature of the book is the boldness with which the author mentions the first appearances of specific architectural features in France, England, and Germany. Of such claims we have noted twenty for France, and no less than thirty-two for England. Thus, for example, the first appearance in Great Britain of the front porch, of buttresses, of square transepts, and of the rood screen occur at St. Pancras, Canterbury, where they were introduced by the Roman monk, Augustine. Rivoira also believes that the first appearance in England of the rectangular presbytery was at Lyminge (965); of a Latin basilica with a central tower, at St. Peter's, Westminster (1080); of double transepts, at the Cathedral of Canterbury (1093-1130); of blind arcades as decoration at the base of walls, at Winchester Cathedral (1079-1093); and of cylindrical piers in the nave, at Malvern (1085). It is not to be expected that all of these claims will bear the test of time, but they should at least stimulate investigation; and the young student would do well to schedule them for purposes of study.

It must be said, however, that the method which the author pursues of describing a succession of monuments, even though they be grouped into schools, makes it rather difficult to find what the title leads us to expect, namely, discussions of the origin of specific architectural forms. Having apportioned himself no chapter for such topical consideration, Signor Rivoira is always tempted to present some historic vista when describing a particular monument. Even the indexes present only a list of monuments, arranged chronologically and alphabetically. If we wish, for example, for some account of thrust and counterthrust in vaulted buildings, we must search for it until we reach the discussion of Charlemagne's Chapel at Aachen. If we are interested in the origin of bell towers in the western façades, we hit upon it in the description of Gernrode. Even the important discussion of the ribbed cross vault follows the description of the Abbey at Cluny. The book is already unwieldy as to size, but a topical index directing the reader to these scattered discussions is a practical necessity.

In reading through these splendid volumes we of the north of Europe and America are led to feel how all roads lead to Rome, especially in mediæval architecture. Rivoira is at heart a patriot, and his book carries to its extreme the theory of the Italian origin of European architecture of the early Middle Ages. Doubtless Italy furnished the dominating influence. But we need not forget that the Orient throughout this period solved many architectural problems in the same way, and that one who is not at the same time an Orientalist and a European archæologist can hardly determine questions of priority. The beginnings of Roman architecture are certainly to be sought in the older civilizations of the East, but the development for the specific requirements of mediæval life in Europe may well have gone on without much help from the East.

For the "Collection of English Furniture of the XVII. and XVIII. Centuries," now exhibited at the Tiffany Studios, a catalogue has been prepared by Luke Vincent Lockwood, which, with its plates and text, will have value for collectors apart from the present occasion. The specimens of furniture were originally brought together by Thomas B. Clarke.

One of the finest specimens of book making recently produced in Germany is a work, prepared under the supervision of the Grand Duke Carl Alexander of Saxony, entitled "Die Wartburg: Ein Denkmal deutscher Geschichte und Kunst." The account of the famous Wartburg, a national shrine of Germany, is here given in fourteen monographs, historical, descriptive, artistic, etc., with 706 pictures in the text and 54 full-page illustrations, in copper engraving, woodcut, heliograph, and color (Berlin: Historischer Verlag Baumgaertel). The contents, both letterpress and illustrations, are the work of specialists and skilled artists. Price 260 marks.

The French Archæological Institute in Athens announces an important discovery made in Delos: a vast hypostyle hall covering an area of 1,840 square metres. On the front was a Doric portico facing the harbor; within, surrounding the hall, was a row of Doric columns, which was followed by another row of higher columns; in the hall itself were nine more rows of five columns each; the whole central part of the building was raised. The plan of the building, which is to be dated about 111 B.C., suggests a Roman basilica, of which indeed it appears to be a direct predecessor. At all events this style of architecture is foreign to classical Greece and was probably derived from the East.

The museums of Berlin have recently purchased a remarkable collection formed in South Russia of minor antiquities of all periods. In the Antiquarium have been placed the Greek and Græco-Roman product, as well as the half barbaric specimens from the Black Sea, which have hitherto been only meagrely represented. They consist of jewelry, chiefly gold; glass; well-preserved wooden ornaments of coffins; low reliefs in colored stucco, among which are three groups of Niobids; terra-cotta vases and figurines; bronzes. Among the Gothic finds which have been placed in the Museum für Völkerkunde, the most important piece is a bronze crown covered with gold, on which are mounted red stones. The other objects are a gold mounting for the sheath of a sword, a series of massive gold bracelets and other ornaments, fibulæ, and buckles. The rest of the collection has gone to the Islam collection of the Kaiser Friedrich Museum. It contains Syrian glass from the Caucasus and gold jewelry from a tomb in Tiflis.

The Giornale d'Italia states that the cathedral of Spoleto threatens to become a ruin owing to a gradual sinking of the slope on which it is built. A special commission has examined the building, and has drawn up a report to the Ministry of Public Instruction, suggesting measures necessary for its preservation.

The fourteenth annual exhibition of the T Square Club and the Philadelphia chapter of the American Institute of Architects will be held at the Pennsylvania Academy of the Fine Arts, April 13 to May 3. The Walter Cope Memorial Prize will be awarded for designs for a monument at the entrance of the harbor of Philadelphia. The jury of selection and award for the exhibition consists of Thomas M. Kellogg, C. L. Borie, jr., John Molitor, Frank Miles Day, William A. Delano, E. W. Donn, jr., Charles Grafly, Albert Kelsey, George Spencer Morris, Philip Sawyer, and Clarence C. Zantzinger; the hanging committee, of Paul P. Cret, Edward A. Crane, M. Edmunds Dunlap, James P. Jamieson, Gustav Ketterer, William W. Sharpley, and Stanley Yocum.

The interest in art in Canada is indicated by the formation of a Canadian Art Club, which is holding its first annual exhibition at Toronto. The members are: W. Edwin Atkinson, Archibald Browne, Edmund Morris, and Curtis Williamson, Toronto; Franklin Brownell, Ottawa; James Wilson Morrice, Paris; Horatio Walker, New York; and Homer Watson, Dover. Mr. Watson is president; Mr. Wilson secretary, and D. R. Wilkie, honorary president. The exhibitors, in addition to the members, are William Brymner, Maurice Cullen, and Robert Harris of Montreal.

An exhibition of handicraft jewelry will be open at the rooms of the National Society of Craftsmen, No. 119 East Nineteenth Street, till February 22. Among the exhibitions at the dealers' galleries are Indian paintings by E. Irving Crouse and portraits by André Brouillet, M. Knoedler & Co.'s, February 21; modern Dutch paintings, Arthur Tooth & Sons, February 22; pictures by Paul Cornoyer, Powell's, February 22; paintings by Gifford and Reynolds Beal, Bauer-Folsom's, February 29; and portraits by old masters, Ehrich's, March 5.

At an auction at Christie's in London, February 1, the following prices were paid for paintings: E. Long, Pharaoh's Daughter Finding Moses, £441; A. Cuyp, Hilly Landscape, with horsemen on rustic bridge and peasants driving cattle, £588; Frozen River, with sledges and numerous figures, £273.

The Trust Movement in British Industry: A Study of Business Organization. By Henry W. Macrosty. New York: Longmans, Green & Co. $2.50 net.

Mr. Macrosty here gives us an admirable survey of the combination movement in Great Britain. He uses the word Trust as a general term applicable to all forms of combinations. Description, rather than criticism, is the purpose of the book, but the concluding chapter presents the author's conclusions.

Combinations of one kind or another have been attempted in a large number of British trades: in the coal and other extractive industries, in the manufacture of iron and steel, in various textile industries, in grain milling, in the chemical industries, in the tobacco and liquor trades, in transportation, in retail trade, and a number of other industries. They have followed three main lines of development: "Integration, or vertical combination, as in the iron and steel industry"; "amalgamation, or horizontal combination, as in the textile industries"; and "terminable associations, as in the retail trades." The process of integration in the iron and steel industry has arisen from the fact that the cost of finished products can be reduced by utilizing some energy which otherwise goes to waste in the earlier stages of production. Horizontal amalgamation is the most common form which combinations take, and this is found in various industries besides the textile. Mr. Macrosty thinks it is due to "destructive competition," but finds that it is not progressing as rapidly as it progressed six or seven years ago. Terminable associations are very common, but, outside of the "shipping conferences," seldom result in anything like permanent control over prices.

Combinations of competing firms, however formed, have little control over prices in a free-trade country, and Mr. Macrosty finds that "there have been very few complaints of price extortion." Instead of seeking temporary gains by a great increase of prices, British combinations must look to their permanent interests; and thus are thrown back upon the policy of strengthening their position as producers. Unless they can show that they have the cheapest and best modes of production, they are, says Mr. Macrosty, sure to fail; and, he adds:

> It is our good fortune that this problem is being worked out in Britain free from complications of tariffs or secret railway agreements.

Concerning the relation of the British combinations to the welfare of the country, Mr. Macrosty speaks with due scientific reserve. He sees possible dangers, but can see also great possibilities for good. The case is radically different from that of the American Trusts, because in Great Britain combination has not been fostered by a protective tariff or railway discriminations. The problem seems to be that of "the modification of society by a new organization of industry, a more efficient method of production, evolving normally without artificial stimulus." Under such conditions, as Mr. Macrosty suggests, it may well be that "patience, not hostility, is the proper attitude."

Under the auspices of the State Banking Department the trust companies of New York city are now issuing weekly statements. There is no law which compels weekly statements by any financial institution. What has been known for half a century as the "New York Bank Statement" is a purely voluntary publication by the banks in the New York Clearing House. In some large cities, such as Chicago, no weekly reports are made. Until 1905, the trust companies of this State were subject only to the requirement of semi-annual reports on January 1 and July 1. In April of that year, the law was amended so as to prescribe that "the superintendent shall, at least once in three months, designate some day therein in respect to which the report shall be made." Under this authority Superintendent Kilburn called for four reports each year, at irregular dates; Superintendent Williams has required reports every Saturday. Undoubtedly the new system of publicity will help the trust companies Persistent secrecy, where the confidence of the public has to be retained, has always reacted on those who practise it. This is one reason why stocks and bonds of railways, which make full and frequent reports

of earnings, are so much more in favor with investors than securities of industrial companies which do not make adequate reports. Publicity of earnings is certainly one important reason for the support which Steel Corporation securities have had from the public. The copper trade and copper securities of this country have never freed themselves from the suspicions justly created when the ill-advised "insiders," three or four years ago, suppressed the monthly figures of production. The iron trade is undoubtedly injured in the public view, at times of reaction, by the still more recent suppression of the customary returns of unsold stocks of pig iron on hand. With financial intelligence diffused as it is today, all such efforts to deprive the investor of reasonable light are sure to provoke suspicion. It is not impossible that this principle had some part in the fright of depositors over the trust companies last October. If so, that particular cause need never recur.

NEW NOVELS WORTH READING

Barron's The Lost Goddess

A story of love and adventure concerning some modern New Yorkers and the perils of their search for a beautiful girl at the headwaters of the Amazon. $1.50.

Ellis's Arkinsaw Cousins

A story of the Ozarks. Will appeal very strongly to those who like a humorous, life-like story of American village life. $1.50.

De Morgan's Somehow Good

By the author of "Alice-for-Short" and "Joseph Vance." $1.75.

"A book as sound, as sweet, as wholesome, as wise, as any in the range of fiction."—*The Nation.*

"If you love your Thackeray, you may chance it safely enough—and have your reward. If you know Joseph and Alice you do not need to be told anything more."
—*N. Y. Times Review.*

HENRY HOLT & CO 29 W [illegible] NEW YORK

George Villiers
FIRST DUKE OF BUCKINGHAM
and Some Men and Women of the Stuart Court
By PHILIP GIBBS
No. 29 in The Memoir Series

20 Illustrations *$3.50 net*

This book is the life of George Villiers, the first Duke of Buckingham, whose personal beauty, courage, natural gallantry, elegance, and charm made him the favorite of two monarchs, dazzled the eyes of his contemporaries, and commend him strongly to all lovers of the romantic, the daring, and the adventurous in character. It is also a splendidly colored and dramatic picture of the court life of the period.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 27, 1908.

The Week.

That President Roosevelt must be vexed and scandalized by the open use of Federal offices to promote Taft's nomination, is clear to every one familiar with his principles and his record. To show how flatly the practice of his unruly subordinates is at variance with the convictions and pledges of their chief, we need not stop with Mr. Roosevelt's recent letter to Mr. Foulke. For the true Roosevelt doctrine, we have only to go back to the reports of the United States Civil Service Commission when Theodore Roosevelt was a member. One passage, in particular, states the correct position with such vigor that we could wish it were printed in capitals and nailed up over the door of the President's office. It occurs in the annual report for 1890-1891:

> The public service should be divorced from politics. . . . *No Government office* should be used to control the results of any elections whatever, whether it is an election for State or Federal officers, *or a primary, held for the purpose of electing delegates to a nominating convention*. . . . No officeholder belonging to a dominant party should act in any way which would cause a scandal or create friction in any office if the person belonged to the party in opposition. Under the spoils system, the theory is that politics belong especially to the officeholders. Under the merit system, the theory is that politics belong to the people, and that the people are quite capable of managing their own affairs *without interference and dictation* on the part of those whom they have chosen to serve the whole public in *merely administrative positions*.

This being President Roosevelt's own utterance, and so eternally true, it is easy to understand the exasperation with which he must view the unconcealed activity of Federal officeholders in many parts of the country in the interest of Secretary Taft. In Missouri, for example, specifications and names are not lacking. The *Howell County Gazette*, published at West Plains, gives an account of the proceedings in the convention of the Fourteenth District. "The first man on the scene was Grant Gillespie, an assistant in the office of District Attorney Sager at St. Louis.' Then there were postmasters thick as the leaves in Vallombrosa: A. T. Hollenbeck of West Plains, Charles W. Ferguson of Willow Springs, E. W. Flentge of Cape Girardeau, William Kitchen of New Madrid, C. A. Crow of Caruthersville, J. F. Palmer of Pomona, Postmaster Melvin of Bronson. Such a list can but cause the President grief mingled with anger. Moreover, his strong aversion to "interference or dictation" in politics by any one in an "administrative position" makes it plain that a vast amount of lying has been done by Washington correspondents. Here, for example, is a Washington dispatch to the Omaha *Bee*, asserting the most unblushing interference and dictation by one in an administrative position:

> The President bore down upon the proposition that Nebraska must be lined up for Secretary Taft. . . . He left no doubt upon the minds of Senator Burkett or Mr. Hammond as to his wishes for Nebraska, and he requested the two gentlemen to see to it that Nebraska sends a delegation unqualifiedly in favor of Secretary Taft.

Mr. Roosevelt would be the last man on earth to attempt dictation of that kind He will surely abide by his original doctrine. It was absolutely sound; and only a person whom we should hesitate to characterize would venture to assert that it was, as the Scotch elder said of the sermon, "*all* sound."

At Chicago on Saturday Gov. Hughes was more impressive than in his address to the Republican Club of this city on January 31. There was, too, an uncommon literary skill in the Governor's speech. It was not simply that his thought was clear and his language well chosen, but that the desired shadings and contrasts were so precisely conveyed. Gov. Hughes is attacking no one, comparing himself with no one, setting up no policies of his own as novel discoveries; yet the net impression of his speech is to put him before the country in a light and a position all his own. He is for vigor, but it must be disciplined vigor. He is for action, but it must be preceded by investigation to ascertain the facts. He would resolutely attack public evils, but they must first be delimited. Whatever the political effect of his speech, it will remain a model both in substance and presentation. In Gov. Hughes, it is plain, we have no addition to

> —the breed of such
> Who think too little, and who talk too much.

President Roosevelt is quite within his rights, and it may be his duty, to direct the Interstate Commerce Commission to inquire whether prevailing conditions in the railroad business justify a reduction in the wages of employees. If there is to be a clash between the men and the companies, it is well that the facts in dispute should be in hand. But the President went far beyond this in the letter which he made public last week. In it, the business world will read all kinds of vague threats and possibilities of further interference for political reasons. And the implication that no reduction of wages is to be tolerated in the case of a railroad that has a "bad past"—"past financial or other operations," is the President's language—is reckless. The President himself has distinctly, in his Indianapolis speech and elsewhere, renounced all idea of opening these closed chapters in railway finance. Secretary Taft has emphatically done the same, in his own name and the President's. Besides, Mr. Roosevelt has put himself on record as believing that there exists to-day substantially no over-capitalization in American railways. If the President had confined himself to the one point whether "the loss of business is such that the burden should be equitably distributed between capitalist and wage-workers," he would have been on firm ground. It needs no heaven-sent Commission to ascertain the facts. They are writ large in diminished railway earnings, reduced or passed dividends, and idle cars. If the wages of employees were successively raised, as they were, in the years of prosperity, they inevitably fall in times of adversity. All but the blind can see that we are in for a period of lower prices. With profits everywhere lessened, volume of traffic lowered, and salaries reduced, it is inevitable that wages must come down temporarily. We are all in the same boat. Whoever may be or may not be to blame for the misfortunes that have overtaken the country, all of its citizens must take their part. It is no time to attempt to set up a privileged class, even if they call themselves labor unions and boast of their political power.

We are reassured by the statement of Mr. Gompers that the trouble with our Supreme Court is not so much its lack of legal learning as its failure to inform itself on "modern economics." Characterizing as "mediæval" the doctrine on which the court decided the celebrated "hat cases," the president of the American Federation of Labor proceeds to illustrate his own notions of "modern economics." One postulate is that a labor union is not a Trust, because "there cannot be a Trust in something which is not yet produced." The Standard Oil, then, would not be a Trust if it disposed of all its oil on hand and possessed merely control of sources of production and means of obtaining a practical monopoly of future orders. That the union does try to make itself the only source from which employers can obtain skilled labor does not constitute, to him, a point of similarity. This is exactly like the quibble by which it is attempted to defend the boycott while denouncing the blacklist. The *Ameri-*

can Federationist has changed the phraseology of its "We don't patronize" list and now says mildly:

> It should be borne in mind that there is no law—aye, not even a court decision—compelling union men or the friends of labor to buy, etc.

The real question is not how the list is phrased, but how it is interpreted in practice. If it is, in fact, the means for setting in motion complicated and far-reaching agencies of coercion, and this fact is thoroughly understood in the unions, then it would not matter if it were headed "A list of the firms which have the most beautiful flower-beds in their factory front-yards."

Monday's decision of the Supreme Court of the United States that State regulation of the number of hours a woman may spend in mechanical labor is in accordance with the Constitution, is of vast importance. The issue presented was simple. In 1903 the Legislature of Oregon passed a law providing that "no female [shall] be employed in any mechanical establishment or factory or laundry" "more than ten hours during any one day." Curt Muller, a laundryman of Portland, brought suit to have the law declared unconstitutional, as violating the Fourteenth Amendment. The Oregon Supreme Court decided that the State possessed the power to fix the hours of women wage-earners as a police regulation, and that by so doing it did not infringe the liberty of the citizen to purchase or sell labor. The Federal Supreme Court has upheld this decision. An adverse ruling would have invalidated nearly all our State statutes limiting the hours of adult women. Nineteen of our States and all the leading countries of Europe have passed such laws. The consensus of public opinion the world over is that such regulation protects the public health. While women should have the right to choose their own employments and the working conditions that suit them, the progress of civilization demands that they be saved from over-exertion or from unsanitary surroundings that tend to incapacitate them for family life. Here, again, an abstract question of personal liberty has had to give way before considerations of national welfare. Justice Brewer, who read the opinion, went so far as to say of the woman wage-earner that "legislation designed for her protection may be sustained even when like legislation is not necessary for men, and could not be sustained." If this looks like legal favoritism shown to one sex, Justice Brewer replies that the difference in the physical strength of the sexes and the maternal functions of women necessitate special legislation for their safety "from the greed as well as the passion of man." This decision is not only just in morals, but is sound from the economic point of view. The Industrial Commission of 1900 laid great emphasis upon the fact that "permanent industrial progress cannot be built upon the physical exhaustion of women and children." Again, the shorter workday for women has resulted in a much more equal distribution of work throughout the year, especially in the so-called season trades. Employers who formerly overworked women at one or two seasons and then instituted part-time at the dull periods have been compelled to greater foresight, with the result that their labor is more efficient and contented, and that they have actually saved money.

If, as newspaper correspondents assert, Senator Aldrich is willing, rather than sacrifice the railroad-bond feature of his currency bill, to accept the amendment providing that railroads must have the physical valuation of their properties determined by the Interstate Commerce Commission before their bonds can be accepted as the basis for emergency currency, this is a decided victory for Senator La Follette and the group of Senators—mainly Western—who have joined with him in fighting for the "physical valuation" plan. In spite of the progress of the movement in the States—New Jersey being the latest to adopt the idea—the railroads have generally regarded the appraisal of physical values as useless where it is not positively mischievous. It would be absurd enough, no doubt, to regard the total cost of track, bridges, rolling stock, and so on, which might be higher for a lonely road in the Rockies than for one directly tributary to New York or Chicago, as representing the entire value of a line. But many men of conservative tendencies believe in determining the physical valuation of every road as one among a number of important data to be ascertained before the railroad problem can be settled intelligently.

The overwhelming vote in the House of Representatives against the proposal to compel the District of Columbia street railways to run Jim Crow cars for negroes, is refreshing proof that the spirit of 1861 is not wholly quenched in the Republican party. The vigor and spirit of the debate illustrate clearly the quickening effect of a discussion of fundamental principles and human rights. The great bulk of the colored citizens of the District are clean, inoffensive, and law-abiding. To what lengths this prejudice against color will go appears from recent events in Oklahoma. There the negroes form only 7 per cent. of the population, yet they have been "Jim-Crowed" on the railroads as if they were overwhelming in number, and were always offensive. That it is hard on the whites in certain sections of the South to travel with dirty and disorderly negroes, we have never denied, but it is just as trying for educated and refined colored people, whose number is increasing.

What part the negro vote will play in the coming election is the subject of much newspaper speculation. In 1900 there were, all told, more than two millions of colored voters in the United States. Of these, 4,576 were in Connecticut, 31,425 in New York, 29,726 in Illinois, 18,186 in Indiana, 14,965 in Kansas, 21,474 in New Jersey, 31,285 in Ohio, and 14,786 in West Virginia. The steady negro emigration from the South has, year by year, increased these figures. No doubt, the Brownsville case has stirred these negroes as has nothing else done in the name of the Republican party, and both Roosevelt and Taft, but particularly the latter, are objects of the negroes' anger. Friends of Secretary Taft, whether by authority or not, are industriously circulating among the colored people the story that privately the Secretary is deeply outraged by the President's procedure. Be this as it may, the rejoinder easily made is that, with all the new regiments and companies raised for the army in the last two years, Secretary Taft's love for the negro has not led him to organize a single new company of black men. But, bitter as is this dislike of Mr. Taft, colored voters are unlikely to abandon in a body the habits of a lifetime and go over to the Democratic party. Yet the mere fact that a number might bolt from Taft, is another reason why the Republican party should select another candidate.

It is, of course, a premise of current American politics that the Standard Oil has no friends. Those who say good words for it are its hirelings; all others are enlisted in the campaign for its extirpation. But a deeper reason why this should be safe game to hunt is found in the general assumption that it is not a tariff-created or a tariff-protected Trust. Republicans have felt particularly safe in denouncing it, because if anybody quoted against them the statement that the tariff is the mother of Trusts, they could rejoin by pointing to "petroleum, crude and refined," on the free list of the Dingley tariff law. But a Republican Congressman, Mr. Küstermann of Wisconsin, has brought together the facts regarding the relation between the most odious of monopolies and the most beneficent of tariffs. Those who have ever taken the trouble to look the subject up, know that oil is really one of the most highly protected articles of our consumption. After putting oil on the free list, Congress enacted this simple proviso:

> Provided, That if there be imported into the United States crude petroleum, or the

> products of crude petroleum, produced in any country which imposes a duty on petroleum or its products exported from the United States, there shall in such cases be levied, paid, and collected a duty upon said crude petroleum or its products so imported equal to the duty imposed by such country.

Thus from England, which has no import duties on oil, we can import as much as we like. The only difficulty is that England does not produce any petroleum. The country to which we should naturally look for petroleum is Russia, a country which produced in 1900 more crude oil than the United States, and which would, as Mr. Küstermann says, "be pleased to sell us part of their product, and sell it at a less price than it is sold for by the great monopoly in this country." But Russia, by imposing an import duty, automatically created a corresponding duty at our ports. As a matter of fact, the Russian oil which has come into this country within the last six years was taxed at the rate of 5.4 cents per gallon on the crude and 2.34 cents on the refined. With this comfortable margin of initial advantage, the price of oil to home consumers has uniformly been kept above what is paid in the other markets of the world. The tables incorporated in the speech already quoted give the average price in the United States for the years 1903-1905 as 10.3 cents per gallon, as against 9.9 cents in Hamburg, 7.7 in London, and 5.2 cents as the *New York export price.* Over the exact facts and figures there may be controversy, but we know of no reason for doubting the essential fairness of the conclusions.

The British government's present attitude towards the Congo problem is that conditions in Belgium warrant a little more patience on the part of the outside world. Nevertheless, the Under Secretary asserted in the House of Lords on Monday that the "British government would not regard as satisfactory anything short of a complete vindication of both the treaty obligations and the claims of humanity." The difficulty in Belgium is this: People and Parliament are convinced of the need of reform in the Congo. The annexation of the Free State is a thing decided upon; the general principles upon which the colony is to be governed have been embodied in a carefully worked out law. The only obstacle is the demands of the King with regard to about one-eighth of the total area of the Free State, known as the Domaine de la Couronne. At first the King insisted on retention of his existing rights. That Parliament would not consent to. Then, in the treaty of cession actually submitted to Parliament, a modification of the royal demands was presented. It consisted primarily in the exaction of large indemnities for the royal family and a pledge to maintain existing labor laws in the Domain. Before the storm of opposition this proposal aroused, the treaty was withdrawn, a few weeks ago; and among its opponents was the head of the Ministry, who had but recently accepted office. The subject is again under discussion. The British government believes that "the negotiations between the Belgian Parliament and King Leopold have now reached a crisis, and that it requires time to adjust the delicate points of difference." Englishmen and Americans may rest content with what has been accomplished; the speedy ending of Congo misrule is no longer in doubt. But it would be too much to expect the Belgian Parliament and people to be free from certain susceptibilities that do not weigh on the foreign critic. One need not hold with King Leopold's "consul-general" in this country that the Congo is a negro paradise and the Belgian King one of the world's greatest benefactors. On the other hand, we can understand how the Belgians would take pride in much of the civilizing work done in the Congo basin and credit Leopold with some of it. Another factor is the King's age. Leopold is now seventy-three. Thus in the ordinary course of events the question of the Congo should soon settle itself automatically.

Bulgaria's position in the event of a Russo-Turkish war has been little debated. That she would remain inactive is inconceivable. The Bulgarians seriously regard themselves as the scourge of Islam, destined by Divine Providence to drive the Turk out of Europe. For that work they have been steadily preparing themselves ever since their country became independent. In the past thirty years they have built up an army which has been called by European military critics the best of its size on the Continent. With a population of four million souls, Bulgaria maintains an establishment of fifty-three thousand men, and in war-time could put in the field three hundred thousand trained troops, armed with the Männlicher rifle. Bearing in mind the efficient aid received from Rumania's small army in the last war with Turkey, Russian officers would hardly despise the assistance of the most efficient military force possessed by any of the Balkan countries. If Bulgaria could put two hundred thousand men in motion at once, Russia could leave in her hands entirely the prosecution of the European campaign. The plans of the Bulgarian General Staff for a campaign against Constantinople call for the invasion of Macedonia by two armies of one hundred thousand men each. One of them would mobilize near Philippopolis, having as its objective Adrianople, which is some eight hours' march from the frontier. It is hoped that Adrianople could be carried by a sudden attack. With Adrianople taken, the only bar between the Bulgarians and Constantinople would be the strong fortress of Czertolga. The second Bulgarian army, concentrating on Kustendil, would cross the frontier near that point and march straight upon the seaport of Salonica. It is ten days' march from the frontier, and the Turks would be likely to attempt resistance at several intermediate points. They are understood to have fortified a strong position in the mountains near Seres, a pass called Bechjebel. But in no event could they concentrate a sufficient force to oppose one hundred thousand men, moving as would the Bulgarians. To withstand the Bulgarian advance, Turkey could muster the Second Army Corps, forty thousand strong, in the vilayet of Adrianople, and the First and Third Army Corps, numbering eighty thousand men, distributed throughout the other districts of Macedonia. Man for man, there is no doubt that the Bulgarian soldiers are equal to the Turks, and in discipline they must be superior. It would be strange, then, if two hundred thousand of the best of the Bulgar race could not make Turkey's position in Europe so difficult as to render an attack by Russia on her Asian back-door certain of success.

The Russian military court which condemned Gen. Stoessel to death, and then recommended commutation to ten years' imprisonment, recalls, at first sight, that other pronouncement which sentenced a man to be transported for life, and then to be fined forty pounds. But illogical as the decision of the Russian court may have been, it arose from a desire to reconcile the explicit provisions of the military regulations with extenuating circumstances. It seems to be admitted that the defence of Port Arthur, so long as it lasted, was carried on with courage and a certain amount of skill. The complaint against Gen. Stoessel is that he did not hold out longer. That he could have permanently held the fortress against Gen. Nogi is not seriously maintained anywhere; and that he avoided what, to the outsider, would appear as unnecessary slaughter, is probably true. The frequently cited accusation, however, is that the premature surrender of Port Arthur hastened the *débâcle* of Gen. Kuropatkin by releasing Gen. Nogi's army for operations before Mukden. But that is, after all, resorting to the pleasant game of might-have-been. Probably Gen. Oyama's task would have been harder without Gen. Nogi's troops. Probably Mukden would have come later. But the entire course of the war was such as to render futile any attempt to make Stoessel responsible for its outcome.

OUTLOOK FOR "THIRD PARTIES."

The leaders of minor political parties have remarkable capacity for hoping against hope. But this year there is exceptional confidence among those who think neither of the "great" parties fit to govern. A general impression prevails that the "third party" vote will prove formidable, though the question which party is destined for third place is harder than usual to solve in advance. The "third party" has always been uncertain. Back in 1872 it was the Labor Reform organization; in 1876, 1880, and 1884, the Greenback; in 1888, the Prohibition; 1892, the Populist; 1896, the Populist again, or, if that be ignored because it had only a Vice-Presidential candidate of its own, then the National Democratic; in 1900 the Prohibition once more; in 1904, the Socialist. This year three organizations are hopeful.

The Socialists point out that the whole trend of current political thought is in their direction; that the present industrial situation offers eloquent testimony to the incapacity of the parties with individualistic ideas to deal with the problems of poverty and non-employment; that the two wings of the Socialists are united for the first time in many years; that more Socialists hold office to-day in Legislatures and municipalities than ever before in this country; and that the great advance made by the party in 1904 is morally certain to be repeated several times over in 1908.

The Prohibitionists enter the campaign with the impetus of one of the most remarkable of recent political movements. In the last single year the "dry" area of this country has doubled. The progress of anti-license sentiment has been so rapid that a map of the territory gained becomes obsolete in three months. While the instruments in this steady onslaught upon the saloon have by no means always been Prohibitionists, at least the motive power was largely produced in the long years of persevering agitation by those foes of liquor who believed in maintaining an independent organization. A union of all who have voted against the saloon in the past year would undoubtedly be a tremendous force in politics. As it is, the national chairman of the Prohibitionists claims a million votes next November.

The Independence League, which met at Chicago Saturday to name its National Committee, has not appeared before as a national organization. But the testimony to its strength comes from the old parties themselves. What other body ever had its leader all but elected Mayor of the greatest American city one year, and nominated for Governor of the greatest State by the Democrats the next, while in the year after that the Republican organization of the greatest county gave it more than half the places on a Fusion ticket? In Massachusetts the Independence League asserts that it is not the third, but the second party, since its candidate last autumn polled a larger vote than the Democratic nominee under any single designation. The political unrest of the day, as many think, will help this league rather than the out-and-out Socialists. As for the Independence League's tentative platform, or rather "Address to the Public," that citizen would be an anomaly who could not find something to his taste in it. Deriving its principles from Jefferson on the one side and Lincoln on the other, the league favors in succession:

> Direct nominations, the referendum, the recall, drastic corrupt practices legislation, public ownership of the telegraph immediately, and of other public utilities "as rapidly as . . . government shall demonstrate ability to conduct public utilities for public benefit," an emergency currency issued by the government, the eight-hour day, compulsory use of safety appliances, an anti-blacklist law, good roads, the parcel post and postal savings bank, penal anti-Trust laws, ship subsidies, a big navy, irrigation, waterways improvement, an Interstate Commerce Court, and tariff reform.

It is a catalogue a trifle suggestive of the famous pledge "to give everybody everything."

Conflicting as the claims of these several parties appear, none of them can be laughed at. No one can be surprised next November at developments of voting strength outside of the Democratic and Republican lines. In the last Presidential election, the notable feature, next to the unexampled plurality of the winning candidate, was this growth of the smaller groups. Every party gained except the luckless Democrats. Roosevelt's personality was said to overshadow everything. Yet the Prohibition party added 49,000 recruits, the Populist 63,000, the Socialist 310,000, and the Socialist-Labor 300 or so—and all in a contest which brought out a smaller vote than that of 1900. This growth of minor parties accounts for a larger portion of the Democratic losses than the augmented Republican vote. The minor parties received but little over 1 per cent. of the total vote in 1900, and more than 5 per cent. in 1904. The great parties plainly have to reckon with the fact that the doubtful voter has this year more satisfactory refuges than usual. Disgruntled Republicans and Democrats have often, for purely negative reasons, voted "third tickets" to express their protest. This year, when there are so many positive reasons for following this same course, the chance of bolting is just so much greater. Politicians have long known the art of judiciously aiding the minor parties in places where they have a chance of drawing votes from the enemy. At present, such tactics will be a little like playing with fire.

LITERARY IMPERSONALITY.

George Meredith's eightieth birthday brought him many tributes and was the occasion of diverse studies. Among the latter, none can have been more singular than the article in the *Revue des Deux Mondes* by Firmin Roz. A Frenchman tackling Meredith necessarily wears something of the air of a man leading a forlorn hope. The attempt is not unlike Taine's effort to appraise Carlyle. M. Roz is fully conscious of the desperate nature of his emprise. Trained in the theory that a novel is "to be read, not to be meditated upon, commented upon, annotated," he naturally advances with fear and trembling upon the Meredithian subtlety and peculiar humor. With his results, our present concern does not lie. Whatever may be the interpretation of Meredith's works, there can be no mistake about the manner of literary life which he has led. This the French critic perceives, and has his meed of praise, in passing, for "the high probity" of a long career as a writer, "without concessions or chafferings."

This is well deserved. It would be hard to name another famous literary man of our day who has so consistently bidden the public take his books, and not his person, to pieces. Meredith has undoubtedly been, in an age when the interviewer walketh in darkness and the camera wasteth at noonday, a fine example of what has been called "the admirable impersonality of the great classic writers." They have had almost a physical shrinking from exhibiting to the public their "me," as distinct from their work. And they have wished to carry into literature the habits of gentlemen. They have not wished to disrobe themselves to gratify vulgar curiosity.

In the recently published letters of Taine, one finds proof that he upheld the doctrine of literary impersonality even more sternly than Meredith. He steadily refused to be interviewed. He declined to send his photograph to the illustrated periodicals. Even that portrait of him which Bonnat painted he would not allow to be exhibited during his lifetime. Writing once to Émile Planat, who had asked him to glance over an article about himself, he said:

> But, my dear Émile, did we not agree that this should not be done? All that you please about the writer, the abstract being made up of ideas and phrases which are public property. But nothing, nothing whatever, about the man.

In a later letter, written to Francis Charmes, Taine put the matter as follows:

> You are right in supposing that in England I was not free from emotions. But there is a large principle of Gautier and

> Stendhal, which I believe to be true; not to put on paper an exhibition of your feelings, just as a man talking in a salon or in public will repress his sobs or cries. It is indecent to make a show of your heart; it is better to be accused of having none.

Taine lived up to this to the very end. In his will, he forbade the publication of any letters of his that "touched upon the private life."

This is, we confess, a hard doctrine. It might seem impossible for any man to order his life by it, in a day when thousands are ready to break every seal and the trust betray, so that the many-headed beast may know all that it wants to. With the strongest purpose to live his private life to himself, "the world unknowing, and the world unknown," a famous man may yet find himself thwarted and defeated. Mr. Meredith has been unable to escape unscathed. In its unparalleled devotion to all that concerns the highest literature, a New York newspaper has had cabled to it the name of Meredith's dog. Love me, love my dog.

Why is it that writers like Meredith and Taine—authors who refuse to sit all day in the shop-windows, or to parade the streets as so many literary sandwich-men—seem so exceptional? Is it that good manners have declined, and that no one feels any shame nowadays in exhibiting himself, as Rousseau professed to do, *tout nu*? We do not think so badly of the mob of gentlemen and gentlewomen who write. Left to themselves they would doubtless prefer to be modest; to hide their personalities behind their books. But they are caught in the modern methods of book-publishing, and those have become noisy and personal. Notoriety means sales; and sales, notoriety. Hence the photographs showing the gifted author asleep and awake, getting into his automobile or eating his lunch; hence the literary interview and the literary paragraph and the literary rumor. All these things are thought to be a necessary part of necessary advertising. Writers would need to be more than mortal to withstand it, and would have to feel very sure of posthumous immortality to expose themselves to neglect, while alive, through unwillingness to resort to the customary means of being, for one day, our most promising novelist.

If it be said that it is all a question of personal vanity, and that a writer may be as vain in shunning public notice of his favorite underwear, as in seeking it, the reply is that the shrinking vanity is the less offensive. It is also getting to be the most self-satisfying. With the old tradition of literary impersonality abandoned, and with every schoolgirl who writes pictured and placarded, the real distinction and the true vainglory will soon consist in *not* having been photographed in your bathing suit, or interviewed in bed.

THE DECLINE OF BOOK-BUYING.

Is the good old fashion of buying books dying out? The fashion is not, perhaps, so old as some of us think; for Boswell assures us that in the age of Anne, "booksellers' shops in the provincial towns of England were very rare, so that there was not one even in Birmingham." But some publishers seem to fear that we are relapsing into the condition of the Birmingham of two centuries ago. They tell us that in this country the demand for books has by no means kept pace with the demand for other commodities, and that a generation or two since, the market for books was—considering the population and wealth of the United States—better than to-day. On this subject a sidelight has been thrown by some letters to the London *Nation*, discussing books suitable for village libraries. One of the writers, Lady Rendel, after saying that the Welsh are "more ready to read, more quick to understand," adds:

> To prove what I have said about the Welshman's greater love of books, let me mention that on two occasions, once in a shepherd's hut away in the hills, I found a shelf of books; the second time in the cottage of a woman who kept the gate of the level crossing, still more books; and when I looked through them in each case, the books were of a strongly religious turn, abstruse and theological, and in both cases I borrowed a book which interested me deeply.

These examples can, we dare say, be matched in this country, East and West. Many a farm-house in the New England hills or on the prairies contains a small but well-chosen library, books which have inspired the children with an ambition for a college education, and perhaps an intellectual life. We ourselves have seen in a little hamlet in Maine, fifteen miles from a railway, a remarkable collection of the English poets—bought by an outwardly prosaic innkeeper for the sufficient reason that he wanted to read them. This, we grant, is an exceptional case; but at the same time it is not a general rule that men who have the most money and easiest access to book-shops possess the best libraries.

An observer from Boston has noted that New York houses, even those which are large and expensive, are planned on the theory that the occupant will not want more than two or three hundred books; and that our apartments are plainly not intended to hold more than fifty or a hundred volumes. The English, if we may believe Andrew Lang, are no better off. He has described the library as a room where no one goes, and where the master of the house keeps an assortment of walking-sticks, the "Waverley Novels," "Pearson on the Creed," and Hume's "Essays." Mr. Lang continues:

> Each generation passes without adding a book, except now and then a Bradshaw or a railway novel. . . . The success, perhaps, of circulating libraries, or, it may be, the Aryan tendencies of our race, "which does not read, and lives in the open air," have made books the rarest of possessions in many houses. There are relics of the age before circulating libraries, there are fragments of the lettered store of some scholarly great-grandfather, and these, with a few odd numbers of magazines, a few primers and manuals, some sermons, and novels, make up the ordinary library of an English household.

From this, it is a far cry back to Richard de Bury, with a separate library in each of his residences, and in the house in which he was staying at the moment, so many books about his bedchamber that it was hardly possible to stand or move without treading on them.

Circulating libraries are put down by Mr. Lang as the chief of sinners; and doubtless Mr. Carnegie and his collaborators have much to answer for. But the evidence is by no means clear. If some people fall into the habit of borrowing books from public libraries, instead of buying them, other people, by seeing books at the library, may easily be fired with a desire to own them. A more potent influence, so far as our personal observation goes, is the increase in the number of magazines. The more ten-cent and other periodicals there are to read, the less likelihood that a man will turn to books, unless his taste is uncommonly well developed. Indeed, steady devotion to the cheap picture papers with which the world is flooded may effectually prevent the formation of a taste for anything so extensive and solid as even the average novel. Apparently, many persons have become so addicted to "storyettes" and three-page sketches that they cannot fix their attention on anything for more than half an hour.

But, above all, books must now compete with many other forms of recreation. The Welsh peasants whom Lady Rendel met, the Maine innkeeper of our acquaintance, turned to books partly, at least, because they had little else to do. If they were overwhelmed with invitations to dinner and luncheon, if they were members of attractive clubs, if they were offered every night the choice of a dozen theatrical or operatic performances, if their daylight hours were occupied with automobiling or other outdoor sports, the Welsh shepherd and the farmer of Massachusetts or Iowa would become just as illiterate as our fashionable folk of New York. That is a cruel thing to say of any intelligent and self-respecting man; but it is true. We cannot admit that the members of our "smart set," with all their stupidity and their passion for the inanities, are actuated by any settled principle against buying and reading books. They do, as a matter of fact, buy handsomely printed and bound "subscription" sets; buy them, we hold, with a full intention of reading some day. But so many other things must be done that the day never comes. The families who read are the fairly educated of the middle class—the families of lawyers, clergymen, teachers, doctors, and the like. They cannot afford to give many and expensive dinner parties; they cannot go to the theatre often; they actually have time to look at a book now and then. This is one reason why the rapid increase in our wealth does not mean a vastly greater demand for books. The people who get rich are by that very event swept into a circle of pleasure-seekers who have not a moment for reading. "We make debts for clothes and champagne," says Henry James's Miss Light, "but we can't spend a sou on our poor benighted minds."

OUR INFANT CRITICS.

The editor of the *Book Review*, published by the graduating classes of Public School 147, Manhattan, writes us: "Dear Friend—Your opinion of our paper will be greatly appreciated." Let us say at the outset that the paper is surprisingly good—under the circumstances. There are the usual items of school news and other odds and ends; but, as the name indicates, the literary articles are the contributions of which our young friends are proudest. We have summaries and critical estimates of Matthew Arnold's "Sohrab and Rustum," of "Oliver Twist," "Ivanhoe," "Hamlet," Hawthorne's "Great Stone Face," and Edward Brooks's "Story of the Odyssey." The children who have favored us with these book reviews are still in grammar school, that is, they are about fourteen years old. No one of them would pretend that he was impelled to write by sheer love of literature. The teacher set a subject for a "composition," and the pupil, like a little man, did his best with it. And why did the teacher choose such absurd topics? Because this is supposed to be the way to teach the art of writing English. This is an old bone of ours, but we intend to gnaw at it again.

Time was, a generation or two ago, when the subjects on which children were asked to exercise their powers were even more ridiculous: "Spring," "Winter," "Hope," "Perseverance," "Ideals," "Personal Influence," "Knowledge," "Music." With such themes as these our unhappy youth would wrestle and finally produce a string of sentences, often ungrammatical, generally vague and meaningless. The fact is that but few professional authors are capable of soaring into the realm of the abstract; and for children the attempt is simply futile. Their ideas are too hazy to be grasped and arranged in logical order—the most valuable discipline that practice in composition affords. Our infant Emersons wander hopelessly lost in a maze of twaddling generalities. Subjects drawn from books are, we grant, not quite so unhappy. The book does offer some substance into which the pupil can set his teeth. Summarizing—in limited amount—is a good exercise in composition; but from a pretty careful examination of themes written by children of all ages, we must conclude that writing literary criticism is beyond the range of most college students. For youngsters in high school, and, even more, in grammar school, it is commonly a waste of time or worse.

For one thing, literary criticism is the kind of writing which is least called for in the practical business of life. In the professions—law, medicine, theology, engineering—in all branches of commerce, men are asked to narrate events, to describe places, objects, and persons, to explain mechanical and other processes, and to present arguments dealing with brute materials; and exercise in writing along these lines is therefore extremely practical—specially important for pupils who are to enjoy no formal education beyond grammar or high school. But mere utility is not the only or perhaps the most weighty consideration. Until children have reached the age at which they can handle abstractions with reasonable firmness, they do better with concrete matters. Their literary criticism is either an echo of the teacher's words, or it is in that loose and flabby style that is the mark of slipshod thinking, and that helps to confirm the vicious habit. Of what advantage is it to set down such helter-skelter observations as these on "Sohrab and Rustum"?

> I am of a rather serious turn of mind regarding stories or poems—that is, I like a sad and sombre poem, or a wild and fearful story which holds me enthralled. Who does not appreciate the poem of Sohrab and Rustum? The cramped little student, studying away, cramming his head and filling his brain with mathematics, will, likely, not have a clear conception of Sohrab and Rustum. He—but as our teacher requires us to state a few reasonable causes for liking and disliking the poem, I will cease delivering my essay on the student and continue. I think the poem teaches us a lesson in patience and heroism. Sohrab certainly was a wonderful example of the two aforesaid qualities. I had also a more clear idea of Persia and Turkestan after I had perused and studied the work.
>
> I know but one cause for disliking the book. Although, as I said before, a sad work is my favorite, I prefer the ending to be happy. Although in a way the conclusion was a happy one, father and son being reunited, it really was too bad that Sohrab was doomed to die by the hand of Rustum.

In justice to our grammar schools and high schools, we must add that this wretched system of instruction in composition was thrust on them from above, despite the earnest protests of many of the most skilful teachers. This literary criticism is the result of the college requirement in English. The colleges insist that certain books are to be read and studied, and the entrance examination in composition—the proof that the candidate can express himself with "clearness, force, and elegance"—is based on these works. Hence, in the high school and on down to the slaughtered innocents of the grammar school the pupils are kept busy writing and writing about books. The curriculum for all students is shaped with an eye to the unpractical test for admission to college. Consider, for example, these questions from a recent entrance paper:

> What does the Spectator mean when he says that Sir Roger is "something of a humorist"? Define Sir Roger's peculiar humor, and contrast it with that of some other character in the Sir Roger de Coverley Papers.
>
> Which, in your opinion, is the superior character, Cassius or Antony? Give the reasons for your opinion.
>
> "The best-drawn character in 'Ivanhoe' is that of the Templar." Discuss this statement.

In nine cases out of ten the answers to such questions must be stilted and stupid little compositions. No one but a lunatic would think of training newspaper reporters by asking them to write about the characterization and the diction in the Sir Roger de Coverley Papers. The reporter is assigned to something definite and concrete. But your professor of literature in college is accustomed to talk to his classes about the mysteries of characterization and diction; and therefore he must send all subfreshmen to this "school of posturing and melancholy self-deception."

The Massachusetts Institute of Technology has broken the mould, and, as Prof. H. L. Seaver noted in the *Nation* of December 26, 1907, now gives at the entrance examination one "composition" question in no way connected with the required books, aimed solely to discover the candidate's capacity for written expression. It is an example which should be widely followed. But even if we retain more or less literary criticism in the secondary schools, we ought at least to banish it from the grammar grades.

CONFERENCE ON ENTRANCE REQUIREMENTS IN ENGLISH.

The Conference on Uniform Entrance Requirements in English, which met at Teachers College in this city last Friday and Saturday, made an almost insignificant change in the list of books recommended for admission to college; but nevertheless this conference is undoubtedly more significant, at least in a negative way, than any of its predecessors since the first. The conference has in the past set a sort of standard for a course in literature; and this standard has powerfully helped teachers of literature to wring support from indifferent governing boards. As a result, the claim of literature to a place as important as that of any other subject in school curricula is on the way to full establishment. The conference is satisfied that, without jeoparding what it has already gained, it may now attempt to go beyond tentative plans, such as conditions have so far required, and to discover and apply a general principle.

Although the custom of such conferences has been to provide a list of books for three years, one of the early steps of this session was to vote that the immediate recommendation, whatever it might be, should be for a single year, and that adjournment should be not *sine die*, but for one year. In other words, the conference desired a year for perfecting a comprehensive plan. The next step was to adopt for 1912 the list for 1909-1911, with only two detailed changes. A committee was then chosen to take up the whole principle underlying the choice of books and its relation to composition. The members are Prof. W. L. Cross, Yale; Prof. F. T. Baker, Teachers College, New York; Wilson Farrand, Newark Academy; Superintendent H. E. Giles, Hinsdale, Ill.; and Prof. J. B. Henneman, University of the South. This committee is to consult teachers and other persons throughout the country on many points: for example, the desirability of a defined requirement in grammar, the desirability of distinguishing in a course in literature between books "to be read" and books "to be studied," the best method of testing a student's understanding and appreciation of literature, and the comparative weight to be given to appreciation of literature and to ability to write. The conference declared in favor of greater attention to composition than most schools are now giving.

A matter of weight in the deliberations of the conference was the fact that, since the list adopted three years ago has been modified by several important colleges in the East, the entrance requirements are not actually uniform, and hence the last conference by so much failed in its avowed aim. If a student who has been carefully fitted for college changes his choice of a college late in his sub-freshman year, he may be unprepared to pass the examination. This situation led the conference to seek a change in its own standing. At present it has no permanent organization, no constitution. Though the members are all representatives of organized bodies, they are without authority to bind those organizations. These anomalous conditions led to a vote instructing the committee already chosen to submit a plan of permanent organization. Such a plan will no doubt provide something like authority for the conference, and will continue representation for various local and scholastic interests throughout the country.

NEW HITTITE RECORDS.

Prof. Hugo Winckler of the University of Berlin has published in the *Mitteilungen der Deutschen Orient Gesellschaft* further details regarding the discoveries made by him at Boghaz-Köi in the summer of 1907 (see the *Nation*, October 31, 1907), and has attempted to sketch in general outlines the historical picture which is unfolded to our view through the new documents. It appears that Professor Winckler has made considerable progress in deciphering the valuable archive that he was fortunate enough to discover in 1906, and to which additions were made last summer. Having established the fact that Boghaz-Köi marks the site of the centre of the Hittite empire as early as the fifteenth century B. C., and that the name of this centre was Khatti, he concludes that the language on such of the cuneiform tablets discovered there as are not written in Babylonian is, in all probability, none other than the Hittite translated into cuneiform characters; and numerous as the difficulties are which must still be overcome before the decipherment can be pronounced even semi-satisfactory, Professor Winckler has successfully determined the proper names and the general sense of many of the tablets—thanks in part to the ideographic system of writing titles and some of the catchwords. Professor Winckler has also settled, in a manner that will generally be regarded as convincing, that the Hittite language was an Indo-European tongue. Perhaps the greatest surprise of all revealed by the Hittite archive is the occurrence of the Hindu deities Mithras, Indra, Varuna, and the "twin" deity Nasatya. The presence of these names points to the worship of these gods in Asia Minor in the fifteenth century B. C., and definitely establishes the Aryan strain in the Hittite conglomeration of peoples. The significance of this discovery is further set forth in a paper just issued by Prof. Eduard Meyer on "The First Appearance of the Aryans in History."

In the matter of historical details, the documents, in the form chiefly of official letters, chronicles, and drafts of agreements, reveal the names of seven Hittite rulers in the fourteenth and fifteenth centuries B. C., representing five generations. Of these rulers, four were known through Egyptian records or through the cuneiform archive found at Tell-Amarna; and with the help of those contemporary documents the political situation is now placed in a clear light. The supremacy of the Hittites at this period was recognized throughout Syria and along the Phœnician coast down to southern Palestine, so that there is no longer any reason to question the correctness of Old Testament traditions which refer to an early contest between Hebrews and Hittites. The Hebrews themselves appear at this period as Khabiri (the older form of Ibri), and are regarded as synonymous with Bedouins.

Another ethnic group prominently mentioned in Old Testament records, the Horites, appear in these remarkable Hittite records as Kharri, exercising a control for a time over a district, Mitani, in northeastern Syria, and when hard pressed, entering into a compact with the Hittites. This district Mitani is, next to the Hittite region proper, the most important power of western Asia Minor (in the larger sense) during the fourteenth and fifteenth centuries. Among the documents in the Tell-Amarna archives are several letters addressed to the ruler of Egypt, Amenophis III., from Tushratta, the king of Mitani; and these are now supplemented by "Hittite" records in which the relationship of the Hittite rulers to Mitani is set forth. Supported by Egyptian favor, Tushratta had succeeded in laying siege to Nineveh, and in at least threatening also the prestige of Babylonia. After the death of Tushratta, however, a decline in the power of Mitani sets in, and the district falls under the control of the Hittites, though not without a show of energetic resistance. The same Hittite rulers who forced Mitani to subjection also interfered with the internal affairs of Babylonia. Indeed, evidence of a Hittite invasion of the Euphrates Valley as early as circa 1900 B. C., is now forthcoming, but the Hittites were driven out again by the Cassites, who, from circa 1757 B. C. until circa 1182 remained in control of Babylonia.

MORRIS JASTROW, JR.

University of Pennsylvania.

NEWS FOR BIBLIOPHILES.

An interesting book on portraits of Washington has just been printed at the Gillis Press for Charles A. Munn, who has a notable collection of engraved portraits of Washington and other famous men of the Revolution. The work, entitled "Three Types of Washington Portraits," is primarily a description of three portraits in oil which Mr. Munn has recently acquired, but it contains much interesting information about other Washington portraits. The three originals owned by Mr. Munn are: (1.) A full-length, painted in 1780 by John Trumbull, who sold it to M. de Neufville of the Amsterdam banking house. This was the original copied by Valentine Green in his mezzotint of 1781, the first authentic portrait of Washington published in Europe. For more than a hundred years the whereabouts of this painting was unknown. (2.) A full-length, painted by Charles Wilson Peale at some date between 1780 and 1783. It was purchased in 1906 by Mr. Munn in Ireland, from the great-grandson of Joseph Wilson, a Philadelphia merchant who, in 1794, was appointed by Washington to be United States consul at Dublin. (3.) Head and shoulders, face to the right, painted by Gilbert Stuart in 1795 for Mr. Scott of Lancaster, Pa. As a matter of record Mr. Munn prints in full letters and documents establishing the authenticity of his three portraits. The volume contains sixteen reproductions, including portraits of Trumbull, Peale, and Stuart, besides paintings and engravings of Washington and a curious chintz bed-curtain containing a portrait of Washington after Trumbull's painting. Two hundred and twenty-five copies have been printed.

Included in the Merwin-Clayton Sales Company's auction of March 3 are books and pamphlets on Lincoln and Washington, and Confederate imprints. On March 4 and 5 the firm sells the library of George C. Sawyer of Nashua, N. H., largely Americana, including local histories of New Hampshire, Vermont, Maine, and other States, Wheelock's tracts, relating to the Indian Charity School, and other books on the Indians, and early American trials. A rarity is a copy of Jonathan Parsons's sermon, "Good News from a Far Country," Portsmouth, N. H., 1756, the first book printed in New Hampshire. No copy seems to have been offered at public sale since 1895, when $55 was paid at C. F. Libbie's in Boston.

The Anderson Auction Company's sale of

March 2 and 3 includes some good books on the Indians, among them a copy (slightly imperfect) of Daniel Clark Sander's anonymous "History of the Indian Wars with the First Settlers of the United States, Particularly in New England," Montpelier, 1812.

The library of Brunetière, which has just been sold at auction in Paris, brought 43,531 francs. Many of the books were annotated at length by M. Brunetière.

Correspondence.

ANOTHER WORD FOR OUIDA.

TO THE EDITOR OF THE NATION:

SIR: In your issue of January 30, in noticing the death of Ouida, you say: "No one confesses to admiring her novels, and yet every one has been amused by them." May I rise to a point of order, if not to one of personal privilege, to assert that there are, undoubtedly, many who will confess to admiring her novels; and trespass upon your space to say why these people find them admirable?

Ouida's position has always been unique. She first gained the public ear near fifty years ago, and, till she recently ceased to publish, she retained her audience. Nor were her productions merely ephemeral "best sellers"; the old continued to sell after the new appeared. In the aggregate, probably a million copies of her novels have been sold; and a considerable number of them bid fair to sell for a long time to come. Such a phenomenon, it seems to me, is in no wise explained by the reasons which you assign for her popularity: viz., that she "frequently offers us what her admirers might call a rattling good yarn," compounded chiefly of "mystery, disappearance, and conspiracy," dashed with the salacious, but devoid of "eloquence, ideas, skilful delineation of human traits," etc., etc. Such an equipment, and nothing else, could not have won and kept her immense popularity. In these things alone she was equalled by a crowd of the novelists of her generation, and excelled by more than a few of them. Were this all, she would long since have disappeared with them and left nothing but a list of titles in Allibone.

Ouida's popularity I should assign to the fact that she was a woman of genius who, through her fictions, brought the world of readers into contact with an intense personality, always strikingly idiosyncratic, and possessed of a strong fascination. That she "pleased the crowd rather than the critics" (I find this phrase in a biographical notice in an eminently respectable British publication), is, of course, true. And, moreover, instead of endeavoring to please the critics, she let it be understood that to her their good opinion was immaterial. She was bound to pay the penalty. In the case of Ouida, the critic, who is not likely to be pleased with what pleases "the crowd," has done his best to disseminate the opinion the she was the purveyor of meretricious fiction, which was in no sense "literature." So far as my research has disclosed, the unsigned appreciation in the Warner Library seems the only criticism not penned in a disapproving spirit that any literary reference work has to offer.

"Meretricious"—that is the inevitable epithet; with "salacious" and "unsavory" running it hard. And that Ouida is at times meretricious is but too true. She has offered us falsities and extravagances. But, for that matter, so have most novelists; Dickens, for instance; and Balzac—and a majority of the demi-gods before whose altars the incense arises in never-ceasing clouds. If I were to relate that Ouida hangs in the salon of a mercenary courtesan "two pictures by Greuze, two by Watteau, two heads by Van Dyck, two landscapes by Ruysdael, and two by Le Guaspre, a Rembrandt, a Holbein, a Murillo, a Titian, two paintings by Teniers, a pair by Metzu, a Van Huyzum, and an Abraham Mignon," it would be hailed by the critics as the quintessence of Ouidaism. Yet she never did this. But Balzac did—and then added: "In short, 200,000 francs' worth of pictures, superbly framed. *The gilding was worth almost as much as the paintings.*" (The italics are mine.) Such a climax of barbarism and vulgarity the entire range of Ouida's exaggerations cannot match.

The legend of the "salaciousness" of Ouida's novels is an interesting souvenir of the mid-Victorian epoch. It was her misfortune to attain celebrity in an era which excelled in hypocrisy and pseudo-morality—the era which Swinburne shocked into such spasms of virtuous indignation with "Poems and Ballads"; the era in which critics exalted the fame of George Eliot, but pronounced anathema upon novels whose heroes or heroines adopted her unconventional mode of life. It was into this smug and self-righteous literary world that Ouida—I quote another eminently respectable British publication—"introduced a new and rather French note of sensual passion, previously unknown in English fiction." But the reader of to-day who pries into Ouida to feed a base appetite for this quality will be sadly disappointed: he will feel like demanding his money back at the box-office—particularly if he has lately followed through the pages of two of our chastest magazines the fictions of two ladies of the most eminent respectability.

That Ouida did introduce a new and exotic element into English fiction is true. In temperament and methods she was distinctly un-English: nor were any of her literary masters English. She herself said: "I read few English books for pleasure; I prefer the literatures of other countries." Essentially she was Continental; and a considerable part of her easily-won popularity was due to the fact that she first familiarized English readers of fiction with ideas, manners, and morals which have since become commonplaces through the opening up to them of the Continental literatures—not merely the French, but the Italian, the Spanish, the German, the Scandinavian, and the Russian. It should be remembered that when Ouida's début was made, the Continental novelists were almost wholly untranslated; while such of their works as had been Englished were chiefly of the second and third class, well Bowdlerized for the benefit of that insular hypocrisy which was passed on from London to Boston and New York.

Sexual passion plays a large part in Ouida's novels; and she has not treated it in the five-o'clock-tea manner. Her attitude toward it is almost masculine; nor does she pander to it deliberately, as is fashionable to-day with female novelists. Simply, she recognized it for what it was and is; and, if some of her immoral characters were made attractive, it was because life itself presents many such to view. Moreover, she never indulged in those excursions into the pathology of the erotic now so much in vogue; whose authors—principally women—spare us nothing, and for their "bravery" and "artistic rectitude" are critically applauded. Such passion as she depicts has at least the extenuation of warm-bloodedness, if no other. There are no swathings of subliminal neurosis in undulations of anæmic subtlety.

"Mystery, disappearance, conspiracy," were instruments that Ouida did not use in some of her most successful efforts. If we except "Under Two Flags," her most popular book is probably "Wanda"; yet it is almost destitute of those elements. Such mystery as it contains is conventional, and disclosed to the reader at the outset of the story; and it has no disappearances, no conspiracies, worth mention. For its interest it depends almost entirely upon its character and atmospheric values, both of which are wonderfully well sustained. It is a very human book, its *dramatis personæ* become very real, and it is essentially noble; while its exaggerations are artistically defensible. "Ariadne" is another novel in which the plot is of the slightest, and is conventional. Here, again, character—or, more properly, temperament—and atmosphere, make the story. No piece of English fiction makes Rome so vivid. It is permeated and saturated with the Roman spirit, both of the Rome of its day (now greatly changed) and the antique pagan Rome, which so many British and American novelists have endeavored—with what stale and tepid, what alien and guide-bookish results—to utilize.

To accomplish what she accomplished, it was necessary that Ouida should have been a literary artist—and such, in truth, she was, though by no means a perfect one; indeed, at times almost unforgivably imperfect, for a woman of her capacities. Her imperfections arose from lack of self-restraint and self-criticism, and from overproductiveness. Neither her emotions nor her tastes were disciplined. Her style is picturesque and ornamental; and, as Lafcadio Hearn says, "An ornamental style must be perfect or full of atrocious discords and incongruities: and perfect ornamentation requires slow work." Ouida, as we know, wrote very rapidly—"Idalia," "Under Two Flags," and "Tricotrin" all appeared within two years. Hence imperfections in craftsmanship accentuated defects of taste. Nevertheless she has achieved many passages which are of exquisite beauty and without blemish, and which cannot, as examples of poetic, eloquent, impassioned prose, easily be matched in English fiction. Their quality is lyrical, and their lyric beauty, while often merely sensuous, is often of a rare delicacy of feeling and imagination. To Mrs. Oliphant, who was as incapable of similar effects as a wren is incapable of the song of a nightingale, it is not strange that they failed to appeal except as "high-flown word paintings"; but to Tennyson, who was a poet;

to Mr. Lang, who is a poet, and to poets of my own acquaintance, they do appeal, and strongly.

A final reason for Ouida's popularity with so large and varied a class of readers is set forth in her essay "Unwritten Literary Laws":

> To the writer, as to the reader of a story, it should seem absolutely true. . . . The illusion of reality is only strong in the reader according to the strength of that illusion in the writer. . . . Some such illusion must always exist whilst the reader reads fiction, or fiction would have no attraction for any one.

This illusion Ouida possessed the faculty of creating. She managed to convey the impression of her story's being true, despite the fact that it was untrue—was often impossible. The modern "detached" attitude of the novelist she did not—in all likelihood, could not—assume. But in this she was perhaps wise; for as the aloofness of the average novelist increases, so also does the remoteness of his appeal. It is our consciousness of the personal presence of Dickens and Thackeray and Reade, of Meredith and Hardy and Mr. DeMorgan, of Balzac, of Hugo, and of Daudet, that delights us in their fictions—that and the sense of their personal belief in their own creations. Turguéneff alone achieves both detachment and warmth; but his detachment is seeming rather than real. Flaubert achieved detachment to the *n*th power, but while he leaves us in paroxysms of critical admiration, he has failed altogether to touch our hearts—as every performance in which virtuosity is supreme inevitably must fail. Generations of readers have wept, and will continue to weep, over the fate of Cigarette; but can it be conceived that any one ever wept over that of Emma Bovary? JOHN L. HERVEY.

Chicago, February 13.

THE "SHALLOW WATERS OF THE SHORT STORY."

TO THE EDITOR OF THE NATION:

SIR: By way of commentary on your editorial of February 6, in which you declare that the short story is the lowest type of imaginative literature, I beg to quote the following passage from Henry James's new preface to "Roderick Hudson," in the collective New York Edition of his novels and tales:

> I recall again the quite uplifted sense with which my idea, such as it was, permitted me at last to put quite out to sea. I had but hugged the shore on sundry previous small occasions; bumping about, to acquire skill, in the shallow waters and sandy coves of the "short story," and master as yet of no vessel constructed to carry sail.

New York, February 21.

LANG VS. SCOTT IN ST. MARY'S.

TO THE EDITOR OF THE NATION:

SIR: In your issue of October 31, under Notes, you say, in regard to Mr. Andrew Lang's "Poets' Country": "He knows how to slip in little controlling facts," etc., and you quote from Mr. Lang:

> It is by a loving stretch of loving memory that Scott ventures to say:
>
> Abrupt and sheer, the mountains sink
> At once upon the level brink.
>
> There are no mountains, nothing is "abrupt," nothing is "sheer"; green, grassy slopes descend placidly to the loch on one side, the other side is a plain, to which hills fall easily. It is quite true that there are no trees. except where the "slender line" of land parts St. Mary's from the Loch of Lowes. There is even no "trace of silver sand," there is merely the white margin of dry stones, ordinary stones, whatever their formation may be. As to "a thousand rills," unless you call Meggat water a "rill" (it is a sizable burn), I do not think there is a rill about the place.

Now I know St. Mary's, I have visited it frequently, and have lived two months at a time there; and I cannot conceive what made Mr. Lang write as he did, unless, indeed, his love of contradiction got the better of him. Sir Walter's description is much nearer the literal truth than Mr. Lang's. The hills are "green and grassy," it is true, but they rise abruptly from the loch. On the southeast side Peat Law, a hill 1,737 feet high, rises so abruptly that only a narrow footpath is obtainable. About half-way, where Bourhope water runs down, from between Peat Law and Bourhope Law, into the loch, there is a little plateau on which stands Bourhope farm house, and from there to the head of the loch there is a narrow driving road. On the northwest side the driving road has been terraced on the hillside all the way, except in two places: one near the foot of the loch, where the Dryhope and Kirkstead glens meet; and the second about half-way, where the Meggat water runs into the loch. Neither of these places is half a mile in extent. I find Mr. Lang's "plain" a much greater exaggeration than Sir Walter's poetical license, "abrupt and sheer."

Mr. Lang says there are no rills about the place; in Bartholomew's reduced ordnance survey map, which I have before me as I write, ten streams, exclusive of the Meggat, are marked. Mr. Lang evidently has not seen St. Mary's after a few days' heavy rainfall, when not only these ten are visible, but so many other rills are tumbling down the hillsides as to excuse Sir Walter's "thousand rills." G. P.

Murrayfield, Midlothian, January 7.

TO THE EDITOR OF THE NATION:

SIR: I fear that I must differ from G. P.'s letter on the topography of St. Mary's Loch. I have fished it, in all weathers, since early boyhood. Scott, with his habitual generosity, speaks of the "mountains." There are no mountains on the Border; there are "considerable protuberances," big round-shouldered green hills. Their sides are not, at St. Mary's, "sheer" (as the poet too kindly sings); at most the slopes are steepish. As to "rills," Scott's statistics assure us that there are "a thousand"; G. P. finds ten "colored on the card." In fine weather, such as Scott describes, the ten, like the Styx, contain "just enough water to swear by," but evade the non-scientific observer. Scott is not speaking of the loch after heavy rain lasting for a week. As to Scott's "silver sand," G. P. attempts no defence of a statement which merely proves that Scott never fished the loch from the shore. In short, Sir Walter wrote about the loch as he did about the dramas of Miss Joanna Baillie. In his own words, he added "a cocked hat and a sword." A. LANG.

St. Andrews, Fife, February 8.

QUALIFICATIONS OF SCHOOL TRUSTEES.

TO THE EDITOR OF THE NATION:

SIR: The difficulties in the way of securing suitable persons to act as trustees of the public schools—a subject recently discussed in your columns—have been in the past almost insurmountable and probably will continue so for years to come. School trustees should be one of two things: either experts in the line of business that they undertake to supervise, or simply persons of sound common sense and becoming modesty. As a rule they are neither. Experts in practical psychology, pedagogy, and school administration are exceedingly rare. School trustees who frankly acknowledge their limitations in such matters are still rarer. In ordinary circumstances about all that a school board ought to undertake to do is to select a capable superintendent—one who is neither a fanatic nor a fossil—and, after that, follow his advice. This the average school trustee is unwilling to do. He is likely to take himself seriously and to assume that appointment or election to office endows him with the necessary qualifications—instantly, *ipso facto*, miraculously.

This readiness to undertake the function of any and every public office, regardless of equipment, is an extraordinary feature of American public life. Nor is the willingness of the public to accept candidates of manifest incompetence easily explained. The successful butcher, baker, and even man-milliner, haven't the slightest hesitation in becoming guardians of public education—a place for which they are palpably unfitted—and without a qualm of conscience they legislate on matters which they cannot possibly understand. If the same butcher, baker, or man-milliner were put in command of a hospital or a street railway or a saw-mill, or of any commercial, industrial, or mercantile enterprise, the public would instantly enter vigorous protest. What does the expert in sausages and hams know about psychology? What have fried cakes and mince pie to do with pedagogy? How much are the opinions of the man whose thoughts revolve on women's hats and ribbons worth in school administration? When the successful boiler-maker, chair-manufacturer, or sewer-builder talks about art or finance or international policy, the public laughs. But the doctrine of *ne sutor* does not apply to public affairs.

Whatever the genesis of this popular hallucination, the practical outcome is a belief that it is wise to pick up any respectable citizen, of fair average intelligence, and to set him over a vast and complicated organization dealing with deep and intricate questions of public policy, with right to dictate to and overrule experts who have devoted their lives to the subject. The sane American who admits that a private enterprise conducted on these principles would go into bankruptcy within six months seems unable to apply the same process of reasoning to public affairs. M.

Notes.

The "Life of Alice Freeman Palmer," by her husband, Prof. George Herbert Palmer of Harvard, will be published in April by Houghton, Mifflin & Co. It may be looked forward to as a book of great interest.

Gaillard Hunt has edited Madison's "Journal of the Constitutional Convention," and added notes with comparisons made from the less complete chronicles of the convention kept by Yates, King, and Pierce. The book, in two volumes, will be published by Putnams next month.

Paul Elder & Co. announce as forthcoming, "The Mother of California," by A. W. North; "The Secrets of Beauty and the Mysteries of Health," by Mrs. J. B. Potter, and "Love Sonnets of a Car Conductor," by Wallace Irwin.

A second edition of Irving B. Richman's "Rhode Island: Its Making and Its Meaning (1636-83)" has been issued, unabridged in a single volume, by G. P. Putnam's Sons. In the *Nation* of January 1, 1903, our reviewer said that the work was "an unusually careful and impartial piece of investigation," and must be considered "a valuable contribution to American colonial history."

The country has been somewhat slow in taking in the fact that in the maintenance of the cause of the Union the navy performed work to the full as important as the army. Even so distinguished an historian as Rhodes has been sharply taken to task by no less a critic than C. F. Adams for a quite inadequate presentation of what was done upon the waters. Intelligent Confederate writers indeed ascribe their defeat more to the navy than to the army, and perhaps posterity will think this correct. The publication of the Official Naval Records, delayed until these later years, makes it now possible to know exactly what the navy did. "The Cruise and Captures of the Alabama," by Albert M. Goodrich (Minneapolis: H. W. Wilson & Co.), is a graphic, impartial, and trustworthy résumé, based upon the documents of what was perhaps the most picturesque and important episode of the ocean warfare.

Men still in active life recall that in the map of North America of their school days, a vast area of the West, the profuse dotting suggesting illimitable land, was labelled the "Great American Desert." This region stood in boyish imagination as a true counterpart of Sahara. An intelligent writer in a book published as late as 1858 expresses the idea that the exploration of Lewis and Clark, though picturesque and heroic, had little practical value, the country laid open being quite too barren and lying too far north for human habitation. To those desiring to know how this great Western area, wholesome in climate, abounding in resources, agricultural and mineral, swarming with a population of millions, has come to be regarded as a choice part of the United States, "The Great Plains," by Randall Parrish (Chicago: A. C. McClurg & Co.), affords excellent information. We have here an interesting story of the transformation of a wilderness into commonwealths on the whole well-administered, societies of flourishing, highly civilized men, who believe their land to be the best on which the sun shines.

Life in Cincinnati seventy years ago is charmingly pictured in the privately printed "Tribute to Sarah Elliott Perkins by her granddaughter, Edith Perkins Cunningham." The author calls the book "Owls Nest," after the old family homestead, given recently to the city park by her father, the late president of the Cincinnati, Burlington and Quincy Railroad, and his brother. The grandfather, James Handasyd Perkins, who was of a well-known Boston family, came to the West in 1832, and during the closing years of his life was pastor of the Unitarian Church at Cincinnati, in succession to his biographer, the Rev. William H. Channing. Both he and his wife, who came from Guilford, Conn., were active in literary, educational, and philanthropic work, and their house was a centre of generous hospitality. Among their friends were Salmon P. Chase and Dr. Lyman Beecher and his daughters, Harriet and Catherine. The latter is characterized as "one of the best, most sensible, witty, entertaining personages whom fate ever kept single." Among the figures which flit across the pages are Harriet Martineau, Fredrika Bremer, Fanny Kemble, Charlotte Cushman, Dorothea Dix, Daniel Webster, and Ralph Waldo Emerson. As one catches glimpses of them in the gatherings of the Semi-Colon Club and other recreative entertainments, it is difficult to realize that Mrs. Trollope has described Cincinnati at that time, in her "Domestic Manners of the Americans," as "the *triste* little town" where billiards and cards were forbidden by law, and theatre-going was regarded as "an offence against religion." The narrative, however, is not confined to this place, but has much of interest to Bostonians, and ranges from London to San Domingo.

"The Home Life of Poe," by Susan Archer Weiss, is not, and does not claim to be, a full biography of the poet, nor is it written with any literary grace. Within its own field, however, as an intimate portrait of Poe and of those with whom he lived from childhood to death, we regard it as the sanest and truest book yet published. The failings of the man are not concealed, but they are treated humanly, with neither the attempt to throw the blame for them on others, as certain advocates have tried to do, nor the more common gloating over his weaknesses which has been carried on by most biographers from the jealousies aroused by Poe among his contemporaries. Possibly there is a touch of undue animosity shown against Mrs. Clemm and her daughter, but on the whole the story of that strange triangular family as here given seems to us more authentic and natural than as it comes to us through Professor Woodberry (whom Mrs. Weiss persistently calls Woodbury). And so also in regard to Poe's relations with women during his latter years. To see the writer of the exquisite poems to "Helen" and "Annie" fluttering between a morbid susceptibility to feminine charms and a desire to find a wife who would supply him with money, to see him rushing from one eligible party to another, is not a spectacle flattering to our human nature. These sordid, vulgar episodes should never have been made public at all; yet, as it is too late to recall them, the next best thing is to have them in their true light, as they are here presented. Mrs. Weiss is right in laying Poe's errors to weakness of will and not to viciousness; she leaves us with more of pity for the man than of indignation against him. And withal, though the responsibility for his errors cannot be shifted upon any other shoulders than his own, yet, in his larger relation to the public, in his terrible struggle with poverty, he was as much sinned against as sinning. Mrs. Weiss corrects some minor details of fact in regard to Poe's marriage, his quarrel with Mrs. Allan, and other matters; she gives also a curious bit of conversation between the poet and herself over "The Raven"; but her chief service is in presenting a thoroughly human likeness of one about whom legends were not slow to flourish, and, indeed, still flourish. (Broadway Publishing Company.)

One volume of Horace Traubel's shirt-sleeve Boswellianism was tolerable, even valuable, a second volume of 563 closely printed pages is too much for patience. ("With Walt Whitman in Camden," D. Appleton & Co.). What profit there can be in following the record of Whitman's health day by weary day, in reading the diary of his trivial talk night by weary night, we do not see. The fact is, that Whitman comes out of this terrible ordeal a lessened man. Of intellectual life he had small measure, and it becomes monotonous to have two or three ideas drummed into one's ears over and over a thousand times. Curiously enough, though he never misses a fling at the "literary fellers" and cannot think of a literary class in America without being struck "with a laugh or with nausea," almost all his conversation that has much point or interest is about books and writers. Occasionally, as in his criticism of Heine, he exhibits rather startling powers of discrimination. Oftener his insatiable egotism is the arbiter, and he divides authors, as he divides all other men, into two classes, Whitmanites and non-Whitmanites. Such absorption as he betrays in his own work is extraordinary, even among the vanities of authors. This is the one theme about which conversation forever revolves: the authentic revelation of the "Leaves of Grass" and their power as a touchstone to classify all men and books and events. Thus Emerson comes in for a good deal of discussion; there is something comical in the unconscious ignoring of the fact, by both Whitman and his satellite, that Emerson may have any value or meaning to the world apart from his relation to Whitman's message. As this pitiless exposure of the old man's fading days sets his intellectual poverty in a glaring light, so it changes the inspired utterances of his egotism to a senile self-importance. Even his experience of life becomes deceptively contracted in these memoirs. With all his garrulity, Whitman seems to have retained always a curious reticence about sundry events of his life. Some, but not many, of the letters copied are interesting. Perhaps the most significant is the really beautiful letter from Lionel Johnson, written when that ill-fated poet was only eighteen, and giving further evidence that the chief following of Whitman in Great Britain was among the over-ripe and over-educated, who were drawn by the roughness and coarse virility of the man. Yet, withal, though we must account these records as misjudged as they are extraordinary, and though we feel that Mr. Traubel is unqualified to distinguish between the real greatness and the fustian of Whitman's poems—yet withal there does rise at times through this deluge of trivialities and self-asserting vulgarities a word from the depths, revealing dimly the inspiration that saves the "Leaves of Grass." Mr. Traubel, we think, belittles his hero; it is even possible, if not probable, that Whitman himself never saw with the eye of the analyzing intellect the deep-seated sources of emotion and awe which feed his poetry at its best.

"A book of suggestion" is an excellent description of Annie Winsor Allen's "Home, School, and Vacation" (Houghton, Mifflin & Co.)—a volume of detailed rules for bringing up children. The opening chapters are devoted to generalities and "what to avoid"; and the rest is constructive, with appended tables telling what should be accomplished at the various ages, both physically and mentally. The underlying principle in Mrs. Allen's scheme of education is well expressed by her phrases: "Not a month must be unheeded—the child will never come to that age again." This seems rather a dreadful thought in connection with babies, but possibly learning useful things may be made as easy and amusing as new games. One is tempted to think that more bodily and less mental exercise would be better; but Mrs. Allen makes allowance for that also, and constantly warns against over-stimulation. Her chapter on discipline is suggestive. The rules and remarks about older children to the age of twenty-one are of equal value and interest. Having taught successfully for a number of years, she is well qualified to speak of schools and schooling.

"Greece and the Ægean Islands," by Philip S. Marden. (Houghton, Mifflin & Co.), is written in the spirit of the amateur who loves Greece, and who desires to allure others to visit her. To accomplish this object the author, describes his own experiences in Crete, Athens, Delphi, the Argolid, Olympia, Delos, Samos, Rhodes, Thera, Corfu, and other places; but since he frankly disclaims a scientific acquaintance with Greece, he undertakes the difficult task of poaching on the preserves of the archæologists. His best chapters, accordingly, are those in which, as in his excellent accounts of modern Athens, Arcadia, Andhritsaena, and Thera, he treats of present conditions, delightful scenery, or incidents of the way; for here his unfamiliarity with the literature, history, and art of Greece is less of a handicap. For example, the chapters on Crete and Delphi might have been made more interesting, without being cumbered with technicalities, if they had recounted the romantic history of the remarkable excavations there. The few errors in statement may, perhaps, be denominated unfortunate inaccuracies rather than heinous offences. It is surprising to find that the lions of Mycenæ, after standing patiently on their hind legs for centuries, had sat down when Mr. Marden saw them (p. 178); and it would have been better to imply that Mr. Penrose and not Mr. Gardner, is really the exponent of the curvature of the Parthenon (p. 84); better not to accept the discarded view of the "treasuries" at Mycenæ (p. 184), and to hint that a controversy exists in regard to the Lysippus statue at Delphi (p. 166). The style, too, is not impeccable. To balance these blemishes there is a pleasing self-restraint in the avoidance of exuberant epithet, and a comparative absence of paragraphs that recall the manner of the incomparable Baedeker. The illustrations are admirable, and would make a book of much value and interest worth possessing.

A new version of Dante's much-translated "Inferno," has been made by the chief justice of the Australian Commonwealth, the Rt. Hon. Sir S. W. Griffith (Sydney. Angus & Robertson). There have been English renderings of Dante in many measures and in plain prose; this is one of the few attempts in English in the metre of the original. Has the author realized his ambition? Whatever else it may be, a translation must, first of all be faithful, and so ripe an Italian scholar as Principal Harper of Sydney pronounces the new translation a marvel of accuracy. The measure is at once more and less debatable. If it would be too much to say that the lines never halt, in general they run smoothly. The fault of his versification is, not that it is unrhythmical, but that it is wooden. Often the language is not poetical at all; sometimes it is "pure pr—— no, 'tis not even prose," as Lowell said of Emerson's verses. The "ethereal lift" is wanting. The inner vision, painted as in flames on a background of darkness, is not there, or at least the translator fails to use such words as render it.

A book of verse, composed, set up, printed off (with its eleven large pictures from photographic blocks and its thirty-six cuts of Australian wild-flowers), bound and published by the author, is a curiosity even in these days of curiosities. Walt Whitman in both senses of the word composed the "Leaves of Grass," but he was a professional compositor. A. W. Brazier, author of "Music and Light and Other Verse," is a Melbourne librarian. Though obviously inspired by the great paintings that are used to illustrate them, his poems have a stamp of individuality and independence.

Books on philosophy have not yet been produced in any number in Australia. Indeed, till Professor Mitchell of Adelaide some months ago published a treatise on metaphysics, it may be doubted if there had been any at all; and as Mr. Mitchell's volume was issued in England and inspired by the author's Scottish training, it belongs rather to English than to Australian literature. A more popular work, addressed to the general reader, is "Kosmos; or, Philosophic Studies on Order and Correlations in Nature, Mind, Art, and Theism," by George Woolnough (Melbourne: George Robertson & Co.). He is a working journalist, who has been struck with the story of Laura Bridgman and has concluded that the order of her acquisitions was the natural order, which ought to be a model at once for the educator and the philosopher.

With Dr. Karl Schüddekopf as chief editor, a complete edition of the works of Clemens Brentano, including correspondence, will be published by Georg Müller, Munich. All those who have in their possession letters or manuscripts of Brentano are asked to turn them over for the time being to the editor in Weimar.

Prof. A. Bertholet of the University of Basel has issued (Tübingen: J. C. B. Mohr) a collection of data for the study of the origin and development of the leading religions of the Orient, called "Religionsgeschichtliches Lesebuch." His four coadjutors are Prof. William Grube of Berlin, religion of the ancient Chinese; Prof. Karl F. Geldner of Marburg, religion of the Vedas, Brahmanism, and the Zoroastrian religion of the Avesta; Prof. M. Winternitz of Prague, Buddhism; and Prof. A. Mez of Basel, the religion of Islam, as based on the Koran.

As Volume XXI. in the series known as Land und Leute, Monographien zur Erdkunde (Leipzig: Velhagen & Klasing), Prof. Hermann Guthe of the University of Leipzig, has just issued his "Palästina," with 142 illustrations and one chart (4 marks). The author was for many years the editor of the *Zeitschrift* of the German Palestine Society. The book deals with the soil and climate, fauna and flora, and the inhabitants, and brings from the Old Testament an abundance of illustrative matter. Toward the close of the book the author discusses the archæology of the Holy Land, both of the Biblical and the pre-Biblical periods.

Prof. Heinrich Weinel has written for the series known as Lebensfragen, of which he is general editor, a volume entitled "Ibsen, Björnson, Nietzsche" (Tübingen: J. C. B. Mohr). The aim of the book is sufficiently indicated by the sub-title, "Individualismus und Christentum."

The lectures on ethics delivered in Tübingen by the late Prof. Johannes Gottschick have just been issued under the title "Ethik" (Tübingen: J. C. B. Mohr).

The report of the Public Library of the District of Columbia for the year 1907 shows a stock of 92,937 volumes, a registry of 45,231 borrowers, a reading-room attendance of 133,059 persons, and a circulation of 481,463 volumes. Since the occupation of the new building in 1903 the growth in annual circulation has been from 214,261 to 481,463 volumes, or more than 125 per cent. More significant than this increase in volume has been the change in the character of the circulation: the percentage of fiction issued has decreased from 83.7 to 69, with a corresponding increase in the use of non-fiction. The methods that have brought about this change have been to bring before the readers, in as persuasive a way as possible, the better and more invitng kinds of non-fiction, thus to a degree counteracting in the public mind the impression produced by the advertisements of current fiction. Particularly effective in influencing the choice of readers has been the display in rotation of the various classes of books in the open-shelf room, or lobby. The percentage of loans in each class has been immediately affected by this display.

A Social Education Conference, in continuation of the work of the Social Education Congress of 1906, will be held in Boston on the evenings of March 6, 7, and 8. The subject will be "The Social Education of Girls and Women." The speakers will be Prof. Julius Sachs, Columbia University; Miss Julia Richman, district superintendent of schools, New York; the Rev. Samuel McChord Crothers, Cambridge, Mass.; Miss Katherine E. Conway, editor of *The Pilot*; Mrs. Florence Kelley, secretary of the National Consumers' League; Mrs. Charlotte Perkins Gilman; Prof. Thomas N. Carver, Harvard; Mrs. Mary K. O'Sullivan, vice-president of the Women's Trade Union League; Mrs. Julia Ward Howe; President Mary E. Woolley, Mount Holyoke College; Prof. E. Charlton Black, Boston University; and Mrs. May Alden Ward, president of the State Federation of Women's Clubs.

The present state of the educational awakening in China is the subject of an informing letter in the London *Times*, February 6, from its Shanghai correspondent. Some interesting facts are given in relation to the new educational and general literature which is flooding the country. A large proportion of the educational works come from a native Commercial Press, a company with agencies all over the empire. Its text-books vary in price from five cents for "Elementary Ethics," to ten cents for "First Readers" and thirty-nine cents and upwards for handbooks on scientific subjects. Of one of the text-books 355,000 copies had been printed in 1906. Moreover, there is a growing demand for translations of novels and light literature, of which at present there are 220. The most popular of all European works of fiction now on the market is "La Dame aux Camélias." Others that sell freely are "Treasure Island," "Robinson Crusoe," Irving's "Sketch Book," "Uncle Tom's Cabin," "Ivanhoe," Haggard's "Dawn," "The Talisman," "Les Misérables," "Manon Lescaut," "Arabian Nights," and "Sherlock Holmes." In reference to these novels the correspondent says that it "must be borne in mind that our romantic and sentimental treatment of the relations of the sexes is a thing so foreign to Oriental ethics that the hero of the ordinary European novel appears to the Chinese mind as a person of perverted moral sense and doubtful sanity. . . . A Chinese novelist would have solved the difficulties of David Copperfield, and avoided much unnecessary pathos, by making him woo and marry Dora and Agnes simultaneously." His concluding suggestion is:

> The provision of one hundred good books suitable for Chinese readers would be of the greatest help to the cause of civilization; the list should commence with translations of the best Greek and Roman classics and end with standard English tales of travel and exploration.

Edward Gaylord Bourne, professor of history in Yale University since 1895, died last Monday. He was born at Strykersville, N. Y., in 1860, and was graduated from Yale in 1883. From 1888 to 1895 he was a member of the faculty of Adelbert College; and he had served as chairman of the Historical Manuscripts Commission. He was the author of several books: "The History of the Surplus Revenue of 1837" (1885), "Essays in Historical Criticism" (1901), "Historical Introduction to the Philippine Islands" (1903), "Spain in America" (1904), and "Life of J. L. Motley" (1905). Besides this original work, he was a busy editor, his name standing on Wolley's "A Two Years' Journal in New York" (1902), Fournier's "Napoleon I." (1903), Rocher's "Spanish Colonial System" (1904), "The Chase Papers" (1903), "The Narrative of De Soto" (1904), and "The Voyages of Champlain" (1905). He was one of the editors of the *Yale Review* and a valued contributor to the *Nation*.

The Right Rev. Henry Yates Satterlee, for the last twelve years Protestant Episcopal bishop of Washington, died at Washington February 22. He was born in New York in 1843 and educated at Columbia and the General Theological Seminary. He was author of "Christ and His Church," "Life Lessons from the Prayer Book," "A Creedless Gospel and the Gospel Creed," "New Testament Churchmanship," "The Building of a Cathedral," and "The Calling of a Christian."

George Helm Yeaman, a lawyer of this city, died November 23. He had been a member of Congress, minister to Denmark, and lecturer on constitutional law at the Columbia Law School. He was author of "The Study of Government," of pamphlets on political and financial questions, and of the article "Legal Aspects of Insanity" in the American supplement to the "Encyclopædia Britannica."

Dr. Adolf Hansen, lecturer in English at Copenhagen University, has died in his fifty-eighth year. He was known for his history of English literature and for his translations of "Childe Harold" and Shakespeare's Sonnets.

STUDIES IN AMERICAN HISTORY.

The American Revolution. Part III. Saratoga and Brandywine. Valley Forge. England and France at War. By Sir George Otto Trevelyan. New York: Longmans, Green & Co. $2.50 net.

The period covered by this volume gives the author every opportunity to display his best qualities as an historian. A careful investigator, he has a keen eye for the picturesque, even resorting to legends of doubtful origin where they may serve his purpose. After stating his facts, he has no hesitation in expressing a definite opinion, which carries conviction to the reader more by reason of its obvious honesty than because it is the final word to be said. His point of view is so catholic, his reading so wide, and his likes and dislikes so positive that he confers upon the story a semblance of novelty, due to his own personal qualities as a writer. Moreover, it is a pleasure to observe his sympathy for the best in the American cause; for he is a democrat in spirit, and feels the popular movement, of which the Revolution was but one symptom. Yet he is strongly British when discussing European affairs, looking upon the declaration of war by France against England as an instance of bad faith; involving an unnecessary and objectless struggle, and driving France to ruinous measures. Peace would have made France the great Power on the Continent; war hastened the destruction of what was regarded as a cause of her greatness. And, finally, he shows clearly in these pages the depth to which England sank in political morality through her contest with America—an eloquent arraignment of a spoils system.

The narrative of military events is skilfully told, and it would be difficult to point out any omission of essential fact. The invasion from Canada under Burgoyne and the taking of Philadelphia by Howe are the two leading events, but a number of connected manœuvres and engagements occurred which lend themselves to the graphic methods of the author. His criticisms of the British generals are severe, but are tempered by praise for military qualities which could not be advantageously used in existing circumstances. Unsupported by Howe, Burgoyne's expedition was doomed to fail, but the real fault lay with Germaine, whose incompetency was not in need of such advertisement. Howe's course was quite as extraordinary as Germaine's; for his futile march into New Jersey was followed by a long journey by sea to take Philadelphia, a journey as wasteful of valuable time as of money and lives. Without orders from London to aid Burgoyne, he was free to pursue his own policy; but the occupation of Philadelphia was unnecessary, costly, and in the end did much to increase, even among loyalists, the bitter feeling against the English and their hired auxiliaries. The Peace Commission came at an unpropitious time and in an unfortunate manner. During six months the "question whether Great Britain could conciliate, pacify, and permanently and smoothly govern America, was tried out in a limited and securely protected locality, under every condition which could be expected to ensure success." It failed completely. The absence of either civil or military success, and the certainty of war with France, seemed to bring the fortunes of Great Britain to their lowest point. The energies of her rulers were devoted to unworthy and unprofitable objects, and the personal government of the King excluded from office the men best fitted to maintain the better qualities of British policy. A civil war had degenerated into a war of conquest, and the national reputation for prudence and shrewdness was grievously impaired in the eyes of Europe.

The American generals receive praise fairly given. Washington was a king by nature, always a fighting general, and the man who was the very centre of the Revolution. Yet his master strokes of victory were few, and his strategy was imperfect:

> Any painstaking military student, without being a Clausewitz or a Jomini, can see that Washington made mistakes and missed chances; but the final result of his exertions was the total discomfiture of his adversary.

Ultimate success came from his skill and foresight, and still more from his elevation of character. Gates receives no mercy. He is a "lobbyist," a miserable self-seeker, a sorry tactician, whose one victory is due, not to himself, but to Arnold. He had no public spirit and no personal gratitude, being hopelessly incapable as a leader in battle, and even a coward. Greene and Wayne are ranked high, but a protest is made against calling the affair at Paoli a "massacre," which it was not. To Schuyler is given unstinted praise, and nothing could be more skilful than the comparisons made betwen Schuyler and Gates, Conway and Lafayette, Wilkinson and Hamilton.

As to the course of Congress on the convention of Saratoga, it placed the young republic "below the moral level of civilized and self-respecting nations," and remains a blot on the lustre of the American Revolution. To arrive at an entirely just opinion on that subject is difficult, for the original convention was a blunder perpetrated by Gates, and much confused by subsequent disputes, grievances, and charges of bad faith on both sides, which induced Congress practically to set it aside.

Of Congress in those years the author says little good. The industry and devotedness of some of the members could not compensate for serious errors committed in internal and foreign policy. The commissariat system broke down at a critical time, the finances were mismanaged, offensive operations were demanded when the army was a mere shadow, and a cabal against Washington was fostered when his services were all essential. The question might be raised whether the author is not too severe on that body, made up of men whom he calls politicians and pettifoggers. All executive functions were nominally concentrated in Congress, which at the same time had no adequate machinery for carrying its resolutions into effect. It was certainly never a "handful of untrained and for the most part insignificant personages," for some of the best constructive measures were framed at a time when the representation appeared weakest. The resolves on accounts of April, 1777, which are condemned as destructive of efficiency and discipline, were called for by the prevalence of practices which made honesty out of the question. The criticisms passed upon Washington were in part grounded on a fear that the continent would be left without a leader should he be removed by one of the many chances of war. For the bad use made of this feeling by some self-seekers Congress was not responsible, and the general support given to Washington was proof of loyalty to his policies. The many unfortunate errors committed in appointing unfit diplomatic agents were largely compensated for by the recognition of Franklin. In this formative period, when there was no true confederation, and consequently no real power in Congress, many of its acts are open to criticism; but the progress towards better conditions was steady and fruitful. Better the honest errors of Adams, the Lees, and even Rush, than the acts of a Weymouth, a Sandwich, or a Germaine.

The Campaign of Santiago de Cuba. By Herbert H. Sargent. Chicago: A. C. McClurg & Co. $5 net.

The announcement that Capt. Herbert H. Sargent of the Second Cavalry had undertaken a history of the Spanish-American war inspired hopes that the result would be an authoritative work; for his excellent studies, "Napoleon Bonaparte's First Campaign" and "The Campaign of Marengo," now in their fourth and third editions respectively, gave great promise. These hopes, however, are not realized by the three volumes before us. Painstaking they are, and full of valuable citations from Spanish, German, and American sources; yet the judicial spirit of the historian is lacking. Thus, in his survey of the causes leading up to the struggle, he boldly assumes not only that the blowing up of the Maine necessitated the war, but that "the American people and their representatives in Congress believed that Spanish officials were responsible for the destruction of the Maine, and they were determined that Spain should atone for the act and that her rule in Cuba should end." Even those who think our war in Cuba a holy crusade should protest against this attributing to the bulk of the people of that moblike thirst for blood, that low spirit of revenge, which was actually confined to a few yellow journals and hysterical persons. In this connection also Capt. Sargent fails to relate the efforts made for peace or to record the shameful suppression by President McKinley of that dispatch from the Spanish government, received on the eve of war, which granted every demand made upon Spain up to that time.

In treating the details of the battle before Santiago, Capt. Sargent holds that the raising of the American balloon and moving it along the road which the American troops were following to San Juan was a costly blunder. In support of this view, he cites the opinion of that eminent military critic, Richard Harding Davis, and of the chief of the Signal Corps, Gen. A. W. Greely. To be just to Lieut.-Col. Derby, the able engineer and officer responsible for the raising of the balloon, a really scientific historian would at least have presented his side. About Gen. Shafter, Capt. Sargent writes rather enthusiastically. He admits, however, that Shafter violated a fundamental principle of strategy in detaching Lawton's division to take El Caney, because Lawton and Chaffee assured him it would need only a couple of hours to reduce that place; whereas every consideration dictated the keeping intact of Shafter's main force, and the leaving of only a regiment and a battery or two to contain El Caney. Capt. Sargent grants, also, that several tactical blunders were made in the face of the enemy. None the less, he describes Gen. Shafter (about whom he writes in the present tense, although the general died in November, 1906), as having "indomitable, rugged energy," being a "blunt, brave soldier," a "fighter," "firm, untiring, decided," and "successful because he had a clear comprehension of the principles of war." But even this—enough to make one sit up and rub one's eyes—is as nothing to the characterization of Secretary Alger as "efficient," and of Gen. Henry C. Corbin as the "greatest executive staff officer this country has ever known."

These individual judgments are enough to discredit the book as that of a judicial military student; and the deeper one goes into the work, the more evident it is that the volume is more than anything else a tract for a large and costly standing army and a navy second only to that of Great Britain. Nevertheless, many of Capt. Sargent's professional comments, which follow each chapter, are admirable, as, for instance, his pointing out the mistakes of the Spanish commanders in their efforts to end the Cuban revolution from 1896 on. But when we find no comment whatever on Gen. Shafter's famous and inexcusable dispatch of July 3: "I am seriously considering withdrawing about five miles," our faith in Capt. Sargent's desire to write in a really non-partisan spirit is much shaken. Again, his "General Comments" in volume three, range far afield, including a discussion of the Boer war and of Great Britain's imperial destiny. In conclusion, while the book must long remain a handy volume for reference, because of the many facts and figures it gives, it leaves the field still open to the historian who wishes to tell without fear or favor the true story of our ever-regrettable West Indian war.

CURRENT FICTION.

Dr. Ellen. By Juliet Wilbor Tompkins. New York: The Baker & Taylor Co.

Dr. Ellen was blonde, and yet looked well in khaki; her "nose and chin were roughly modelled, but the mouth had been exquisitely and delicately finished." In action she suggested the figurehead of a Viking ship, and when we read that Amsden "never saw this woman without an overwhelming desire to match his strength against hers," we settle back comfortably to unwind the tangled skein of their romance at leisure, secure in the confidence that the romance is indeed to be theirs. To be sure, the fatal charm of Amsden's cameo profile is too strong for the susceptible heart of Ruth, Dr. Ellen's sister, who proves the truth of her claim to possession of all the "comfortable little feminine vices" by making herself intensely disagreeable to her high-minded relative; but Amsden, though tempted for a moment by her beauty and simplicity, gently informs her—through an intermediary—that he will be a brother to her, if he can compass it, and all ends as it should.

Dr. Ellen's struggle against an unscrupulous quack for the confidence of her mountain patients, and her ultimate triumph, furnish the bulk of the incident—a sombre groundwork, which Willie Wallace enlivens with beams of such amiable inanity that we rather resent his final casting into the arms of the objectionable Christine, to furnish a jingling obligato for the solemn wedding bells of the hero and heroine.

Deborah of Tod's. By Mrs. Henry de la Pasture. New York: E. P. Dutton & Co.

This is an earlier story by the now popular author of "Peter's Mother" and "The Lonely Lady of Grosvenor Square." It is much the same sort of wholesome and good-tempered romance, just the thing for the large class of readers always on the lookout for fiction that is neither dull nor distressing. Mrs. de la Pasture's stories move along the pleasant lines of the fiction of Miss Braddon and William Black. Her heroines are nice English girls in reduced social or pecuniary circumstance destined in the fulness of time to marry the amiable lord or baronet who may early be descried cruising matrimonially in the offing.

Deborah of Tod's is to our mind a more interesting figure than her successors. Tod's is a thrifty farm in Devon which has belonged for generations to Deborah's maternal ancestors. The mother has made a runaway match with a brilliant but irresponsible English subaltern of gentle birth. Upon the early death of her parents, the child has returned to the farm, and grown up under the care of an aunt, the incumbent of Tod's. Deborah has inherited the thrift and industry of her humbler forebears, and after the aunt's death, when she becomes owner of Tod's, she continues to live there, busy and contented as mistress and manager of the estate. To her, in her twenty-sixth year, comes by chance a retired officer, Gen. Sir Arthur d'Alton, who was formerly in command of her father's regiment. He is, in point of fact, an ancient dandy and rake, but in his rôle of the father's commanding officer, and, as she discovers, benefactor, he becomes glorified in her eyes. She takes his philandering seriously, and regards herself as betrothed to him by the token of a random caress. His discovery that she is a considerable heiress reconciles the impoverished old gallant to this silly error, and he marries her. Her eyes are quickly opened to his character and to the hollowness and corruption of the fashionable city life with which she is obliged to come in contact, but she devotes herself to the care of his decrepit person and disordered household till his death leaves her free to go back to her asylum of Tod's. She does not, however, find peace there, for the amiable lord in question has long since cruised in out of the offing and come to fairly close quarters. He presently runs alongside and everybody is happy.

In stories like this, with their naïve waiver of those psychological and pathological problems which encumber our fiction, there is much to content and soothe, if not profoundly edify, the old-fashioned reader who resents, now and then, the increasing claims of the story-teller to be guide and philosopher as well as friend.

The Forest Playfellow. By E. K. Sanders. New York: E. P. Dutton & Co.

The theme of a lonely child and a ghostly playmate has been worn wellnigh threadbare by much handling, but the author of "The Forest Playfellow" brings to the task a tenderness and simplicity that set the story beyond the charge of triteness. The little volume is as unpretentious in its style as in its binding; nothing about it suggests a bid for loud and ephemeral popularity; but one may venture the hope that after sixty times Six Best Sellers have shouted themselves into second-hand bookshops, "The Forest Playfellow" will still stand on many a Beloved Shelf, shabby with much cherishing by old and young who have felt themselves lonely children.

By Veldt and Kopje. By William Charles Scully. London: T. Fisher Unwin.

It cannot be said on the basis of these sketches that Mr. Scully is entitled to place in the first rank of British Colonial chroniclers. Material is apparently as abundant in South Africa as in India or Canada or Australia, but as yet no Kipling or Parker or Lancaster has given it saliency. "The Story of an African Farm," written long before the Boer War, has hardly been supplanted by later interpretations of life in South Africa. Most of Mr. Scully's stories have found acceptance in magazines and newspapers, and they are more than ordinarily acceptable as such material goes. They are remarkable in not dealing with the triumphant Briton in exile who is commonly celebrated by the Imperialist chronicler. Mr. Scully is interested in the Boer, the Kaffir, and the European who finds himself in natural human contact with them. The matter of political or racial supremacy does not excite him. One of his heroes is a filthy and barbarous Hottentot, who delights in torturing birds and small animals, yet gives his life for a little English boy, whom he adores. Another is a young Kaffir chief, who prefers a noble death to an ignoble one; another is an old blind Boer, who has attained the serenest philosophy by way of a soul-shaking experience. Least successful are two or three tales about imported Britons, in which the author's attempt at humor results in mere facetiousness. About the workmanship of most of these stories, indeed, there is a sort of crudity, a smug amateurishness, which marks them as really provincial. What atones for this defect of mode, and makes them on the whole worth perusal, is the evident sincerity and sympathy of the mood in which this writer approaches his interpretations of the native life as he has seen it.

Adam's Clay. By Cosmo Hamilton. New York: Brentano's.

This is a book which presents a not ungrateful challenge to the critic whose lot it is to deal with the "ordinary run" of English and American fiction. It is, at all events, not dull. Perhaps one may best suggest its quality by naming it a story not for the young person: it has precisely that Gallic attribute of ineligibility. By this we do not mean the absolute worst; it is not a sheer deliberate salacity, framed for the indecent amusement of those who leer and giggle. Indeed, nothing actionable really happens; it is only that the mind and heart of a brutal coquette are stripped naked, and that the author appears, according to the French mode, to be quite as much entertained as shocked by the spectacle. If the story is not dull, it cannot be dismissed as flippant. With all his air of satirical rogue about town, his insouciance in showing up the good fellow and the pretty woman who know how to play the brute under the cloak of good manners, Mr. Hamilton has more insight and body of doctrine than the ordinary heavy-handed moralist in fiction. He is obviously under no stress of determination to be portentous or searching. His story tells itself with a swiftness, spontaneity, and neatness which are so familiar in the fiction of the Latins, and, alas, so rare in our own.

The principal persons are a young farmer, an English naval officer and his wife. The woman, a pretty, discontented, middle-class provincial, has married the officer for the sake of freedom, knowing that after the honeymoon his duty would entail a three years' absence. Lovely and innocent in appearance, she is a vampire, whose single delight is to prey upon the passions of men. For three years she amuses herself to the top of her bent, when the impending return of her husband makes it necessary for her to disentangle herself from a particularly loathsome (though legally blameless) intimacy. She retires to a little village to await her spouse, and enlivens her tedium by enslaving the young farmer. Her progress with him and her general philosophy of life are recorded in a series of letters written to a friend in London, who is (and whom, delightful thought! she knows to be) a former mistress of the husband. He gets hold of these letters, and learns her real character. She is cast off both by him and her young lover, and calmly puts herself under the protection of the man whose morbidity had interested her. For its directness, simplicity, and ruthlessness, this study of the social wanton is remarkable. Juvenal's evil women were not stripped more bare. A healthy taste will add that, without something more of Juvenal's *sæva indignatio* than Mr. Hamilton exhibits, fiction is scarcely justified in dealing with such a theme.

The Literature of Roguery. By Frank Wadleigh Chandler. 2 vols. Boston: Houghton, Mifflin & Co. $3 net.

If the reader is induced to undertake these volumes of Professor Chandler's (in the series of Types of English Literature, edited by Prof. W. A. Neilson), in the hope of arriving at a clear definition or tracing the development of a distinct literary *genre* or "type," he is doomed to disappointment. Professor Chandler is indiscriminate in the treatment of his subject. He includes much material which has little or nothing to do with literature and is of interest only to the antiquary or the sociologist—jest books, for instance, and prison tracts and "repentances," or actual reports and studies of vagabondage or the like, composed with a statistical or scientific purpose. At the same time he seems to feel sufficiently justified in enclosing in his *cadres* any book whatever, if it happens to contain a rogue of any sort, no matter what its general character. So Shakespeare's "Henry IV." and Scott's "Ivanhoe" find themselves in the same category with "Don Quixote," "Gil Blas," and "Tom Jones" as kindred of "Don Guzman de Alfarache." For the inclusion of such a story as "Vanity Fair" there may be more excuse. But it is obvious that the same principle would involve almost every modern novel or drama, and that there is a wide, an impassable gulf between even "Vanity Fair" and anything than can properly be spoken of as picaresque.

The fact is that Professor Chandler seems to have formed no very clear idea of the limits and *differentia* of his subject. To be sure, he points out that all this literature is marked as a whole by the presence of an "anti-hero," who is characteristically more rogue than villain. In the picaresque novel proper, which he carefully distinguishes from its derivatives, this anti-hero is the servant of several or many masters, the satire of whose vices or failings constitutes one of the principal motives of the story. In the later literature of roguery certain of these traits may persist—of them all, perhaps the vagrancy of the main character, as in "Tom Jones," has been the most obstinate and has done most to hinder the growth of the regular novel. In general, however, Professor Chandler insists that "rogue fiction . . . for the past hundred years has lived more or less apart from its origins." But unfortunately he fails to determine what are its constant and invariable notes, or ear-marks. Theoretically, indeed, it would seem clear that in a literature of roguery properly so-called, the rogue, or anti-hero, whose predominance distinguishes the type from every species of tragedy, must be treated with some degree of indulgence, if not with actual sympathy, under penalty of confusion with comedy; while in mitigation of the protagonist's rascality, society will come in for sufficient satire to keep the mood of the story distinct from that of romance. Such would seem to be the necessary requirements of anything like a *genre tranché*, a pure type; and some such characteristics would seem to have haunted the writer's mind in spite of the bewildering latitude with which he has gathered into his catalogue almost every variety of novel.

Nor is the evolution, the internal growth of the type, if there really be any such type, made much clearer. At most it is possible to name, after Prof. Chandler, certain popular elements which have contributed in one way or another to the final result. And in this case the mania for reducing everything to a popular origin seems more justifiable than usual. At all events, there can be no doubt that the popular mind has always been interested in the rascal and has always been confirmed in this taste by the "literature" which it most affects—to-day, the sensational papers, in the past the jest-books, popular tales, satires, and "characters." So established, the theme appears to have received two important developments—one by the criminal biography; the other by the "anatomies of roguery," including beggar books, cony-catching pamphlets, prison tracts, down to the modern sociological study. Exactly how these things ever grew into such literature as Borrow's "Lavengro" or what was the manner and mode of their influence we are not informed. When the author remarks that the link between such matters and the novel was supplied by Addison, he seems to think that he has done enough by way of explanation in adding that Addison borrowed from this literature of roguery. In this point, as in others, Prof Chandler, like so many scholars, is exceedingly keen in the hunt of origins without conceiving any intelligible relation between seed and fruit. For that reason his discussion is almost exclusively a *catalogue raisonné*, a list of all the rogues in English, with the titles of the documents and other "literature" in which they figure and a brief summary of their story. There is no criticism; no sense for the peculiar problems, ethical or other, suggested by the subject, such as the effect of romanticism upon the revival of interest in the picaresque; very little even of that research of literary comparisons so popular just now.

In short, the book is one big bibliography; and as such it is not without its value. To find an equal amount of material, arranged topically and chronologically in such a manner as to be easy of reference, would be impossible elsewhere. There are, of course, omissions; if Wilkie Collins is to be included at all, it is too bad to slight so accomplished a swindler as Capt. Wragge, in "No Name." While, on the other hand, it may seem as though a good deal of the lighter current fiction that is analyzed were hardly deserving of such serious attention. At the same time, it is only fair to remember that the first step toward the mastery of a new subject consists in a knowledge of just such facts as Prof. Chandler has accumulated; even though it must be added in the next breath that their selection and classification is no less important than their collection.

Father and Son: Biographical Recollections. New York: Charles Scribner's Sons. $1.50 net.

The name of the author is not given, but it is an open secret that he is Edmund Gosse. He offers the book chiefly "as a *document*, as a record of educational and religious conditions which, having passed away, will never return"; but also as "a study of the development of moral and intellectual ideas during the progress of infancy." The story is, in brief, "of a struggle between two temperaments, two consciences, and almost two epochs." The father and mother were orthodox, pious, rigid, extreme, members of that small sect known as Plymouth Brethren. They endeavored to keep their son in the same straight and narrow path. But since he was of a different type and belonged to a different generation, he was accessible to those ideas which have eaten like an acid into the old formulas of orthodoxy. Within fifty years the change in the point of view of Christians has been greater than in the preceding five centuries. This mighty unsettling has been accompanied by a bitter struggle between the adherents of the new doctrines and the old; and it is this vast conflict rendered concrete, personified in two admirably portrayed characters, that makes this book more interesting, as a mere narrative, than nine-tenths of the current novels.

The father and mother "dedicated" their son to the Lord when he was a babe of six weeks; and thenceforward they spared no effort to make his calling and election sure. The father was a naturalist who had travelled widely in pursuit of his profession, and who had won such repute as a careful investigator that Huxley referred to him as an "honest hodman of science"; but he parted company with Darwin and the progressives, and clung doggedly to a literal interpretation of the account of creation given in Genesis. He even wrote a book, the theory of which "was defined by a hasty press as being this—that God hid the fossils in the rocks in order to tempt geologists into infidelity." The mother was also a writer, but of religious verse and tracts. The course of training through which these excellent people put their son seems almost incredible to-day. Fiction was strictly banished from the house; and the boy's reading was chiefly the Bible and works of devotion. The parents found pleasure "nowhere but in the Word of God, and to the endless discussion of the Scriptures each hurried when the day's work was over." They seemed never to understand why the little boy should not be equally absorbed in the Bible.

Many of the reminiscences of this singular childhood are very amusing—but under the surface humor runs the pathos of a young life cabined, cribbed, confined, and of the prayers and efforts of the parents tragically misdirected. Here is one typical story:

> My Father . . . assured me that God would be very angry, and would signify His anger, if any one, in a Christian country, bowed down to wood and stone. . . . I determined, however, to test the matter for myself, and one morning, when both my parents were safely out of the house, I prepared for the great act of heresy. I was in the morning-room on the ground-floor, where, with much labor, I hoisted a small chair on to the table close to the window. My heart was now beating as if it would leap out of my side, but I pursued my experiment. I knelt down on the carpet in front of the table, and looking up said my daily prayer in a loud voice, only substituting the address, "O Chair!" for the habitual one.
>
> Having carried this act of idolatry safely through, I waited to see what would happen. It was a fine day, and I gazed up at the slit of white sky above the houses opposite, and expected something to appear in it. God would certainly exhibit His anger in some terrible form, and would chastise my impious and wilful action. I was very much alarmed, but still more excited; I breathed the high, sharp air of defiance. But nothing happened; there was not a cloud in the sky, not an unusual sound in the street. Presently I was quite sure that nothing would happen. I had committed idolatry, flagrantly and deliberately, and God did not care.

And so the story moves on through delicious glimpses of the Punch and Judy show, through the eating of a Christmas pudding (Christmas was a wicked relic of Popery), through the boy's immersion and admission at the age of ten, "another infant Samuel," to the society of the Brethren. He talked so glibly that his elders and betters were "deeply cheered, and led far along their own heavenly path by hearing such accents fall from the lips of a babe and a suckling." But, in spite of this consecration, the temptations of the world were very alluring. With the other boys of the neighborhood, he was invited to a little party. His father said they must pray together, and ask God for guidance. The prayer ended:

> My Father, perfectly confident in the success of what had really been a sort of incantation, asked me in a loud, wheedling voice, "Well, and what is the answer which our Lord vouchsafes?" I said nothing, and so my father, more sharply, continued, "We have asked Him to direct you to a true knowledge of His will. We have desired Him to let you know whether it is, or is not, in accordance with His wishes that you accept this invitation from the Browns." He positively beamed down at me; he had no doubt of the reply. He was already, I believe, planning some little treat to make up to me for the material deprivation. But my answer came in the high, piping accents of despair: "The Lord says I may go to the Browns." My father gazed at me in speechless horror. He was caught in his own trap, and, though he was certain that the Lord had said nothing of the kind, there was no road open for him but just sheer retreat.

And so the rift between father and son gradually widened. When the lad went out to walk with a friend, the father would suggest some passage of scripture, "some aspect of God's bountiful scheme in creation, on which you may profitably meditate together"; but the boys were interested in other things. The final rupture came when the youth of eighteen went to London to live. He then preferred Keats, Shelley, Byron, and Scott to Dean Alford's New Testament in Greek, and Wood's "Continuity of Scripture." He would, or could, no longer tell his father that he was "walking closely with God," and that his "sense of the efficacy of the Atonement was clear and sound." Thereupon the father wrote, upbraiding him for "this dreadful conduct," wrote, not in anger, but in pain.

This is, with variations large and small, the history of many fathers and many sons. To readers of middle age it must recall vividly the trials of adolescence, and the faithful and sincere, but none the less futile, endeavor to put the old wine into the new bottles. There must, however, be few instances in which the strain has been so great as Mr. Gosse describes it; for most fathers are ready to allow for the different point of view, and trust the son, whose errors are intellectual rather than moral, to the uncovenanted mercies of God.

The Heart of Gambetta. By Francis Laur; authorized translation by Violette M. Montagu. New York: John Lane Co.

The heart of this book is the love-letters of Gambetta written to Madame Léonie Léon. Around them are grouped a certain amount of history, a larger amount of inference or conjecture, and a still larger amount of tearful sentiment by M. Laur. He is doubtless the stanchest of friends, and the most devoted worshipper of the memory, whether of Gambetta or of the woman that the great French orator loved; but as an historian, he inclines one to grieve—or laugh. The famous secret interview between Gambetta and Bismarck, which M. Laur had built up out of a few hints and guesses, was so mauled by Lucien Wolf and others that the author of the invention has apparently withdrawn it; at least, it is not included in this volume. But M. Laur's method is throughout too gushing to pass for that of sober history. He reminds one of a lachrymose Victor Hugo: "I wept. All France wept." The style is staccato drowned in emotion, and grows very wearisome.

The secret of Gambetta's romance with Léonie was well kept. But few of his friends had the least inkling of it. The different accounts of its rise and strengthening all agree that her fascination over him was great and persistent. These letters now come to prove it. They are impassioned, clinging, adoring, grateful—a nature which pulsed with life, pouring itself out day after day to a woman. There can be no doubt of the sincerity or depth of Gambetta's attachment to Léonie. But M. Laur pushes her ascendency over Gambetta to surprising lengths. She corrected his manners; she inspired his policies; she moulded his career. One hesitates about accepting all this. It rests on little but Gambetta's own glowing words: "My Léonie was the soul of those efforts." To draw from such phrases M. Laur's conclusions is to make an affidavit out of a love-letter. A man is not on oath in writing to his mistress, any more than in composing a lapidary inscription. A great passion absorbing a generous man naturally leads him to attribute all efficacy to the object of it. Examples of it crowd biographies. Think of Comte and his Clotilde, to take a French instance. One craves the letters of Héloise as well as of Abelard; but only a few of Léonie's are given, and these answer back feebly to the call of Gambetta's deep. There is no such proof, then, as in the Browning letters, of the marriage of true minds able each to sustain and satisfy the other's love. But bearing in mind the one-sidedness of the relation as here revealed, and disregarding most of M. Laur's sentimental embroidering, these letters of Gambetta must be taken as a real contribution to our knowledge of the man.

Newfoundland and Its Untrodden Way. By John Guille Millais. New York: Longmans, Green, & Co.

The author of this book, son of the artist, is himself an artist as well as writer, naturalist, and sportsman. He has written a life of his father, Sir John Everett Millais, and has also embodied the result of years of labor in "The Mammals of Great Britain and Ireland." In his modest preface to the present work he says that this is "a hunter's book"; but the reader who expects the usual dull tale of slaughtered animals, will be agreeably disappointed. Stories of the chase are here in plenty, but there is far more. It is in the first place an exhaustive description of an interesting animal, the caribou, illustrated at every point. Moreover, the volume is redolent of the forest and the stream, and the wild life of the woods. The style is pleasant and easy. The characters who move across his stage are all alive and vivid: the Newfoundland guides, Bob Saunders and Jack Wells, the Mic Mac Indian Joe Jeddore, and Mike, the ten-year-old station master and telegrapher. The numerous pictures are admirable.

Though the book is largely concerned with the Newfoundland caribou, it contains much interesting information about Newfoundland and its inhabitants, including the Indians. To the average Englishman or American the island is inseparably connected with fogs, dogs, and bogs, just as Africa is "a mass of lions mixed with sand." But as described by Millais, Newfoundland is a most attractive place, with its thousands of lakes and pools, picturesque streams teeming with salmon, trout, and onananiche, great open moors, and marshes dotted with the ever restless herds of caribou. For its size Newfoudnland today holds more of these animals than any other part of the world. It contains dense forests of varied and beautiful trees. Its wild seacoast is inhabited by thousands of sea birds. All these things contribute to make the island one of the most delightful of wild countries to the sportsman and the lover of nature.

> Here in these forests and barrens, with their natural sanctuaries, the caribou are holding their own—one of the few instances where the purely wild game of Europe and America are not decreasing.

The reason why the great herds of caribou still remain in thousands undiminished is not far to seek. The island, larger than Ireland, is one vast deer park, wholly uninhabited. Indeed, Millais was the first to survey and make a map of a portion of the interior.

To many readers one of the most important chapters will be the description of the Mic Mac Indians. While Millais is lavish of praise for his Newfoundland guides, extols their cheerfulness, and their endurance, he gives the palm to the Indians for their skill as canoe men and as pilots in the wilderness. Consumption and the trader's rum are playing havoc with this fine race. In one drunken spree they often waste the earnings of months of toil. The law forbids the sale of liquor to Indians, but in the far-off outposts the law is a dead letter.

One of Millais's objects in coming to Newfoundland on his fourth trip was to study whales for the third volume of his "Mammals." His great desire was to get a picture of the greatest monster of the deep, the blue whale, and nothing in the book is finer than the story of the capture of this leviathan:

> It was a moment of intense excitement when the two finbacks rose right in front of the bows and within easy shot, but the captain and I were gazing fixedly into the green and clear depths looking for the blue whale, when far away down beneath the water I saw a great copper gray form rising rapidly right underneath the ship. The captain signalled with his hand to the man at the wheel on the bridge, turning the vessel off a point just as the ghostly form of the whale growing larger and larger every moment until it seemed as big as the ship, burst on the surface beside us and broke the water within ten yards. In a moment we were drenched in blinding spray as the whale spouted in our faces. I turned my arm to protect my camera and to click the shutter as the captain fired the harpoon gun. The latter planted the harpoon fairly in the great creature's lungs. After 500 yards had run out, a great commotion was seen in the sea, the next instant the whale appeared rolling and fighting on the surface. It lashed the sea into white spume with its flippers, and frequently raised its head right out of water, opening its immense jaws. Its struggles only lasted about two minutes.

The Norwegian of to-day, fine sailor and whaler, is the direct descendant of the bold Northmen who discovered America five centuries before Columbus, who conquered Normandy and ruled England. In like manner the Newfoundlanders, whose fathers came from the west of England, companions of Drake and Raleigh, are to-day the men selected by Peary for his Arctic expedition—the only race of daring seamen who can hunt the hair seal on the ice floes. One other feature of the islanders' character is their bandiness. They build their own boats and houses, tan their own leather, and make their own shoes. This peculiar gift of handicraft is inherited. All the first Newfoundland settlers were winter crews of skilled mechanics—carpenters, sawyers, blacksmiths, etc.—left behind to prepare the work for the fishery.

To all who wish to know about Newfoundland and her attractions for the tourist, the man of business, or the sportsman, we can strongly recommend Millais's book. It is the best work that has ever been written on the natural history of the island.

A Year in Russia. By Maurice Baring. New York: E. P. Dutton & Co. $3.50 net.

The Red Reign: The True Story of an Adventurous Year in Russia. By Kellogg Durland. New York: The Century Co. $2 net.

As the number of books on contemporary Russia continues to grow—and there is already a respectable literature dealing with Russian history since 1904—it becomes possible to divide them into two distinct classes. There is the volume which deals with those dramatic features of a revolution which naturally come close to the heart of the journalist, and there is the volume which treats of those causes and presuppositions of historic events which appeal primarily to the student. The second class is by far the smaller, and it is not increased by the two works under consideration. Mr. Baring's year in Russia covered the eventful period between August, 1905, and August, 1906, but the book pretends to be nothing more than a jotting down in diary form of hearsay, impression, and casual observation, and as such can possess little permanent value, especially in the presence of more elaborate and systematic presentations of the same subject.

Mr. Durland's account of his adventures within the Czar's empire in 1906-7 is a far more commendable piece of work. In fact, within its own class, it is probably the best book on présent-day Russia that has so far been written, for completeness, clearness, and picturesqueness of treatment. In differentiating it from the kind of book that would appeal to the serious student of Russian history, we do not mean to imply that Mr. Durland's story is merely one of battle, murder, and sudden death. Non-spectacular political and social questions are far from being neglected, and a satisfactory picture of Russia's moral state is also presented. At the same time, the point of view is intensely and avowedly anti-governmental, and no attempt is made to study the present situation in the light of Russia's history and institutions after the fashion of, for instance, Bernard Pares's "Russia and Reform" (see *Nation* of October 10, 1907, p. 332). The author's intimate relations with the most active of the revolutionaries has, however, enabled him to seize what may be called the soul of revolutionary Russia, with convincing appreciation. His account of the events that preceded the Kronstadt mutiny of the summer of 1906 makes the best reading in the volume, because of its insight into the blending of the spirit of martyrdom, of youthful recklessness, and naïve delight in conspiracy which is the motive power behind a large section of the Russian "Intelligence."

The Caucasus, the Baltic provinces, the revolutionary south, the pogrom centres, the capitals, the peasants, the city workmen, and the Duma, all receive more or less adequate mention.

Science.

Henry Frowde has ready for publication the Fitz-Patrick Lectures, delivered by Dr. Norman Moore before the Royal College of Physicians of London. They will appear as "The History of the Study of Medicine in the British Isles."

"The Book of Water-Gardening," by Peter Bisset (New York: A. T. De La Mare Co.), places within reach of amateurs the information necessary to establish and conduct successfully small and inexpensive water-gardens; and it gives directions also for the cultivation of aquatic plants upon the large scale demanded by parks and estates. The general features of preliminary engineering are presented with care, and the various accessories, such as windbreaks, etc., are treated sufficiently. By taking advantage of excellent photographic methods of engraving, the author has made his work most attractive throughout. The value of a book of instruction and reference like this is much enhanced by a full index, and perhaps one may be given in a second edition. Such an index would, no doubt, enable one to find what has been looked for in vain in the text—some reference to the intimate relations of the mosquito to water-gardening. The mosquito tones down the enthusiasm of many cultivators of aquatics, and a hint or two as to the proper management of the insect in places where it is impracticable to keep fish to consume the larvæ would be welcome. We suggest that the brief allusion to this serious drawback, on page 24, be somewhat expanded. Even the most cursory glance at the pictures will show how wide is the range of taste displayed by water-gardeners in this country. Most, though not all, of the plates indicate sound judgment and appreciation of beautiful effects.

In Part I. of Volume II. of "Trees and Shrubs; Illustrations of New or Little-Known Ligneous Plants," prepared chiefly from material at the Arnold Arboretum of Harvard University, and edited by Charles Sprague Sargent, director of the Arboretum (Houghton, Mifflin & Co.), twenty-five species are described and illustrated. To those who know the excellent quality of Professor Sargent's "Silva of North America," and who have followed his later contributions, no commendation of the present treatise is necessary. In all respects the continuation of his great work is on the high level of what has gone before. Charles Faxon's delineations are perfect as to detail, and as to stereoscopic effect, and indicate the power of a line drawn by one who knows exactly what he sees. It is difficult to be reconciled to the loss of *Garden and Forest*, in which Professor Sargent and Mr. Faxon were making frequent and more easily accessible contributions to the knowledge of our ligneous plants. Certainly the numerous garden magazines, illustrated copiously by photographic processes and filled with descriptions which seek to avoid all savor of technical language, do not fill the place occupied by the vanished journal. *Garden and Forest* was educative from the first, and of immense importance in guiding taste. Fortunately the energy which gave to that journal its distinctive character is in its new channels doing high service to science.

A new astronomical journal, *Gazette Astronomique*, has been established at Antwerp. It will contain some popular articles.

The Fourth International Mathematical Congress will meet at Rome April 6. The four divisions are: (1) Arithmetic, Algebra, Analysis; (2) Geometry; (3) Mechanics, Mathematical Physics, Geodesy, Applied Mechanics; (4) Philosophy, Historical and other Questions.

The senate of Cambridge University purposes to celebrate in 1909 the hundredth anniversary of the birth of Charles Darwin and the fiftieth anniversary of the publication of "The Origin of Species."

Students of science and admirers of the late Lord Kelvin will be glad to know that F. Gutekunst of Philadelphia has published a large portrait of him suitable for framing.

The death is announced of Lieut.-Gen. Sir Richard Strachey, at the age of ninety-one. His life work was done in India, beginning as far back as 1836. To him was chiefly due the extension of railways, canal, and irrigation works in that land. He was a member of many scientific societies and commissions, and he published "Lectures on Geography"; and "Finances and Public Works of India" (with his brother, Sir John Strachey).

Dr. Karl von Voit, celebrated physician and physiologist of Munich, has just died at the age of seventy-six. His principal discoveries were in the field of metabolism; as early as the age of twenty-six he had shown that an animal's proteid metabolism can be measured by the amount of nitrogen in its excreta. His doctrines attracted much attention and have been the cause of many controversies between the "Munich school" and the advocates of other views; nor can it be said that a final conclusion has been reached To the last Voit edited the *Zeitschrift für Biologie* which he had founded with Buhl and Pettenkofer many years ago.

Dr. Johannes Friedrich von Esmarch, professor of surgery in the University of Kiel, died February 23 in his eighty-sixth year. He was director of the surgical faculty in hospitals of Berlin during the Austrian war and surgeon-general during the Franco-Prussian war. Among his works are "Beiträge zur praktischen Chirurgie," "Verbandplatz und Feldlazar," "Kampf der Humanität gegen die Schrecken des Krieges," and "Handbuch der kriegschirurgischen Technik."

The death is also announced of M. A. Lancaster, chief of the meteorological department of the Royal Observatory of Belgium at Uccle.

Drama.

THE PARIS THEATRICAL SEASON.

PARIS, February 8.

The Paris season at the theatre has proved unusually worthy of note. It has markedly strengthened the bond, which, in modern France as in ancient Greece, unites and all but identifies the drama with literature. Acted or read, the works of Euripides were at once plays and poems, just as Paul Bourget and Gustave Geffroy and even Paul Margueritte purge almost too violently our own passions, political, social, religious, with pieces which primarily were novels. Even the engrossing stage art of Sardou is used to set forth intensely human anecdotes of French history, with scenic archæology. And what is now the passing comedy of playwrights like Alfred Capus and Tristan Bernard may still give pleasure to lovers of past literatures when a fuller civilization than our own is raging in some Chinese Hinterland, just as we ourselves delight in recovered scenes of Menander. For the present, at any rate, these plays are business successes, and this assuredly shows a high average of literary cultivation among Parisians from lofty to low.

"Divorce," drawn from Paul Bourget's novel of that name by the author, with the help of André Cury, has a timely story. The plot in the book has been closely followed; but it is concentrated in the play with a stage talent which no one would have attributed to Paul Bourget. None of the characters expounds anything in the dialogue. From beginning to end there is scarcely a break in the march of the story—and of the ideas. The author prefers to say that this is no problem play, but only a *pièce à idées*. Characters, story, ideas rush us forward breathlessly, relentlessly, head and heart, to the situation which is the outcome of the play—and perhaps of life in the France of to-day. I can remember nothing like it in living dramatic authors, with the exception of Paul Hervieu. The wife of an utterly undeserving husband secures a divorce, and the right to their child. Soon she tears herself from her religious past by civil marriage with a violent, but honorable free-thinker, who cares for the son of her first marriage as he does for the daughter born to themselves; and he trains the boy's mind to his own ideas, leaving his daughter to the mother. Two things happen. The first communion of the little girl stirs slumbering deeps in the soul of the mother, who, like French women, lives and has her being in her children; she wakes to find herself shut by her second marriage into outer darkness from the religion with which she has striven to enlighten her child's conscience. Next, and this is the ridge of battle, her son insists on his right, his duty, to espouse a young woman obnoxious to both husband and wife. This girl, too, is noble-minded, principled, like all these protagonists of a conflict where sure religion is face to face with uncertain ethics; and she has already followed out her free thinking by a free union, not religious and not civil marriage, with another whom she has left because he proved as unworthy as did the first husband in the marriages. This consequence of free thought is too strong for the young man's stepfather, if that is his correct title while the real father is still alive; for the free-thinking father has destroyed in himself the religion, but not the conventional morality, of society around him. But the young man is inflexible: "You married my mother after she had had a child—myself—by another man still living. Why shall not I marry Berthe, who is in the same position?"

Here we have a startling dilemma—must France, in practice, choose between indissoluble Christian marriage and unions of free love dissolved at will? The presentment of this question in the play has troubled the Parisian conscience beyond all that would have been believed. The radical critic, Ernest-Charles, accuses Paul Bourget of "gross sophistry—he calls moral what is only an abolished belief, a superannuated social convention." But even Ernest-Charles has to acknowledge that Paul Bourget has suppressed none of the very human thoughts and emotions which may honestly exist in all these lives swayed by conflicting principles: "The doctrine is inhuman, barbarous, antisocial to such a degree that the public was revolted and declared itself partisan of free union." The truth is that, save in Gustave Geffroy's play, which is also of this year, such uniform interest, with so conflicting applause for both sides, had not been provoked in Paris theatres since the "morale indépendante" of Dumas' "Natural Son," and Sardou's "Thermidor." Every one recognizes that the crucial point in divorce is the fate of the children of the first marriage. Alfred Naquet, author of the French divorce law, says openly in the newspaper symposium started by the play: "Let the state take care of the child." Paul Margueritte, without heeding the child, has long carried on a campaign to enlarge the present law by making divorce possible at the will of one only of the parties—thus favoring more and more the individual as against the family, which is Paul Bourget's, and, indeed France's, traditional social unit. Probably all thoughtful men to-day agree with the real conclusion of novel and play: "It is folly to expect to conciliate all the traditional virtues in the world of the past with the system of ideas which is most contrary to such virtues."

"L'Apprentie" of Gustave Geffroy excited even a greater storm of applause and counter-applause as the varying sentiments of the characters were brought out. People rose up in their seats to declare that this is true; and others contradicted them. It was once more the two Frances of real life, shown truthfully on the mimic stage. The piece is described as an historical drama. It is in reality a succession of scenes, of which nearly half portray the rise and fall of the Paris Commune, while the others follow out the tragedy in the lives of one Communist family twenty years later. Gustave Geffroy, like Antoine, who has staged his play superbly, was old enough to make his own observations at the time and, what is more, inhabited the workmen's quarter of Belleville. He was later one of the young men of Clemenceau the editor; he has headed the movement which brings to the artisan instruction in the fine arts, of which Gustave Geffroy is an able critic; and he has just been named to the high post of director at the Gobelins. There is a touching air of sincerity about all his writing. The book from which the play has been taken is superior in style, in fairness, in all that should make for human interest, to Zola's "Débâcle"—and has had, perhaps, one-tenth the sale. Those who know that there are two sides in every historic tragedy cannot afford to ignore it when they attend to the Paris Commune. The ensuing family tragedy is a Labor incident, with the one sister swallowed up alive in a selfish world and the other left to struggle alone and with no prospect of aid or recompense from society as it exists.

"L'Autre" of Paul Margueritte is in line with the campaign which he carries on unweariedly in favor of allowing one of the partners to dissolve the dual contract of marriage. The play is dramatic and as literature is of high order—but it is uncomfortable in bringing out what is often the truth, that husbands are responsible for their own matrimonial misfortunes. It is, of course, a *bourgeois*, capitalist, property-owner's play, of and for the middle classes.

Sardou's play—"L'Affaire des Poisons"—has a heightened interest from the controversy into which it has plunged him with Frantz Funck-Brentano, whose documentary book on the subject is the latest authority. There are still people who doubt the complicity of the Duchess de Montespan in the "black masses," although most follow the Puritan jury of the Maybrick trial, that when adultery is proved murder shall be the verdict.. The play dwells only on the murder part—the wholesale poisoning in which the King's mistress took part only to keep the royal affections. The controversy deals with less dramatic and more contested points: Did Louis the Fourteenth keep his hat on his head when a lady dropped him an official courtesy? Did he send to the galleys by *lettre de cachet?* Were his galley prisoners treated, as Professor Lavisse says, to "worse horrors" than are retailed of ancient slavery? And did the Grand Monarque sacrifice innocent lives for state reasons—the famous "raison d'État" which cropped up to the amazement of us all in the republican Dreyfus trial? Certainly Victorien Sardou, old as he is, hits back hard. Not for nothing has he passed a good part of a century in finding out the picturesque details of the dramas of French history. It was he who started on his way the chief of all such documenters—G. Lenôtre.

As Racine has been mixed up in the Affair of Poisons, it is right to notice this year's series of lectures on his life, friends, and work, by Jules Lemaître. Last year this lecturer, by what is now his book on Rousseau, drew out an answer from government. This time he shows himself a Sainte-Beuve redivivus. S. D.

It is a significant fact, that while in this country and in England the prevailing belief seems to be that a national theatre can be established only by means of large subventions and general coddling, Ireland, in her distress and poverty, with nothing but patriotic aspirations to support it, has actually started the institution about which everybody else has been talking, and has shown how a thing may be done by doing it. For there can be no doubt that this Irish National Theatre Company, some of whose members are now performing in the Savoy Theatre here, is exactly what it claims to be. It is rather a feeble affair as yet, with an uncertain future, but it has maintained itself for several years, and already possesses a repertory of plays, which are distinctly characteristic of Ireland and of no other country, and are, in many instances, remarkable for literary and imaginative qualities. The second play given here, Lady Augusta Gregory's "The Rising of the Moon," is of more substantial texture than "A Pot of Broth," but is really only a sketch. Three policemen arrive from a quay to look for a Fenian who has escaped from jail and for whose apprehension a reward of £100 is offered. Presently, the sergeant is left alone, and the fugitive appears in the disguise of a lame ballad-singer. He first allays the sergeant's suspicions, by telling stories about himself and volunteering his services to secure his own arrest, and then appeals to his sympathies, by discussing the accidents of birth and experience, and by singing proscribed Irish airs, in which the sergeant joins. Soon the latter is so softened that when his companion reveals his identity, he connives at the fugitive's escape in the boat which his friends bring for him. That is the whole story, and it is unfolded without the least attempt at dramatic effect, without one of the innumerable theatrical expedients which would suggest themselves to the least inventive of stage-managers. Considered only in the light of a theatrical episode, it is of the smallest value, but as a bit of real life, illustrative of the condition of affairs in Ireland, of the relations between the peasants and the police, and of Irish character, it becomes almost as interesting and instructive as it is veracious. Beyond question actors trained in the ordinary melodramatic school would make the incident much more theatrically effective than these Irish players do, but they would at the same time destroy its value as a human document.

The recent rapid succession of theatrical failures has brought to the front a number of young dramatists who are endeavoring to attract public attention by what they call a bold and frank treatment of indelicate subjects. Recourse to such expedients is a sign of weakness, not of strength. It is symptomatic of poverty of dramatic invention, and is but another phase of the crude sensationalism which, in professed melodrama, creates its shock by less credible and less objectionable methods. The latest specimen of these social "shockers" is a piece called "Paid in Full," by a new writer, Eugene Walter, which was produced in the Astor Theatre on Tuesday evening, and seems likely to fulfil its purpose in provoking comment. In some respects it is a rather notable work for a novice, as it exhibits capacity for character drawing, a sense of effective situation, considerable ingenuity, close observation of detail, and a mastery of realistic, lively, but utterly unliterary dialogue. On the other hand, it is tricky, extravagant, and uncertain in purpose, and in some of its incidents alike repulsive to good taste and common sense. Beginning with some pretence of offering a study of socialistic and plutocratic phenomena, it speedily resolves itself into the portrayal of a singularly base and selfish, but indisputably consistent and vital character, that of the hero, who, having robbed his employer, tries to save himself from prison by the barter of his wife's honor. From this unspeakable infamy he is saved by the purity and courage of the latter and by the generosity of a man, who, for clumsy theatrical ends, had been represented as a monster of cruelty and lust. The juvenility of the work is manifested in surprises of this sort, which are purely arbitrary and devoid of dramatic logic, and in the radical improbability of the main premise that such a strong, self-respecting, and keen-witted woman as the heroine is represented to be, could ever have been inspired to devotion by so transparent a blackguard as her husband. Unquestionably the play shows ability and signs of promise, but it is sadly lacking in moderation, judgment, and reticence, teaches no lesson that is not trite, serves no good purpose, and is, therefore, in spite of some striking scenes, of small account artistically. For the young, it is in many respects an undesirable exhibition.

Bella Patemann, the actress who died recently in London, was an admirable performer in her day. She was well known in this country, where she at one time supported Edwin Booth. She made a popular hit as Mercy Merrick, in "The New Magdalen," and another as Lady Clancarty. She also won success in "Proof," a version of the play known here as "A Celebrated Case."

Music.

Bizet. Von Adolf Weissmann. Berlin: Marquardt & Co.

What is to be the future of French operatic music? Will it follow in the footsteps of Debussy, whose "Pelléas et Mélisande" is the sensation of the week, or will it take Bizet's "Carmen" as its starting point? Adolf Weissmann has no doubts on this subject. To him Debussy is an impressionist, who would substitute vagueness for the definite outlines and the clearness of style which are of the essence of French music, whereas Bizet represents the perfection of that style. His "Carmen" is the apex of all French music. Nietzsche proclaimed it a trump which would take all the Wagner cards; and while this was exaggeration, it is certainly true that Bizet proved by his opera that the established form of patterned melody is as compatible with the demands of a true music drama as Wagner's "endless" or continuous melody.

That the Parisians failed to see this, that they actually accused Bizet of being a follower of Wagner, and that this was one reason why "Carmen" failed when first produced in 1875—these are among the strangest facts in musical history. Several other reasons why the opera did not succeed seem almost as strange. The traditions of the Opéra Comique demanded that the gypsies should be adapted to French ideas, that Carmen should be a model of purity, and that she should not die at the end. The orchestra found not a few pages of the score unplayable and the chorus balked because it had to act as well as sing. The report went forth that "Carmen" was so immoral that fathers could not take their families to see it. Thus prudery, hypocrisy, and ignorance combined to bring about the fall of a great work of genius. Whether the predominance of Spanish local color in the play and the music contributed to this result is doubtful. Exotic coloring of the crudest sort did not prevent Félicien David's "Lala Roukh" and "Désert" or "Délibes's "Lakmé" from pleasing the Parisians; and Bizet's exoticism is much more subtle, and modified by his individuality. As our author remarks, the actual Spanish melodies included in the score "are so thoroughly saturated with the personality of Bizet that the Spaniards had to accustom themselves to recognize in them their own flesh and blood."

Weissmann seems to have had two main objects in writing this short life of Bizet—to sing a pæan on "Carmen," and to call attention to the fact that Bizet was not a "one-opera man." The general impression is that "Carmen" came into the world like a meteor, but the author shows by a careful analysis of Bizet's earlier works that there is in them much music for the future, and he pleads for performances of the "Pêcheurs de Perles," the "Jolie Fille de Perth," "Djamileh," and, particularly, the glorious "L'Arlésienne" music, in connection with Daudet's drama. Weissmann's book should be translated into English at once. We need a good biography of Bizet.

When the audience at the first American performance of Debussy's "Pelléas et Mélisande," at the Manhattan Opera House, called out Oscar Hammerstein after the fourth act, he said that his one object in presenting this opera had been to endear himself to the public, and to perpetuate himself in its memory. Whether he will endear himself remains to be seen, but his undertaking is certainly memorable for its daring. Debussy's score is seven years old, and while it has been sung more than sixty times in Paris and seventeen times in Brussels, no other city except Frankfurt has dared to produce this strange, gloomy, and difficult music-drama. Mr. Hammerstein reduced the chances of failure—but also greatly increased his expense—by bringing over from the Opéra Comique nearly the whole cast that had won success for the work in Paris and Brussels—Mary Garden, Gerville-Réache, Jean Périer, and Hector Dufranne; and he had in Cleofonte Campanini a conductor who proved his ability to do full justice to the intricate and extraordinary orchestral score. This score is musically of much greater importance than the vocal parts; for whereas Wagner maintained that in his operas the orchestra, with all its complexity and fulness, is nevertheless a mere accompaniment to the singing voices, Debussy deliberately banishes melody from his vocal parts, making them mere recitative, or declamation. This boycotting of melody seems likely to prove the fatal weakness of Debussy's work, for it is infinitely easier to write recitative than original melodies or tunes. It is also much easier to write an orchestral score like that of "Pelléas et Mélisande" than one like "Tristan and Isolde." In Wagner's opera every bar is organically connected with the bars preceding and following it, whereas in Debussy's anarchy prevails. He scorns the laws of harmonic and contrapuntal concatenation as he despises vocal melody; his chords and groups of chords follow one another quite at random. This constitutes the essence of his unique musical personality. Its tang is intensified by the frequent use of the mediæval church modes in place of the modern major and minor. His great reserve in using the modern orchestral opportunities for dynamic climaxes is another peculiarity which can hardly be called a merit. When the music does rise to a climax, as where the jealous Pelléas maltreats Mélisande, or in the murder scene, it becomes thrilling. The best thing about Debussy's talent is his ability to adapt his music to the atmosphere of the play which it intensifies. In this respect his opera is worthy of Wagner himself. Debussy's music fits Maeterlinck's play like a glove.

Puccini's next opera will be on an American subject, a musical setting of Belasco's "The Girl of the Golden West," and Americans will probably be the first to hear it. The composer hopes to have his work completed by the spring of 1909. The opera will be in three acts, the last, however, differing considerably from the American original. Besides that of the protagonist, there will be two big parts—one for tenor and the other for baritone, and about fifteen less important rôles. The chorus, consisting entirely of men, will appear only in the last act.

Art.

Die Plastik Sienas im Quattrocento. By Paul Schubring. 256 pp.; 156 cuts. Berlin: G. Grote.

If there ever was an art the quality of which was unplastic, it was the art of Siena. Byzantium itself was scarcely less productive of graven images. To be pictorial, and, in a minor sense, decorative, was the accepted ideal, and the sculptor was wanted only when his work seemed to be indispensable. When there was need of a fount to contain water, an angel to support a candle, a pulpit to exalt a preacher, Siena turned perforce from the gilder of panels to the carver in stone or bronze. But even here the opportunity of the sculptor was limited. There is no storied bronze door in Siena, statues on the façades of her palaces and churches are exceptional, even portrait tomb slabs are rare. As for independent portraiture, it may hardly be said to exist. The few examples attributed to Sienese artists are of doubtful provenience and workmanship. No Sienese sculptor except Jacopo della Quercia is a resounding name in the world, and although at different times Giovanni Pisano, Donatello, and the Robbias made splendid works for the City of the Virgin, these seem to have had only the slightest effect in creating a taste or a demand for sculpture. To study the plastic art of Siena in the fifteenth century is accordingly to follow a byway; an investigation, say, of the sculpture of Holland would be quite as promising.

It is possibly this sense of the barrenness of the field that has reserved for Dr. Schubring the honor of writing the first history of Sienese sculpture in the Renaissance. But the task was well worth the pains. As a pioneer Dr. Schubring has naturally magnified his office, and perhaps the unwary should be warned once for all that Siena is not next to Florence as regards sculpture in this period. Venice and even Milan take precedence. And the same caution should be applied to his attributions which are too often of the merely hopeful sort. By such valiant efforts to increase the list Dr. Schubring has managed to find only ten sculptors with some hundred and fifty works for a century of Sienese sculpture. And this sparseness suggests both the scantiness and comparative insignificance of the material, and the necessary shortcomings of the book. The author has gone little beyond the material accessible in Siena at the time of the regional exhibition. Doubtless a more thorough search of private collections and dealers' stocks and a diligent tour of the regions in Tuscany and Umbria that drew their art from Siena would double the list.

Dr. Schubring has in any case provided a useful basis for such a definite study, digesting in accurate fashion the scanty material from published and unpublished archives, and reviewing all accessible examples of the sculpture. Abundant illustrations, many from the author's negatives, put one in a position to weigh the plausibility of most of the attributions. Upon these contentious matters we have no space to enter. The case of Francesco di Giorgio must illustrate, in lieu of many, the merits and defects of his method. By a very interesting and convincing argument, he reclaims for the versatile Francesco, the famous bronze relief of the Deposition, in the Carmine, Venice. This has usually been attributed to Verrocchio, and associated with the stucco relief of the Discordia, South Kensington, and the bronze Flagellation, in the Perugian University. The latter two Dr. Schubring ascribes to Francesco on the strength of similarity between their architectural backgrounds and that of a predella in the Uffizi, which is also ascribed to our master. But the resemblance seems quite casual. In both cases, probably, the artists have drawn upon the forms in Leon Battista Alberti's treatise. It is by no means evident that the South Kensington piece is by the same hand as the Venice relief, while the Perugian bronze seems surely of Paduan-Florentine origin. In short, if it is a gain to find the author of the Venice Deposition, this gain is largely offset by the attachment of two other doubtful works to his name. As for the bronze bust of Pontano, in the Palazzo Bianco, at Genoa, our author admits that there are no stylistic grounds for attributing it to Francesco. The ascription rests only on the fact that he worked in Naples and conceivably might have portrayed this humanist. One must protest also against the practice of printing such attributions under the cuts with no sign of doubt. In this matter Dr. Schubring is not a unique offender. The habit evidently tends to give too cheaply to a supposition the credit of fact, and a conscientious scholar should be as careful in regard to these captions as he is with the text itself.

We cannot part with Dr. Schubring's useful book without a word on Sienese sculpture in general. Like most things Sienese, its exquisiteness atones for its lack of high seriousness. In Neroccio and Giovanni di Stefano, we find that peculiar sensitiveness which is the most agreeable feature of the Renaissance. Few have excelled these sculptors in the gracefulness of poised angels perceived through fluttering draperies. And yet one recalls that the Florentine Agostino di Duccio did this same thing with more preciousness and fire. In Vecchietta, another Sienese, we feel the peculiar qualites of late gothic sculpture which make it drastic or tender as the mood serves. His scanty work then strikes a note rare in Italy, though common enough in France. Antonio Federighi, one feels, might have become a great sculptor had he had the luck of being exiled. Except Quercia he was about the only Sienese artist who read the importance of the new movement. But as usual the value of Siena lies not in her prophecies, but in the placid mood of retrospect which she knew so well how to hold. She represents to us better than any other Italian city the half pictorial charm of sculpture in painted wood or terra-cotta. Even more than marble and bronze these were the sympathetic materials for ecclesiastical sculpture, according perfectly with frescoed walls, colored vaults, and illuminated windows. For preserving so many examples of the polychrome sculpture which elsewhere disappeared before advancing neo-classicism, Siena, as in so many other instances of tenacity to the old, has the admiring gratitude of lovers of fair forgotten things.

Early in March Doubleday, Page & Co. will bring out a luxurious volume on "Country Residences in Europe and America," by Louis V. LeMoyne.

In Albert Forbes Sieveking's charming treatise, "The Praise of Gardens," Humphry Repton is properly given a place of honor as the first to employ the term landscape gardener. It is, therefore, right that Repton's early work, "The Art of Landscape Gardening," should have been selected by the flourishing American Society of Landscape Architects as the initial volume of their series of republished classics. The typographical execution, by Houghton, Mifflin & Co., and the editing, by John Nolen, are very satisfactory. The original work was published in 1794, in a rather clumsy form. The new issue avoids this clumsiness, but, through a felicitous choice of type, preserves completely the antique character of the original. The first edition was enriched by illustrations, which in some cases had a lifting leaf by which transformations in landscapes could be shown; one could see at every step the changes. Thus a broken forest with a commonplace foreground was turned into a noble park, or a sombre view was suddenly enlivened by the introduction of some fitting edifice. Repton's illustrations are here well reproduced, and are likely to give great pleasure to those who are fond of seeing what transformations can be brought about by comparatively simple means. Repton's career was varied. He is said to have failed as a merchant, and, later, to have lost much money in a mail-coach system, so that, if failure counts in the business of critic, he came well prepared to his task as a critic of natural and of artificial landscapes. Of the latter, he had many within easy reach. Lancelot Brown, who had carried all before him by his generally skilful management of natural factors, had made many blunders; but, worse than this, a school of gardeners had grown up around Brown who made havoc with numerous estates. Repton was a keen observer, who detected errors, and suggested ways of correcting them; hence his work, while possessing little originality, is often exceedingly suggestive. The reader will find many evidences of sound judgment and of consummate tact. It is fortunate that this stimulating treatise has now been made accessible to lovers of country life in America.

Dr. Wilhelm Dörpfeld's Fourth Report (January, 1908) summarizes his Leucado-Ithacan excavations of June and July, 1907. He describes several finds, all accompanied by monochrome potsherds of the most rudimentary handiwork. He has found a prehistoric sanctuary, superseded first by "Dorian" and last by Byzantine worshippers. Their successive handiwork also appears. Moving eastward toward the harbor of his Leucadian Ithaca, he has found in an olive-grove deep-level remains of a prehistoric garden. This reminds him of the τέμενος of Odysseus (Od. xvii., 299), because he has discovered in it traces of a prehistoric water-supply, which also served the city near by. No such supply is alluded to in the Odyssey as serving the τέμενος of Odysseus, but just such an one serves the gardens of Alcinous (Od. v, 293, 129). Not far away was found a prehistoric necropolis, which Dr. Dörpfeld regards as a characteristic Homeric barrow. He likens its burials to the shaft graves of Mycenæ, and to those of the "Achæan" sackers of the first and builders of the last Tirynthian stronghold. Finally, Dr. Dörpfeld was so lucky as to come upon what he confidently hopes must prove to be remains of the palace of Odysseus. Its main wall resembles those of the palace in Triphylia lately discovered by him. For anything like certainty another campaign is necessary, but in the meantime Dr. Dörpfeld warmly urges the suitableness of this site for Odysseus's house. The whole settlement he dates far back into the second millennium B. C., since he has found, but not published, sporadic Mycenæan shards with the primitive monochrome ware everywhere so abundant; but the settlement lasted, he thinks, down to the very verge of the first millennium, because this same "Achæan" monochrome pottery has been found on many Greek sites in association with "geometrical" ware. This year's attempts to find the grotto in the harbor of Phorkys have not met with success.

Seven members of the American Society of Miniature Painters have contributed fifteen pictures to the ninth annual exhibition open at M. Knoedler & Co.'s till February 29. Sixty-three outsiders send 112 miniatures.

Among the exhibitions in dealers' galleries in this city are paintings by the Barbizon and modern Dutch landscapists at Noé's, till February 28; paintings by Corot, Durand-Ruel's, February 29; pictures by T. W. Dewing and D. W. Tryon, Montross's, February 29; paintings by living American artists, Macbeth's, March 7.

At an auction at Christie's, London, February 8, the following prices were paid: Van Dyck, Portrait of a Gentleman on Horseback, £2,205; Lawrence, Duchess of Norfolk, in white dress, £961; Andrea del Sarto, Madonna and Child, with St. John, £682; Guercino, St. Gregory, seated on a throne, £367; Etty, The World before the Flood, £241; Rubens, Philip IV. of Spain, on horseback, £136.

Harriet G. Hosmer, the sculptor, died in Watertown, Mass., February 21. She was born in Watertown in 1830. After receiving lessons in modelling in Boston, she entered a medical college in St. Louis in order to study anatomy. In 1852 she went to Rome and became a pupil of John Gibson, the English sculptor. Her first full length figure in marble, completed in 1855, was Œnone, and this was followed in the same year by Puck, of which many copies were made. Next came a companion piece, Will-o'-the-Wisp, and in 1857 she exhibited her reclining statue of Beatrice Cenci, which is in the St. Louis Public Library. The colossal statue of Zenobia in Chains, was completed in 1859 and this was followed by the statue of Thomas H. Benton, in Lafayette Park, St. Louis. Among her other works are the Sleeping Faun and the Waking Faun, a statue of the Queen of Naples as the Heroine of Gaëta, a monument to Abraham Lincoln, and the statue of Isabella of Spain for the Chicago World's Fair.

Peter Janssen, artist and director of the Royal Academy of Art, Düsseldorf, has died at the age of sixty-three. His best-known work was as a mural and fresco painter.

SALISBURY'S
Physiography for High Schools
By ROLLIN D. SALISBURY, Professor in the University of Chicago. (*American Science Series, Briefer Course.*) viii+531 pp. Large 12mo, $1.50, *net.*

The primary object of this book is to cover the work in physical geography as given in the first or second year of the high school, but the author's clear and delightful style makes it more than ordinarily interesting for general reading. Like Chamberlin and Salisbury's Geology and Professor Salisbury's larger work on Physiography, it introduces the reader to the method of the science and leads him into the subject under discussion instead of telling him the conclusions already reached by authorities.

A striking feature is the abundance and effectiveness of the illustrations. Nearly 500 are provided, including half-tone photographs, diagrams and 24 colored plates. The plan of the book assumes that these shall be studied as carefully as the text itself and they are arranged with this in view.

SCHOOL ADVERTISING IN THE NATION

The Nation stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

The School List in *The Nation* has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation.

NEW YORK, THURSDAY, MARCH 5, 1908.

The Week.

Tariff reformers have been described as amiable dreamers. "Visionaries," they have been told they were almost as often as "doctrinaires." Hard-headed men in actual contact with the rude facts have said that it was all very well to take high moral ground about an iniquitous tariff, but plans for reform were absolutely impracticable. "My dear fellow, you don't know all the political ins and outs of the tariff as well as I do, and for you to imagine that duties can be changed, or the protected interests induced to yield anything, without a political convulsion and the ripping of business to pieces, shows that you are living in an unreal world." Well, unreality for unreality, and dream for dream, we would back the present Republican scheme for revising the tariff against the most baseless fabric of the reformer's vision. The whole thing is innocently set forth in Tuesday's New York *Tribune*, in a dispatch from its Washington correspondent. There are to be no "blasts of trumpets," but the Senate Finance Committee and the Ways and Means Committee of the House are to be authorized to set quietly to work during the recess. They will "conduct such examination into the tariff schedules as may be deemed wise." They will study the mass of "statistics" prepared by Treasury experts. There will be "no public hearings," no "widely advertised consideration of particular schedules to upset business and frighten importers," but just a plain, steady, business-like preparation, so that when Congress next meets it will find not only that the party is pledged to tariff revision, but that "a considerable amount of preliminary work" has been already done. This tale is idyllic in its simplicity. On what drowsy syrup have these Republican tariff-revisers been feeding? Have the woes and buffetings of the men who have in the past tried to reduce the tariff been wasted on the existing generation of politicians?

Translated into terms of hard fact, what would be the actual procedure of a tariff-revising committee headed by Senator Aldrich? Why, the protected manufacturers would be down upon it instantly, like a wolf on the fold. They would demand to be informed whether their particular schedules were being "examined." If so, the committee would be told bluntly that it had better drop the subject at once. And only think of these secret inquiries being held while a Presidential election is pending! More fat would be fried than schedules altered. It would be an unequalled opportunity for the tariff blackmailers. Granting that some sincere Republicans might be on the committee, are they prepared to meet manufacturers whose protection they propose to take away? Better encounter a lioness robbed of her whelps? The truth is that all this prediction of injustice and oppression and special privilege being expunged from the protective tariff without an open struggle is concentrated humbug. The country has been given these smooth prophesyings for years, and has come not to believe a word of them. In the March *Atlantic*, the historian, William Garrott Brown, writes strongly of the way in which the Republicans have played fast and loose with the people, in this matter of tariff revision:

> For six years we have waited in vain for President Roosevelt to affirm or to controvert the last and on the whole the most important announcement of policy President McKinley ever made. He has never moved in that matter, nor has he even explained why he does not move. And now, as his Administration approaches its end, the man whom he would have us take for his successor will go no farther than to reclare for tariff revision—after the election! That, of course, means after the election of a Republican President and Congress. It means, therefore, revision by a House of Representatives under the control of Speaker Cannon and a Senate under the guidance of Senator Aldrich.

In reality, the Republican party lies bound hand and foot in the tariff prison-house. The standpatters will not allow it to budge. Secretary Taft, seconded by President Roosevelt, goes again and again to Congress to get a little tariff mercy for the Filipinos, but is rebuffed every time. The protected interests feel that they own the party, and do not propose to permit it to venture upon the smallest beginning of justice. In view of their determined attitude, and the pitiable helplessness before it of the Republican leaders, the idea that tariff revision can be got furtively, as it were, and without any fight at all, is ludicrous.

With such detailed proof as comes from Virginia of officeholders running political conventions, how can the President fail to act? The dispatches give the names, not only of postmasters, but of rural-delivery carriers, leaving their work to help control a district for Taft. Mr. Roosevelt assured Mr. Foulke that he would not allow this to be done; yet here are his orders disobeyed just over the Potomac. If the President continues to turn his blind eye to all this defiance of his own commands and of decency, why does not the Civil Service Commission bestir itself? A part of its business is to prevent such violations of the law. Last year it restrained some North Carolina postmasters from meddling in politics. Cannot it now see as far as Virginia? We have quoted President Roosevelt's round assertion that "no government office should be used . . . for the purpose of electing delegates to a nominating convention"; and his declaration that the people should be left to manage politics "without interference and dictation" by officeholders. On what ground can his allowing that kind of thing now be justified? Possibly, the phrase of the Marquis of Zetland may help us. He recently attacked the Liberal leaders, because, he said, "they have not the moral courage to swallow their previous utterances." But President Roosevelt is unsurpassed for moral courage.

The favorable report on the Fowler currency bill by the House Committee on Banking and Currency brings that measure more definitely before the public. It is avowedly revolutionary, in the sense that it retires, under a rather unusual proviso, all of the banknotes at present based on government bonds, substituting new credit notes under an entirely new machinery; that it introduces the deposit-guarantee device; and that it opens to national banks the right to enter on the business now transacted by both the trust companies and the savings banks. With some of the innovations proposed by the bill we are heartily in sympathy—notably with the general plan for reversion to an asset currency. But whether such a plan can safely be complicated with provisions not essential to proper currency reform, and involving serious problems in altogether different fields, is another matter. Nor can we by any means agree with the statement that unless reform legislation is enacted at a moment when the panic shock has converged the public mind on currency problems, it will not be enacted at all. The whole history of our currency legislation proves the contrary. Had the measures proposed in the session following 1873 and 1893 been enacted into law, great harm would have been done, and wise currency reform would have been indefinitely retarded. So far was it from true, moreover, that failure to pass such measures in the immediate aftermath of those panics prevented further consideration of the problem, that the two greatest achievements of the past generation in currency reform—the Specie Resumption Act and the Gold Standard Act—came each to a vote in much more than a year after the panic of which, in a sense, they were the outcome. The one was passed in December of 1875; the other in March of 1900. Each was the product of thorough public discussion and of matured legislative consideration during the intervening period.

A Constitutional objection has been raised against the projects for forestry reserves in the White Mountains and the Appalachians. The immense forest reserves in the West were made for a specific purpose out of lands which the government already owned, at least in chief part. But the power to acquire for forestry purposes tracts now in private or State ownership is, it is contended, nowhere granted by the Constitution. The advocates of the plan reply that the power of the government over navigable streams involves the right to adopt any policy which is necessary to prevent or remove obstructions to our waterways. To those who think of forestry as merely the science of cutting down old trees and planting new for lumber, this may sound like a technical defence, justifying a great project of doubtful legality because one of its remote incidental benefits brings it under the Federal jurisdiction. In fact, the conservation of water courses is not a remote but one of the primary purposes of modern forestry. The best authorities believe that, with the denuding of the mountain ranges in which they arise, the rivers of New England and the South will lose a great part of their value to the regions through which they flow, becoming subject to flood and dearth alike.

In forbidding the payment of the "scrip dividend" declared by the Erie Railroad last August, the Public Service Commission goes to the root of things. The directors voted semi-annual dividends at the rate of 2 per cent. on the company's $47,000,000 first preferred and 4 per cent. on the $16,000,000 second preferred. The $1,596,000 requisite for the payment had been earned, but the directors, foreseeing that cash would be needed during the approaching period of trade depression, decided to pay the dividend, not in cash, but in scrip bearing 4 per cent. interest and redeemable in 1917. The Public Service Commission sweeps away all subtleties and points out that what the directors proposed to do was to put the company in debt for the purpose of paying dividends. Now, the law permits the incurring of such long-term debt for four purposes only—acquisition of property, extension or improvement of facilities, maintenance of service, and refunding of outstanding obligations. In the present case, none of these four purposes is proposed or would be attained. The company, as a company, gets nothing in return for the ten-year evidences of debt which it puts out. The "scrip dividend" is therefore forbidden. The wisdom of this decision cannot be fairly questioned. When the Erie directors voted the dividend, last August, their action was in principle a reversion to a vicious expedient, practised with unfortunate results in the haphazard railway finance of a generation ago. It is time for railway directors to learn that if it is not safe to pay a dividend, the dividend ought not to be paid at all.

If the proceedings in Superintendent Kelsey's case had been at all, as they pretended to be, judicial in character, ample time would have been given to Mr. Fleming to answer the allegations of Kelsey's counsel. As it was, but a scant twenty-four hours were allowed, and the matter had to be hurried to Albany, where it received not the slightest consideration. The Senate had its mind made up, irrespective of the evidence. Even in the short time at his disposal, Mr. Fleming was able to make a very damaging rejoinder to Kelsey's defence. He showed it to be full of evasion, misrepresentation, and garbling. By repeating some of the critical testimony taken at the inquiry, including Kelsey's own, Mr. Fleming heightened the general conviction that the Superintendent of Insurance has shown himself negligent and incompetent. But the Senate was notoriously governed in its action on the case by motives wholly personal and political. The pro-Kelsey men had "got the votes," and that was enough for them. Yet they confessed, in their very explanation of their plans, that they were doing something against the interest of the State. It seems that they finally "let off" two or three Senators, whose votes they could have had if need were, since these precious gentlemen are very anxious to be reëlected! The admission that the retention of Kelsey is a defiance of public opinion and of political decency could scarcely be plainer.

If anything could demonstrate the necessity for the provision suggested in the State Banking Superintendent's recent report, that the Superintendent himself be made the statutory receiver for insolvent banks, the recent performances of Attorney-General Jackson would do so. The actual condition of the Oriental and the Mechanics and Traders' banks may be in doubt; but what is not in doubt is that efforts were in progress to effect resumption without receivership, and thus relieve the hardships incurred by depositors. These efforts were conducted in coöperation with the Banking Superintendent, and the negotiations were still in progress when the Attorney-General suddenly interfered with a peremptory application for receivers, who were duly appointed by the court. No conference was had with the people who were at work on the plan of resumption; no time allowed, as in the case of the Knickerbocker Trust Company, to show whether or not the plan was assured of success. Even the Banking Superintendent, the one public officer who may be assumed to have been acquainted with the condition and prospects of the institutions, was ignored. Why was this done? The Attorney-General's public explanations are perfunctory. He had already, he declares, "delayed action longer than he should have done," and he thereupon consulted "a large stockholder" of the Mechanics' and Traders' Bank, at whose suggestion he "took steps." One of these "steps" was to secure the appointment, as one receiver, of the brother-in-law of this "large stockholder," and as another the Attorney-General's private secretary, a former newspaper reporter; these gentlemen then selected the "large stockholder" himself as counsel. In the case of the Oriental Bank, one of the receivers was a Tammany Hall member of whom the Attorney-General is reported as saying that he knows nothing of him, "except that he is a real estate dealer." Further comment is hardly necessary. The Attorney-General, however, had some further comment to make. "The powers of the Banking Superintendent," this eminent financial authority declares, "are too great as it is"; and the pending bill to place the receivership work in the Banking Department's hands, to the exclusion of the Attorney-General, is "a most dangerous and ridiculous piece of legislation"—in fact, "almost infamous in its nature." One can certainly sympathize with the honest indignation which must inflame a spoils politician at the prospect of losing rich political pickings from the misfortunes of depositors.

Artists complain of the lack of recognition of art in the United States. They often declare that they do these things better in France, where the national and municipal governments not only encourage the education of artists, but later nourish them with commissions. It is a tradition in Europe, handed down from the time when princes were almost the only dispensers of patronage, that artists of all kinds should look to the ruling powers. These having given the fashion, the nobles, the clergy, and the burgesses followed suit. It is a truism to say that the United States lacks such traditions, and that our artists have not only to work in rivalry with foreigners, but have to stimulate Americans to the point of wanting and buying objects of art at all. But the death of our foremost sculptor has been followed by signs of a deeper and more widespread interest than ever fell to the lot of an American artist. The memorial exercises at Mendelssohn Hall last Saturday afternoon, followed by the memorial exhibition of the works of Saint-Gaudens at the Metropolitan Museum, are honors of a kind generally reserved hitherto for distinguished soldiers and statesmen, or for popular heroes. A New Yorker from his earliest years, a pupil in our public schools and art academy, the sculptor of our fairest monuments, Augustus Saint-Gaudens is in all respects fitted for local honors; but it is safe to say that, at any time in the nineteenth century a man having all these titles to consideration would not have obtained such marks of esteem. That they are spontaneously offered to his memory indicates a change in the estimate placed on art in the United States.

Since it is practically certain that Prime Minister Campbell-Bannerman's poor health will soon compel him to give up the leadership of his party in the House of Commons, the Conservative newspapers are having a little fun over his possible elevation to the House of Lords. Could he as a member of that august assembly maintain a truculent attitude towards it? But this is to forget Lord Rosebery. He was Premier, though a member of the upper house, and in 1894 was as ready to take up a crusade against the Lords as ever Bannerman has been. Indeed, from the vantage ground of a seat in the gilded chamber, Rosebery has addressed some of his plainest truths to his brother-nobles. A situation which he could thus carry off, would surely not be beyond Sir Henry's adroitness and good humor. A more serious question is whether, even when relieved of the burden of leading the House of Commons, his strength would be equal to the labors of a Prime Minister. How great is the work and how severe the strain of that office, quite apart from the task of personally conducting legislation, few realize. A writer in a recent number of *London* shows how enormous is the load which the Premier has to carry in the way of correspondence and consultations and Cabinet meetings and public addresses. Some men go through it with more ease, or appearance of ease, than others. Mr. Balfour, with his golf and his agreeable manners and his frequent social engagements, seemed to show that a man might be Premier and yet have a good deal of leisure; but Balfour was always accused, even by some of his followers, of being too much at ease in Zion. A conscientious and hard-driving leader like Gladstone, or Sir Henry Campbell-Bannerman, cannot go through his necessary work without showing its marks upon him. The chances are good, therefore, that if the Liberal leader quits the House, he will also lay down the Premiership.

Sir Edward Grey's statement in the House of Commons casts no cheerful light on Macedonian conditions, unless there be comfort in the fact that it is no longer possible to conceal from the world how unhappy affairs are in that land. In the present uncertain state of feeling with regard to the position of the Powers, the British Foreign Secretary could bring forward no definite remedy. He was inclined to believe that if a Christian governor were appointed for Macedonia the problem might be solved, but the "if" in this case is a big one. For, if the European Concert cannot agree in forcing upon Turkey the execution of the meagre police regulations which were embodied in the Mürzsteg programme of 1903, it is hard to see how common action can be expected in a far more drastic reform. It will be recalled that at Mürzsteg the Austrian and Russian governments stepped forward as the mandatories of Europe for the pacification of Macedonia. It was a complicated system. The European Concert pushed on its mandatories; its mandatories, through their agents in Macedonia, were supposed to push on the foreign official gendarmerie in Macedonia; the foreign officers were to see that the Turkish police did their duty. But up to the present the Turkish police have not done their duty, because the foreign officers were practically helpless, because Austria and Russia were not as zealous as they might have been in behalf of the Macedonians. And now, with the new railway question, comes the final "because"—because the European Concert itself is going to pieces.

Contrary to expectations, the Polish land expropriation bill in its unamended form has passed both houses of the Prussian Diet. Prince von Bülow has once more shown himself a masterly compeller of majorities. Only a few days ago it seemed certain that the amendments brought forward by the House committee would be adopted. They would have meant the virtual nullification of the bill, since the amount of land subject to expropriation would have been reduced to a trifling area. That the predictions of competent observers should be so completely and suddenly falsified shows that the Chancellor must have brought the whip down sharply on the parties of the *bloc*, just as he did in the crisis in the Reichstag some months ago. Prince von Bülow offers a shred of comfort to the opponents of the law in the form of a promise that expropriation will be exercised only when absolutely necessary. Such a statement but serves to illuminate the iniquitous character of a measure which is justified by no economic reason, and which is intended to hang as a sword of Damocles over the heads of an entire population, whose only crime has been loyalty to their historic tongue and love of their native soil. Prussia's attempts at the eradication of the Poles in Posen have hitherto failed. It is difficult to believe that the new measure, for all its severity, stands any chance of success in the face of opposition not only on the part of the Prussian Poles, but of a large element among their German fellow-subjects.

Another battle between the French under Gen. d'Amade and the Moorish tribesmen, is reported to have ended in the defeat of Mulai Hafid's supporters, but not without the loss of eleven French killed and thirty-six wounded. What the loss on the other side was can only be conjectured from the fact that in the battle at Settat on February 6 the Moors lost 800 men killed to the one man killed and thirteen wounded among the French. It is increasingly evident that France is facing a serious situation in Morocco. It is no longer possible to speak of "policing" or "pacifying" the coast region, for the French have to do now with no marauding tribesmen, but a hostile army, which, according to the reports of French war correspondents, seems to show a fair measure of discipline and high courage and determination. Gen. d'Amade was thought to have performed a notable piece of work in fighting his way from Dar Ber Rechid southward to Settat in the five days of February 2-6, yet the distance was only some twenty-five miles. Opposed to him he had a force of 8,000 tribesmen, provided with a few field-pieces and what appears to be a regular commissary system. The report that Gen. Lyautey, of Algerian fame, is to replace Gen. d'Amade would indicate that the French government realizes that it has on hand something much like war.

Last week the Italian Chamber of Deputies defeated by a large majority a Socialist resolution in favor of the abolition of religious instruction in the public schools. The Socialists were supported by the Radical Republicans and a few dissident Conservatives, and it is not probable that they will accept their defeat as final. The anti-clerical movement is too strong for that. In regard to this particular question of secularizing the schools it is significant that the Italian school teachers should constitute one of the most militant factors. The situation is parallel to that in France, where the associations of schoolmasters have shown themselves deeply imbued with revolutionary doctrines. In both countries such conditions have given rise to pessimistic opinion in Conservative circles, where it is feared that Socialism may use its powers over the schools as unsparingly as the Catholic Church has done in the past.

A REAL GOVERNMENTAL CHANGE.

Secretary Taft easily maintained, in his address to the Brooklyn Bar Association on Saturday night, that there has been no impairment of the Constitution by judicial construction. On paper, and read in the light of court decisions, the division of powers prescribed in that national charter remains intact. Whether the inquiry be respecting the demarcation between the functions of the States and those of the Federal government, or the prerogatives and duties of the different branches of that government, Mr. Taft asserted that the judges have steadily seen to it that no serious departure has been allowed from the general scheme of the Constitution. This may be and probably is true; yet it is another question whether great changes in actual practice under the Constitution may not have insensibly stolen upon us. To detect them is very hard for contemporaries. With the written theory remaining what it always has been, we do not perceive how far away from it the unwritten fact has wandered. It is like the diagnosis of certain diseases. The patient does not know what is the matter with him till he is dead. It takes a post mortem to reveal the truth. And there are Constitutional post mortems, continually held by historians, which discover changes that people knew not when they walked therein.

Even contemporaries, however, are able to note the beginnings of silent innovation. Of all of its bearings, they may be but dimly aware, yet they can see that a real change is slowly taking place. One such was not touched upon at all by Secretary Taft, but it lies upon the surface of English politics to-day, and is clearly discernible in our own. We mean the greatly heightened powers of the executive government, in what relates to legislation. In England, the initiative of private members of Parliament has almost entirely disappeared. All the important bills are now government measures, and the government is claiming and getting more and more of the time of the House of Commons. This is a profound change, and represents an entire dislocation of the literary theory of the British Constitution, a hundred and twenty years ago. But a similar alteration of inherited practice is rapidly invading this country also. The Executive as Legislator is now a familiar figure among us. President Roosevelt is not the only exemplar. Governor after Governor has been making of himself the chief fountain of legislation in his State. There is no more suggestive sign of the times. East as well as West, the phenomenon presents itself. Gov. La Follette in Wisconsin has been imitated by Gov. Johnson of Minnesota and Gov. Hoch of Kansas. To the initiative of Gov. Hughes of New York comes an immediate response from Gov. Woodruff of Connecticut and Gov. Fort of New Jersey. All of them press critical matters upon their Legislatures. All of them tacitly assume that the Governor must intervene with prompting and public advocacy of important legislation, or else it will fail. Nor is this attitude much resented by Legislature or Congress. As for the people, they accept it enthusiastically.

Yet how deep a breach with the old ideas and historic practice all this represents, every one must see who stops to think. The jealous isolation of the Executive, in all that relates to law-making (except assent to new statutes), is one of the most vital traditions of Anglo-Saxon constitutional law. Turn, for example, to this resolution, which was adopted by the House of Commons on December 17, 1783:

> To report any opinion or pretended opinion of His Majesty upon any bill or other proceeding depending in either House of Parliament, with a view to influencing the votes of the members, is a high crime and misdemeanor, derogatory to the honor of the Crown, a breach of the fundamental privilege of Parliament, and subversive of the Constitution of the country.

Contrast this with the constant appeal, nowadays, to the wishes of President or Governor; with the direct activity of Executives not only in recommending legislation but in sending for members of Congress or of the Legislature to urge them to vote for particular measures; and we begin to understand how long is the road we have travelled.

How does all this fit into the democratic theory? What does it signify in regard to representative institutions? It would be rash to attempt a full and satisfying answer to these questions. We are too near the political development, too much a part of it, to detach ourselves and pass judgment upon it conclusively. Partial answers, however, we may find in the very facts under discussion. It is clear, to begin with, that Congressmen and members of the Legislature are becoming more strictly *local* representatives. They cannot see beyond their districts. Few of them are nationally-minded or State-minded. In large affairs, affecting all the people, they have lost their initiative, because their time and strength are taken up with the petty interests of their immediate constituents. For them, they run errands, seek offices, work for local appropriations. Somebody else has to take the broad view, to look after the nation or the State, while they are absorbed with Buncombe County or Podunk. An this somebody is getting to be more and more the directly elect of all the people. To a President, or Governor, thus chosen, all the people are coming to look increasingly, not merely for administration, but for impulse and driving power in legislation. They may be no wiser than the nominal legislators, but they have a wider outlook, and they feel mightier impulses from the whole citizenship pushing them on. Hence, it is no trouble for democracy to adjust itself to the new practice. Choosing the Executive directly, it chooses him now to be the chief medium of progressive and reformatory law-making. If it gets its will done, it cares little about the instrument. "After all," said Mr. Balfour, when defending his plan to take power from the House for the government, "we are no longer fighting the Crown." And if American Congresses and Legislatures are leaving off fighting the Executive, it is because the Executive has come best to represent the whole people.

WHY NEW YORK IS DOUBTFUL.

Gen. Stewart L. Woodford declared in Boston the other day that New York must be reckoned this year as a highly doubtful State. Similar assertions have been publicly made by Seth Low. Other New York Republicans, favoring the nomination of Hughes at Chicago, are free to express the same opinion. It may be said, it doubtless is said, that this is only an ingenious and not wholly sincere way of building up an argument for the Hughes candidacy. But facts are facts, no matter to whose advantage the inference from them falls out; and it is the business of serious men to consult the facts, not their dreams or hopes. Those who feel with us that the election of Bryan would be a public misfortune, must not shut their eyes to the truth that it will be no easy task for a Republican to beat him in New York. We must not incur the reproach which Carlyle addressed to the Irish, when he alleged of them that their habit was to say to the hard fact: "Thou art not *that* way but *this*."

There is no denying, to begin with, that New York is normally a Democratic State. Only exceptional circumstances enable the Republicans to carry it. Bryan flung it away in 1896, but even after his defeat by more than 200,000, the tendency to drift back was shown in 1898 when Roosevelt, with all the glamour of the Spanish war upon him, was elected Governor by less than 20,000. Again in 1904 New York was triumphantly carried for Roosevelt, but two years later every Democrat on the ticket except Hearst was elected. The fierce personal cutting to which Hearst was subjected in Brooklyn and this city, combined with the confidence which Hughes succeeded in inspiring, alone gave the State a Republican Governor.

Since then, what has the Republican party as such done in New York, what have the organization leaders done, to retain that support of independent voters without which, as Mr. Low frankly admits, the State cannot be held against the Democrats? The answer is that they have done little except to furnish aid and comfort to the enemy. They have stood sullenly athwart the efforts of their own reforming Governor. Consider the proceedings in the Kelsey case. They look, according to a high Republican authority, almost like a deliberate attempt to turn New York over to the Democrats. The question was put to one of the Republican Senators at Albany whether the retention of Kelsey would not be a great help to the Democratic party. He cynically replied: "Oh, it will be only one thing more." On top of this, the fact cannot be blinked that the Republican party in New York is torn by factional quarrels and disgraced by a peculiarly offensive set of local bosses. A ferocious contest has already been begun for the control of the State Committee. And when one contemplates the spectacle of Boss Barnes in Albany "delivering" his two Senators against the Governor, and Woodruff in Kings, Ward in Westchester, and Aldridge in Monroe performing their antics, with Odell resuming his sinister activities, the attitude of the Republican machine is seen to be one to flout and repel independent voters, instead of attracting them.

Ah, but "anybody can beat Bryan in New York!" The *World* says that he could not carry the State even if 100,000 Republicans should stay at home. But this is to argue as if nothing had changed since 1896 and 1900. It was the silver issue which in those years piled up the enormous majorities against Bryan. In 1900, the prosperity argument also made against him. "I have observed," said President McKinley, after the election of that year, "that majorities rise as prosperity rises." He would not have denied that they sink as it falls. This year, the prosperity argument will bear hard against the Republicans. Say what they will, they cannot get away from it. Out of their own mouths they will stand condemned. This is one of the great changes in outward things which must affect the politics of New York, as of the rest of the country. And the silver issue is dead. It will not again throw this State into the arms of a Platt. If it be urged that the Republicans can find a bogey just as good in Bryan's other radical and unsettling proposals, the reply is that they have, by force of contrast with a Republican President's, lost their power to startle.

Gen. Woodford is right. New York is a doubtful State. With the intense unpopularity of the Roosevelt Administration in this city, a united, greedy, and powerful Tammany, the discontented vote swollen to great proportions, the difficulty of financing a Republican campaign—with all these things taken into the account, it is folly to deny that a great majority for Bryan may be rolled up in Greater New York. Political managers may as well face the situation. Some Republicans are saying that they can elect a President without New York. That is mathematically possible, of course, but no politician in his senses would plan a campaign which began by conceding New York to the Democrats. The big fight will be here. Bryan makes that plain. He must have this State if he is to succeed, and will put forth tremendous exertions to get it. Who could go forth to give him battle with the best chance of victory? Ask any disinterested and sagacious man in New York, and he will tell you—Hughes.

PHYSICAL VALUATION OF RAILWAYS.

The project for a physical valuation of railway properties, a project which a group of Senators is striving to graft on the Aldrich currency bill, seems to be exciting more interest than the original measure. According to the latest reports, the proviso will contain merely the requirement that the specific property mortgaged by a railroad shall be officially valued before the mortgage bonds are accepted as security for emergency currency. "In this form," reports one correspondent, "the amendment would answer all the objections presented by those who maintain that good business methods demand that the government shall not accept a mortgage on property the actual value of which it does not know."

In the last number of the *Political Science Quarterly* Prof. William Z. Ripley summarizes in some detail the contentions on both sides of the question. This movement for physical valuation is, as he points out, an inevitable outgrowth of the general commitment of State and national authorities to the principle of government regulation of public utilities. The power to regulate cannot be exercised intelligently without adequate information. Most regulative laws contain provisions for opening of the books of the railways and requiring detailed reports of operations. Says Professor Ripley:

> That some valuation of the property or investment of railroads is not only theoretically, but also practically, a prerequisite to the determination of reasonableness of rates is demonstrated by three facts. In the first place, such valuation is commonly introduced by the railroad attorneys themselves as a main line of defence against proposed reductions. The direct issue of valuation has thus time after time been forced upon the public at the initiative of the carriers. Secondly, as thus presented, it has frequently been adopted by administrative commissions as a basis for the determination of rate controversies. And, finally, with the supersession of administrative by judicial settlement, the courts also have been forced to consider the same line of argument and, in fact, to treat it as fundamental.

The question remains, shall there be a physical or a commercial valuation? The one is made by engineers and appraisers in the field, piecemeal, rails, stations, rolling stock, as a merchant would make an inventory of his goods at the close of the year. The other is made on a basis primarily of the securities and their selling prices, treats the entire property as a unit, and necessarily reckons in all sorts of potentialities favorable and unfavorable, "good will" and franchise.

The objection offered to the plan of physical valuation, aside from the great practical difficulties of making it accurately, is that the information it affords is of no real use. Having to deal with two lines of equal length, one built in level, open country, and connecting, say, a prosperous agricultural region with a great city, the other located, through bad judgment, in a mountainous region, in the expectation of developments which never came, the physical valuer would appraise the latter at the higher figure. Rates are not determined on a basis of physical value. The totals, therefore, are of no help to the official who desires to deal fairly between carrier and shipper, though they are eagerly caught up by demagogues who will at once proceed to treat the railways as if physical value were the same thing as total value. "The value of a railroad, viewed as a single asset," says a recent writer in the *Atlantic*, "is its earning power capitalized, and nothing else whatever."

The reply is, in substance, that if the value of a railway is simply its earning power capitalized, then the interest of the public can make no headway at all. If high rates justify large capitalization, and large capitalization justifies high rates, statesmanship and finance alike are caught in a vicious circle. Rates must not be touched, because they are necessary for a respectable return on the capitalization; capitalization must not be touched, because it is justified by earnings under the existing rates. The science of rate-making, as most of the proponents of this view admit, is as yet undeveloped, but they say it never will be developed until all obtainable facts are in possession of the authorities responsible for transforming a new political doctrine into orderly practice.

These, substantially, are the chief arguments pro and con. As in the case of so many other mooted Federal questions, it turns out that individual States have tried on their own accounts the policies proposed at Washington. Texas, Michigan, and Wisconsin have made physical valuations of their railways, as Professor Ripley remarks, "without overturning the institution of private property." They took up the policy—as New Jersey is likely to do this year—not so much with a view to regulating either rates or stock issues, as with a view to equal taxation. In this connection, Senator Everett Colby's advertisements directing attention to the inequality of taxes paid on a railway main-stem and a taxpayer's cottage will be remembered. Michigan found in 1900 the commercial value of her railroads per mile to be $32,100, the physical value in present condition $21,500, and the cost of reproduction $26,100. Wisconsin in 1903 appraised commercial valuation at $40,400 per mile, present condition at $25,500, and cost of reproduction $30,900; while Texas in 1906, not attempting to set a present value, found the commercial valuation to be $20.100 per mile, and cost of reproduction $16,531.

Professor Ripley has small patience with the view that "vast and unknown possibilities of evil" are involved in the physical valuation plan. The trouble is that the possibilities of good are little more definite. He says:

> The plan of valuation under consideration, he says, seeks not to find the *total* value at all, but to discover *what part of it is represented by real property, and what part by intangible assets.*

This knowledge, practically irrelevant to the fixing of a particular rate, becomes important, he believes, when the general level of rates is to be considered. The States which have procured it, however, as we have seen, did so with a different object chiefly in view, namely, the imposition of direct taxes, in which the Federal government has no concern.

THE SITUATION IN RUSSIA.

Cable dispatches from Russia during the last three months have brought news radically different from that which came out of St. Petersburg during the three years preceding. The word "Duma" does not occur very often; "revolution," "agrarian," "suffrage," and "popular liberties" are mentioned still more rarely. Death sentences and conspiracy, on the other hand, are frequent. We seem to be back with conditions and terms of five years ago. The dispatches tell of projects for a new billion-dollar navy, of an active Near East policy in connection with Macedonia, of an active Middle East policy in connection with Persia, of renewed aggression in Manchuria, and of a threatened resumption of the policy of autocratic officialism in Finland. It is apparently the old Russia of the days of Von Plehve and Grand Duke Sergius. The failure of the revolution is acknowledged by the revolutionists themselves. The third Duma is still in session at St. Petersburg, but to the great majority of those who made parliamentary life in Russia possible, the Landlord's Duma is a matter of profound indifference. If anything were needed to render it absolutely futile in the public mind, it would be the Czar's declaration to his loyal deputies at last week's formal meeting. I am content with you, the Czar practically told them; you have learned to work in harmony with the government. Interpreted, that means, of course, "You have learned to take orders quietly from the government."

The rise and fall of the Russian revolution of 1905-7 was admirably summarized by David Macgowan, a correspondent of experience, in the columns of the New York *Evening Post* more than two weeks ago. The St. Petersburg massacre of January 22, 1905, was the dramatic beginning of a struggle that ended with the dissolution of the second Duma in June, 1907. The character of the struggle is thus outlined by Mr. Macgowan:

> After six months' preparatory work, all of Russia's thinking citizenship was brought to and kept at fever heat for twelve months. An unexampled conspiracy of brain and brawn paralyzed the government's arm, inspired a nameless dread, and won a great victory—at the cost of the country's nervous energy. The thunderbolt was spent, and all too frequent and all too local flashes drained the rain-clouds of their menace. Still, fear froze the government's marrow for six months more.

And when the government had regained courage, it dispersed the second Duma, threw away the old electoral law, and secured the election of the present Duma. Failure had come through the lack of popular education, the lack of discipline, but most of all, as Mr. Macgowan has it, through exhaustion. Human nature has its limits of endurance. The Russian temperament, in its habitual oscillation from extremes of energy and self-assertion to extremes of passive resignation, made it inevitable that a period of dazzling revolutionary triumphs should be followed by a period of profound depression.

Nor was this all of it. Liberal and revolutionary Russia practically starved itself into defeat. The contest against the government was in the beginning a national one, in the sense that all classes of enlightened Russian society made common cause against the autocracy. Judges, lawyers, and physicians joined in the great strike of October, 1905; and employers sympathized with their striking workmen, because it was an iniquitous political system that the workingmen were protesting against. But when the Constitution of October 30 had been gained, when the revolutionary leaders, carried away by their unexpected victories, swept on towards glorious visions of social reconstruction for Russia and Europe, there ensued a period of labor warfare which did much to intensify the depression of Russian industry induced by the war with Japan. The factory population in the Russian towns attempted by means of the strike and "direct action" to raise themselves to a level attained by the wage-earners of no other country in the world. Incessant strikes resulted only in the ruin of employers and increased misery for the laboring classes. At the present moment western Russia suffers from lack of employment, a high cost of living, and empty stomachs.

If revolution has failed, is it equally correct to speak, as we often do now, of reaction as triumphant in Russia? That depends on the meaning we give the term. If we mean a reaction from the high hopes and apparently high achievements of the days of the first Duma, the answer has already been given. But if by reaction we mean a return to conditions just as they were before the outbreak of the war with Japan, then the Czar's Empire, in spite of pessimistic comment to the contrary, is not in the throes of reaction. The autocracy may be seemingly as absolute as ever, the police as all-powerful, and the liberties of speech and press yet rigorously controlled; but it is impossible to deny that the Russian people think more freely and speak and write more freely than they dared before the outbreak of the Japanese war. Not even the sternest censorship can deprive the people of what they have already heard and read and learned; and that stock of ideas and experiences gathered during the last three years should be enough to leaven the heavy Russian mass during the years of repression that seem destined to ensue.

As a final check against reaction, there is the Duma. Hated by the old régime, despised by the great body of the enlightened, it retains nevertheless the potentiality of a freer political life. The Russian has been called impracticable, and not without reason. On the other hand, people overlook the fact that the Russian has enjoyed but slight opportunity for becoming practical. Experience teaches, and experience even in a lame and almost impotent Duma may bring its lessons. The Zemstvos, or provincial councils, created under Alexander II., had only a brief period of free activity. Under Alexander III. they were maimed, bound, and given over into the hands of the bureaucracy. Yet even under such conditions the Zemstvo councils managed to nourish and develop a spirit of liberty, and a high grade of political ability which revealed itself in the course of the revolutionary struggle. If the Russian people profited by their provincial councils, they will learn to profit by the Duma. Every force that works for progress impels to that conclusion.

LONGEVITY OF LITERATURE.

The celebration of the eightieth birthday of George Meredith has set the critics to discussing his verse, and incidentally the reasons why it is less popular than his prose. A writer in the London *Times* explains by a generalization which expresses only one side of the truth. After saying that Meredith's "Love in the Valley" may be remembered at least as long as "The Egoist," the critic adds:

> "Rasselas" had in its day many more readers than "The Vanity of Human Wishes"; and Sidney was long thought of as the author of the "Arcadia," and not as the writer of the Sonnets to Stella; but in each case, for us to-day, the verse has a stronger life than the prose. The fact, perhaps, is that the pleasurable excitement afforded by metre, and the higher mood in which poetry is usually written, carry us into an atmosphere in which we are less conscious of changed fashions in thought and expression than we inevitably are in prose. There is in poetry an element of strangeness which makes us ready to welcome a certain unlikeness to our ways of speech and our own point of view. But that is not so in prose. The fancies which are delightful in Elizabethan verse are only tolerable in the contemporary prose; the conceits which we endure in Donne or Cowley would not be endured in any writer who was not a poet. Perhaps the truth is that, with contemporaries, prose has a better chance than verse, other things being equal; with posterity, other things being equal, verse has a better chance than prose.

These reasons—except, perhaps, the one implied in the phrase "higher mood"—relate to the style rather than the substance of prose and poetry. For our part, we should ascribe the longer life of poetry to the fact that it deals powerfully and beautifully with subjects of more enduring interest; more often than prose it takes hold of the eternities. The true theme of poetry is the great common emotions and those loftier meditations on life and death which appeal to us to-day as they appealed to the Elizabethans, to the Italians of Dante's day, to the contemporaries of Virgil, and to the ancient Greeks and Hebrews. If a man has the gift of writing poetry, he is likely to employ it on such topics as these, while his thoughts on matters of current or temporary import are relegated to prose. This, too, is a generalization which must not be pressed too hard; but there are many illustrations of it in our own literature.

It is significant that the popular survivals from the period preceding the year 1700 are for the most part poetry, including, of course, the drama. The mass of scientific treatises and sermons, of speculations in philosophy and religion, of books on politics and history, are, for the public at large, and even for lovers of literature, waste paper. A few exceptions stand out, like Bacon's "Essays," Walton's "Compleat Angler," and Sir Thomas Browne's writings, but the rest lie in dust and darkness. Few people are even aware that Chaucer wrote a "Treatise on the Astrolabe." Were the astrolabe still in use, the "Treatise" might still circulate in cheap reprints; but the Parson, the Clerk, the Squire, the Wife of Bath, and the other types of humanity depicted so brilliantly in the "Canterbury Tales" are dwelling with us yet. With Spencer it is much the same. "Very few and very weary," says Macaulay, "are those who are in at the death of the Blatant Beast"; but not one of the weary readers of "The Faerie Queene" would think of undertaking the "View of the Present State of Ireland." Milton's prose fills five solid volumes of Bohn's Standard Library, but the causes for which he contended are forgotten. Now and then a sentence from the "Areopagitica" graces a magazine article; but who Salmasius and Smectymnuus were, and why Milton fell into such violent language, are matters of profound indifference to the twentieth century. Dryden's prose—three volumes in Malone's edition—is often described as the first really modern English prose. As such it is justly admired by professed students of literature. But the world at large cares nothing for the theories of dramatic art which Dryden propounds in the "Essay of Dramatic Poesy," nothing for the "Discourse on Epick Poetry," nothing for "A Parallel of Poetry and Painting." And the world, we may add, cares as little for the verse in "Absalom and Achitophel," "Religio Laici," and "The Hind and the Panther." They were tracts for Dryden's times; and not all the skill of the greatest poet of that age can make them tracts for ours.

Passing to the eighteenth and nineteenth centuries, we find, first of all, Swift and Defoe, both writing verse and prose, and both surviving in their prose rather than their verse. But their prose has lived and their verse has died for the same reason that Milton's verse has lived while his prose has died. Swift's political and personal skits, like Defoe's "True-born Englishman," "Jure Divino," and "Caledonia," with all their vigor of phrase, are nearer the stuff of prose than "Gulliver's Travels" and "Robinson Crusoe"; for these immortal tales have not a little of the epic quality. Goldsmith's prose and his verse seem to enjoy almost equal favor; Cowper's letters certainly compete with his poems; and Scott's "Heart of Midlothian" holds its own with "The Lady of the Lake." But in addition to the Waverley Novels there are twenty-eight volumes of Scott's prose which are seldom opened. The prose of Wordsworth and Coleridge is likewise disappearing. No one reads Wordsworth's "Convention of Cintra" and "Guide to the Lakes," and his several prefaces, as well as Coleridge's critical writings, are food only for the student and specialist. In another hundred years also they may be put on the upper shelf with Dryden's "Essay of Dramatic Poesy." Later authors we need not discuss; for they are too close to us for clear judgment.

These several examples, if they show anything, indicate that the prose of our poets, as well as the poetry of our prose writers, falls short not so much in point of style as in matter. A book perishes because the theme which engaged the author is not vital. On no other theory can we account for the attraction which Homer, Virgil, and Dante still exercise in translations, often prose translations, the style of which is destitute of distinction. All the aroma and much of the flavor have vanished in the passage from one language to another; but beneath the fleeting felicities of the style is the perdurable substance. We must conclude, then, that Hazlitt (like the critic in the *Times*) had lost sight of the main issue when he declared:

> Poets are winged animals, and can cleave the air, like birds, with ease to themselves and delight to the beholders; but like those "feathered, two-legged things," when they light upon the ground of prose and matter-of-fact, they seem not to have the same use of their feet.

An aspect of the case at which we have but hinted is the development of the novel as a sort of successor to the Elizabethan drama. The Elizabethan novel, Sidney's "Arcadia," Lyly's "Euphues," Nash's "Unfortunate Traveller," Lodge's "Rosalynde," and all the rest are now merely curiosities. But the plays are still presented on the stage. From the beginning of the eighteenth century, however, the prose which has retained anything like popularity is chiefly fiction. We have mentioned "Gulliver" and "Crusoe." A little later come Fielding, Sterne, Smollett, Goldsmith, and Miss Burney, and so on down to our own day. Surely, it is not the style—the form as distinct from the essence—which has preserved these novels; rather, it is the fact that, like the Elizabethan drama and the highest poetry, they have had the essence. They have dealt not with the externals and accessories of life, not with modes of government, controversies in church and state, discussions of science and art; but directly and forcibly with life itself, the elemental fears and hopes and passions that are the same yesterday, to-day, and forever.

PARIS BOOK NOTES.

Paris, February 15.

The week has given us two literary works of prime actuality. Each seems to be its author's appeal to posterity—with what success time only can disclose.

Anatole France, after many years of study and tentative publication, at last presents the first volume of his definitive "Vie de Jeanne d'Arc"—553 octavo pages, with 83 more of defensive preface. The first impression of the book is uncertain. There can be no doubt of the greatness of the author's effort. Long since he reached the maturity of his literary powers; and, for particular reasons, almost partisan, his later fame has been overshadowing. Only a "treasure for aye" can now justify the expectations which have been aroused.

The style, in large sense—that which has been always the first thing to consider in Anatole France—is not now, at least not as a rule, that acrid scarifying of Church and tradition to which his Dreyfus period accustomed us. It is not the smiling, cynical skepticism, out-Renaning Renan, of his previous "Monsieur Bergeret." It is not even a return to the kindly, undisabused writing which earned his earliest fame. No need to say that it is good Anatole France; but there is obvious preoccupation in it, studious reserves, and artificial enthusiasms, to guard against the thought's offence. The avowed aim of the book is to make the reader think himself back into the state of mind of Joan of Arc's contemporaries and thus, with no twentieth-century sidelights, to see her as she lived and acted in the real world. The erudition for such a process is ostensibly in the author's possession. The use of it, quite as ostensibly, is guided by "science," surely no fifteenth-century light. That Joan had hallucinations of hearing and sight, of touch and smell, is a conclusion of present-day professors of *psychiatrie*. Zola, whose mental discipline and learning were vastly inferior, used similar conclusions of science, but he applied them to creatures of his own imagination. We may admire such intellectual feats as difficult; they leave us with little feeling of mental security. To reassure any reader who might fear a recurring offence of the broad moral complacencies of Abbé Jérôme Coignard and Monsieur Bergeret, their creator announces in an interview that he has sedulously not used many inviting documents. Such are the records of the crude witness borne by the soldiery to Joan's chaste influence among them; yet these have significant bearing on the "commonsense" history of Joan by her chief blasphemer, Voltaire. In general, this Life of Joan of Arc corresponds, in aim and likely effect, with Renan's Life of Jesus; but in substance, and taking no account of its literary brilliance, it belongs to a newer day, and is nearer to ex-Abbé Loisy's treatment of the Gospel story.
